## 0.1 PREFACE

### Brief summary of TGD

Towards the end of the year 2023 I became convinced that it would be appropriate to prepare collections about books related to TGD and its applications. The finiteness of human lifetime was my first motivation. My second motivation was the deep conviction that TGD will mean a revolution of the scientific world view and I must do my best to make it easier.

The first collection would relate to the TGD proper and its applications to physics. Second collection would relate to TGD inspired theory of consciousness and the third collection to TGD based quantum biology. The books in these collections would focus on much more precise topics than the earlier books and would be shorter. This would make it much easier for the reader to understand what TGD is, when the time is finally mature for the TGD to be taken seriously. This particular book belongs to a collection of books about TGD proper.

### The basic ideas of TGD

TGD can be regarded as a unified theory of fundamental interactions but is not the kind of unified theory as so called GUTs constructed by graduate students in the seventies and eighties using detailed recipes for how to reduce everything to group theory. Nowadays this activity has been completely computerized and it probably takes only a few hours to print out the predictions of this kind of unified theory as an article in the desired format. TGD is something different and I am not ashamed to confess that I have devoted the last 45 years of my life to this enterprise and am still unable to write The Rules.

If I remember correctly, I got the basic idea of Topological Geometroynamics (TGD) during autumn 1977, perhaps it was October. What I realized was that the representability of physical space-times as 4-dimensional surfaces of some higher-dimensional space-time obtained by replacing the points of Minkowski space with some very small compact internal space could resolve the conceptual difficulties of general relativity related to the definition of the notion of energy. This belief was too optimistic and only with the advent of what I call zero energy ontology the understanding of the notion of Poincare invariance has become satisfactory. This required also the understanding of the relationship to General Relativity.

It soon became clear that the approach leads to a generalization of the notion of space-time with particles being represented by space-time surfaces with finite size so that TGD could be also seen as a generalization of the string model. Much later it became clear that this generalization is consistent with conformal invariance only if space-time is 4-dimensional and the Minkowski space factor of the embedding space is 4-dimensional. During last year it became clear that 4-D Minkowski space and 4-D complex projective space  $CP_2$  are completely unique in the sense that they allow twistor space with Kähler structure.

It took some time to discover that also the geometrization of also gauge interactions and elementary particle quantum numbers could be possible in this framework: it took two years to find the unique internal space ( $CP_2$ ) providing this geometrization involving also the realization that family replication phenomenon for fermions has a natural topological explanation in TGD framework and that the symmetries of the standard model symmetries are much more profound than pragmatic TOE builders have believed them to be. If TGD is correct, the mainstream particle physics chose the wrong track leading to the recent deep crisis when people decided that quarks and leptons belong to the same multiplet of the gauge group implying instability of the proton.

Instead of trying to describe in detail the path, which led to TGD as it is now with all its side tracks, it is better to summarize the recent view which of course need not be final.

TGD can be said to be a fusion of special and general relativities. The Relativity Principle (Poincare Invariance) of Special Relativity is combined with the General Coordinate Invariance and Equivalence Principle of General Relativity. TGD involves 3 views of physics: physics geometry, physics as number theory and physics as topological physics in some sense.

## Physics as geometry

"Geometro-" in TGD refers to the idea about the geometrization of physics. The geometrization program of Einstein is extended to gauge fields allowing realization in terms of the geometry of surfaces so that Einsteinian space-time as abstract Riemann geometry is replaced with sub-manifold geometry. The basic motivation is the loss of classical conservation laws in General Relativity Theory (GRT)(see **Fig. 23**). Also the interpretation as a generalization of string models by replacing string with 3-D surface is natural.

