

## Water memory and homeopathy

MB can form a model for a bio-active molecule as MB with flux tubes of the water cluster with size proportional to  $h_{eff}$  possessing **cyclotron frequencies** equal to those generated by the molecule or its MB (as cyclotron frequencies). This would define a water memory representation of molecule as a “**fake**” molecule. The cyclotron frequencies (and also other frequencies) serve as a **recognition mechanism**. One has frequency and energy resonance between systems with same  $h_{eff}$  and only energy resonance for different frequencies (<http://tinyurl.com/rw9jzcp>).

Besides mimicing the invader molecule the fake molecule can even **catch the invader** by forming a reconnection by a U-shaped flux tube acting as tentacle water. This could represent the simplest form of **immune system**. Chemistry would give rise to more refined elimination mechanisms.

Also **homeopathy** could be understood. Fake molecules would have same bio-effects on living matter as real ones. They would activate immune system and generate immune reponse. The shaking of the water bottle after dilution would provide metabolic energy allowing the population of fake molecules to increase in size ( $h_{eff}$  must be increased and this requires metabolic energy provided by the agitation). Homeopathic effects could reproduced also by recording the cyclotron frequencies of the molecule and irradiating water using these frequencies.

This would make possible new kind of **medicine based on frequencies** and not involving chemistry with all its side effects.