- Standard model symmetries uniquely fix the choice of 8-D space in which space-time surfaces live to  $H = M^4 \times CP_2$  [L69]. Also the notion of twistor is geometrized in terms of surface geometry and the existence of twistor lift fixes the choice of  $H$  completely so that TGD is unique [L13, L18](see **Fig. 24**). The geometrization applies even to the quantum theory itself and the space of space-time surfaces - "world of classical worlds" (WCW) - becomes the basic object endowed with Kähler geometry (see **Fig. 25**). The mere mathematical existence of WCW geometry requires that it has maximal isometries, which together twistor lift and number theoretic vision fixes it uniquely [L71].
- General Coordinate Invariance (GCI) for space-time surfaces has dramatic implications. A given 3-surface fixes the space-time surface almost completely as analog of Bohr orbit (preferred extremal). This implies holography and leads to zero energy ontology (ZEO) in which quantum states are superpositions of space-time surfaces [K100, L28].
- From the beginning it was clear that the theory predicts the presence of long ranged classical electro-weak and color gauge fields and that these fields necessarily accompany classical electromagnetic fields in all scales. It took about 26 years to gain the maturity to admit the obvious: these fields are classical correlates for long range color and weak interactions assignable to the phases of ordinary matter predicted by the number theoretic vision and behaving like dark matter but identifiable as matter explaining the missing baryon problem whereas the galactic dark matter would correspond to the dark energy assignable monopole flux tubes as deformations of cosmic strings. The only possible conclusion is that TGD physics is a fractal consisting of an entire hierarchy of fractal copies of standard model physics. Also the understanding of electro-weak massivation and screening of weak charges has been a long standing problem and p-adic physics solved this problem in terms of p-adic thermodynamics [K19, K46] [L53].
- One of the most recent discoveries of classical TGD is exact general solution of the field equations. Holography can be realized as a generalized holomorphy realized in terms of what I call Hamilton-Jacobi structure [L62]. Space-time surfaces correspond to holomorphic imbeddings of the space-time surface to  $H$  with a generalized complex structure defined by the vanishing of 2 analytic functions of 4 generalized complex coordinates of  $H$ . These surfaces are automatically minimal surfaces. This is true for any general coordinate invariant action constructed in terms of the induced geometric structures so that the dynamics is universal. Different actions differ only in the sense that singularities at which the minimal surface property fails depend on the action. This affects the scattering amplitudes, which can be constructed in terms of the data related to the singularities [L78].
- Generalized conformal symmetries define an extension of conformal symmetries and one can assign to them Noether charges. Besides this the so called super-symplectic symmetries associated with  $\delta M_+^4 \times CP_2$  define isometries of the "world of classical worlds" (WCW), which by holography is essentially the space of Bohr orbits of 3-surfaces as particles so that quantum TGD is expected to reduce to a generalization of wave mechanics.

## Physics as number theory

During these years TGD led to a rather profound generalization of the space-time concept. Quite general properties of the theory led to the notion of many-sheeted space-time with sheets representing physical subsystems of various sizes. At the beginning of 90s I became dimly aware of the

importance of p-adic number fields and soon ended up with the idea that p-adic thermodynamics for a conformally invariant system allows to understand elementary particle massivation with amazingly few input assumptions. The attempts to understand p-adicity from basic principles led gradually to the vision about physics as a generalized number theory as an approach complementary to the physics as an infinite-dimensional spinor geometry of WCW approach. One of its elements was a generalization of the number concept obtained by fusing real numbers and various p-adic numbers along common rationals. The number theoretic trinity involves besides p-adic number fields also quaternions and octonions and the notion of infinite prime.

Adelic physics [L11, L12] fusing real and various p-adic physics is part of the number theoretic vision, which provides a kind of dual description for the description based on space-time geometry and the geometry of "world of classical words". Adelic physics predicts two fractal length scale hierarchies: p-adic length scale hierarchy and the hierarchy of dark length scales labelled by  $h_{eff} = nh_0$ , where  $n$  is the dimension of extension of rational. The interpretation of the latter hierarchy is as phases of ordinary matter behaving like dark matter. Quantum coherence is possible in arbitrarily long scales. These two hierarchies are closely related. p-Adic primes correspond to ramified primes for a polynomial, whose roots define the extension of rationals: for a given extension this polynomial is not unique.

### $M^8 - H$ duality

The concrete realization of the number theoretic vision is based on  $M^8 - H$  duality (see **Fig. 26**). What the precise form is this duality is, has been far from clear but the recent form is the simplest one and corresponds to the original view [L73].  $M^8$  corresponds to octonions  $O$  but with the number theoretic metric defined by  $Re(o^2)$  rather than the standard norm and giving Minkowskian signature.

The physics in  $M^8$  can be said to be algebraic whereas in  $H$  field equations are partial differential equations. The dark matter hierarchy corresponds to a hierarchy of algebraic extensions of rationals inducing that for adeles and has interpretation as an evolutionary hierarchy (see **Fig. 27**). p-Adic physics is an essential part of number theoretic vision and the space-time surfaces are such that at least their  $M^8$  counterparts exists also in p-adic sense. This requires that the analytic function defining the space-time surfaces are polynomials with rational coefficients.

$M^8 - H$  duality relates two complementary visions about physics (see **Fig. 28**), and can be seen as a generalization of the momentum-position duality of wave mechanics, which fails to generalize to quantum field theories (QFTs).  $M^8 - H$  duality applies to particles which are 3-surfaces instead of point-like particles.

### p-Adic physics

The idea about p-adic physics as physics of cognition and intentionality emerged also rather naturally and implies perhaps the most dramatic generalization of the space-time concept in which most points of p-adic space-time sheets are infinite in real sense and the projection to the real imbedding space consists of discrete set of points. One of the most fascinating outcomes was the observation that the entropy based on p-adic norm can be negative. This observation led to the vision that life can be regarded as something in the intersection of real and p-adic worlds. Negentropic entanglement has interpretation as a correlate for various positively colored aspects of conscious experience and means also the possibility of strongly correlated states stable under state function reduction and different from the conventional bound states and perhaps playing key role in the energy metabolism of living matter.

If one requires consistency of Negentropy Maximization Principle with standard measurement theory, negentropic entanglement defined in terms of number theoretic negentropy is necessarily associated with a density matrix proportional to unit matrix and is maximal and is characterized by the dimension  $n$  of the unit matrix. Negentropy is positive and maximal for a p-adic unique prime dividing  $n$ .

## Hierarchy of Planck constants labelling phases ordinary matter dark matter behaving like dark matter

One of the latest threads in the evolution of ideas is not more than nine years old. Learning about the paper of Laurent Nottale about the possibility to identify planetary orbits as Bohr orbits with a gigantic value of gravitational Planck constant made once again possible to see the obvious. Dynamical quantized Planck constant is strongly suggested by quantum classical correspondence and the fact that space-time sheets identifiable as quantum coherence regions can have arbitrarily large sizes. Second motivation for the hierarchy of Planck constants comes from bio-electromagnetism suggesting that in living systems Planck constant could have large values making macroscopic quantum coherence possible. The interpretation of dark matter as a hierarchy of phases of ordinary matter characterized by the value of Planck constant is very natural.

During summer 2010 several new insights about the mathematical structure and interpretation of TGD emerged. One of these insights was the realization that the postulated hierarchy of Planck constants might follow from the basic structure of quantum TGD. The point is that due to the extreme non-linearity of the classical action principle the correspondence between canonical momentum densities and time derivatives of the imbedding space coordinates is one-to-many and the natural description of the situation is in terms of local singular covering spaces of the imbedding space. One could speak about effective value of Planck constant  $h_{eff} = n \times h$  coming as a multiple of minimal value of Planck constant. Quite recently it became clear that the non-determinism of Kähler action is indeed the fundamental justification for the hierarchy: the integer  $n$  can be also interpreted as the integer characterizing the dimension of unit matrix characterizing negentropic entanglement made possible by the many-sheeted character of the space-time surface.

Due to conformal invariance acting as gauge symmetry the  $n$  degenerate space-time sheets must be replaced with conformal equivalence classes of space-time sheets and conformal transformations correspond to quantum critical deformations leaving the ends of space-time surfaces invariant. Conformal invariance would be broken: only the sub-algebra for which conformal weights are divisible by  $n$  act as gauge symmetries. Thus deep connections between conformal invariance related to quantum criticality, hierarchy of Planck constants, negentropic entanglement, effective p-adic topology, and non-determinism of Kähler action perhaps reflecting p-adic non-determinism emerges.

The implications of the hierarchy of Planck constants are extremely far reaching so that the significance of the reduction of this hierarchy to the basic mathematical structure distinguishing between TGD and competing theories cannot be under-estimated.

## TGD as an analog of topological QFT

Consider next the attribute "Topological". In condensed matter physical topological physics has become a standard topic. Typically one has fields having values in compact spaces, which are topologically non-trivial. In the TGD framework space-time topology itself is non-trivial as also the topology of  $H = M^4 \times CP_2$ . Since induced metric is involved with TGD, it is too much to say that TGD is topological QFT but one can for instance say, that space-time surfaces as preferred extremals define representatives for 4-D homological equivalence classes.

The space-time as 4-surface  $X^4 \subset H$  has a non-trivial topology in all scales and this together with the notion of many-sheeted space-time brings in something completely new. Topologically trivial Einsteinian space-time emerges only at the QFT limit in which all information about topology is lost (see **Fig. 29**).

Any GCI action satisfying holography=holomorphy principle has the same universal basic extremals:  $CP_2$  type extremals serving basic building bricks of elementary particles, cosmic strings and their thickenings to flux tubes defining a fractal hierarchy of structure extending from  $CP_2$  scale to cosmic scales, and massless extremals (MEs) define space-time correlates for massless particles. World as a set or particles is replaced with a network having particles as nodes and flux tubes as bonds between them serving as correlates of quantum entanglement.

"Topological" could refer also to p-adic number fields obeying p-adic local topology differing radically from the real topology (see **Fig. 30**).

## Zero energy ontology

TGD inspired theory of consciousness entered the scheme after 1995 as I started to write a book about consciousness. Gradually it became difficult to say where physics ends and consciousness theory begins since consciousness theory could be seen as a generalization of quantum measurement theory by identifying quantum jump as a moment of consciousness and by replacing the observer with the notion of self identified as a system which is conscious as long as it can avoid entanglement with environment. The somewhat cryptic statement “Everything is conscious and consciousness can be only lost” summarizes the basic philosophy neatly.

General coordinate invariance leads to the identification of space-time surfaces are analogous to Bohr orbits inside causal diamond (CD). CD obtained as intersection of future and past directed light-cones (with  $CP_2$  factor included). By the already described hologamphy, 3-dimensional data replaces the boundary conditions at single 3-surface involving also normal derivatives with conditions involving no derivatives.

In zero energy ontology (ZEO), the superpositions of space-time surfaces inside causal diamond (CD) having their ends at the opposite light-like boundaries of CD, define quantum states. CDs form a scale hierarchy (see **Fig. 31** and **Fig. 32**). Quantum states are modes of WCW spinor fields, essentially wave functions in the space WCW consisting of Bohr orbit-like 4-surfaces.

Quantum jumps occur between these and the basic problem of standard quantum measurement theory disappears. Ordinary state function reductions (SFRs) correspond to “big” SFRs (BSFRs) in which the arrow of time changes (see **Fig. 33**). This has profound thermodynamic implications and the question about the scale in which the transition from classical to quantum takes place becomes obsolete. BSFRs can occur in all scales but from the point of view of an observer with an opposite arrow of time they look like smooth time evolutions.

In “small” SFRs (SSFRs) as counterparts of “weak measurements” the arrow of time does not change and the passive boundary of CD and states at it remain unchanged (Zeno effect).

## Equivalence Principle in TGD framework

There have been also longstanding problems related to the relationship between inertial mass and gravitational mass, whose identification has been far from obvious.

- Gravitational energy is well-defined in cosmological models but is not conserved. Hence the conservation of the inertial energy does not seem to be consistent with the Equivalence Principle. In this framework the quantum numbers are assigned with zero energy states located at the boundaries of CDs defined as intersections of future and past directed light-cones. The notion of energy-momentum becomes length scale dependent since one has a scale hierarchy for causal diamonds. This allows to understand the non-conservation of energy as apparent.

Equivalence Principle in the form expressed by Einstein’s equations follows from Poincare invariance once it is realized that GRT space-time is obtained from the many-sheeted space-time of TGD by lumping together the space-time sheets to a region of Minkowski space and endowing it with an effective metric given as a sum of Minkowski metric and deviations of the metrics of space-time sheets from Minkowski metric. Similar description relates classical gauge potentials identified as components of induced spinor connection to Yang-Mills gauge potentials in GRT space-time. Various topological inhomogenities below resolution scale identified as particles are described using energy momentum tensor and gauge currents.

At quantum level, the Equivalence Principle has a surprisingly strong content. In linear Minkowski coordinates, space-time projection of the  $M^4$  spinor connection representing gravitational gauge potentials the coupling to induced spinor fields vanishes. Also the modified Dirac action for the solutions of the modified Dirac equation seems to vanish identically and in TGD perturbative approach separating interaction terms is not possible.

The modified Dirac equation however fails at the singularities of the minimal surface representing space-time surface and Dirac action reduces to an integral over singularities for the trace of the second fundamental form slashed between the induced spinor field and its conjugate. Also the  $M^4$  part of the trace is non-vanishing and gives rise to the gravitational coupling. The trace gives both standard model vertices and graviton emission vertices. One

could say that at the quantum level gravitational and gauge interactions are eliminated everywhere except at the singularities identifiable as defects of the ordinary smooth structure. The exotic smooth structures [L49], possible only in dimension 4, are ordinary smooth structures apart from these defects serving as vertex representing a creation of a fermion-antifermion pair in the induced gauge potentials. The vertex is universal and essentially the trace of the second fundamental form as an analog of the Higgs field and the gravitational constant is proportional to the square of  $CP_2$  radius.

- There is a delicate difference between inertial and gravitational masses. One can assume that the modes of the imbedding space spinor fields are solutions of massless Dirac equation in either  $M^4 \times CP_2$  and therefore eigenstates of inertial momentum or in  $CD = cd \times CP_2$ : in this case they are only mass eigenstates. The mass spectra are identical for these options. Inertial momenta correspond naturally to the Poincare charges in the space of CDs. For the CD option the spinor modes correspond to mass squared eigenstates for which the mode for  $H^3$  with a given value of light-proper time is a unitary irreducible  $SO(1,3)$  representation rather than a representation of translation group. These two eigenmode basis correspond to gravitational basis for spinor modes.

## Quantum TGD as a generalization of Einstein's geometrization program

I started the serious attempts to construct quantum TGD after my thesis around 1982. The original optimistic hope was that path integral formalism or canonical quantization might be enough to construct the quantum theory but it turned that this approach fails due to the extreme non-linearity of the theory.

It took some years to discover that the only working approach is based on the generalization of Einstein's program. Quantum physics involves the geometrization of the infinite-dimensional "world of classical worlds" (WCW) identified as the space of 3-dimensional surfaces. Later 3-surfaces were replaced with 4-surfaces satisfying holography and therefore as analogs of Bohr orbits.

- If one assumes Bohr orbitology, then strong correlations between the 3-surfaces at the ends of CD follow and mean holography. It is natural to identify the quantum states of the Universe (and sub-Universes) as modes of a formally classical spinor field in WCW. WCW gamma matrices are expressible in terms of oscillator operators of free second quantized spinor fields of  $H$ . The induced spinor fields identified projections of  $H$  spinor fields to the space-time surfaces satisfy modified Dirac equation for the modified Dirac equation. Only quantum jump remains the genuinely quantal aspect of quantum physics.
- Quantum TGD can be seen as a theory for free spinor fields in WCW having maximal isometries and the generalization of the Super Virasoro conditions gives rise to the analog massless Dirac equation at the level of WCW.

## The world of classical worlds and its symmetries

The notion of "World of Classical Worlds" (WCW) emerged around 1985 but found its basic form around 1990. Holography forced by the realization of General Coordinate Invariance forced/allowed to give up the attempts to make sense of the path integral.

A more concrete way to express this view is that WCW does not consist of 3-surfaces as particle-like entities but almost deterministic Bohr orbits assignable to them as preferred extremals of Kähler action so that quantum TGD becomes wave mechanics in WCW combined with Bohr orbitology. This view has profound implications, which can be formulated in terms of zero energy ontology (ZEO), solving among other things the basic paradox of quantum measurement theory. ZEO forms also the backbone of TGD inspired theory of consciousness and quantum biology.

WCW geometry exists only if it has maximal isometries: this statement is a generalization of the discovery of Freed for loop space geometries [A6]. I have proposed [K40, K20, K98, K72, L71] that WCW could be regarded as a union of generalized symmetric spaces labelled by zero modes which do not contribute to the metric. The induced Kähler field is invariant under symplectic transformations of  $CP_2$  and would therefore define zero mode degrees of freedom if one assumes

that WCW metric has symplectic transformations as isometries. In particular, Kähler magnetic fluxes would define zero modes and are quantized closed 2-surfaces. The induced metric appearing in Kähler action is however not zero mode degree of freedom. If the action contains volume term, the assumption about union of symmetric spaces is not well-motivated.

Symplectic transformations are not the only candidates for the isometries of WCW. The basic picture about what these maximal isometries could be, is partially inspired by string models.

- A weaker proposal is that the symplectomorphisms of  $H$  define only symplectomorphisms of WCW. Extended conformal symmetries define also a candidate for isometry group. Remarkably, light-like boundary has an infinite-dimensional group of isometries which are in 1-1 correspondence with conformal symmetries of  $S^2 \subset S^2 \times R_+ = \delta M_+^4$ .
- Extended Kac Moody symmetries induced by isometries of  $\delta M_+^4$  are also natural candidates for isometries. The motivation for the proposal comes from physical intuition deriving from string models. Note they do not include Poincare symmetries, which act naturally as isometries in the moduli space of causal diamonds (CDs) forming the "spine" of WCW.
- The light-like orbits of partonic 2-surfaces might allow separate symmetry algebras. One must however notice that there is exchange of charges between interior degrees of freedom and partonic 2-surfaces. The essential point is that one can assign to these surface conserved charges when the dual light-like coordinate defines time coordinate. This picture also assumes a slicing of space-time surface by the partonic orbits for which partonic orbits associated with wormhole throats and boundaries of the space-time surface would be special. This slicing would correspond to Hamilton-Jacobi structure.
- Fractal hierarchy of symmetry algebras with conformal weights, which are non-negative integer multiples of fundamental conformal weights, is essential and distinguishes TGD from string models. Gauge conditions are true only the isomorphic subalgebra and its commutator with the entire algebra and the maximal gauge symmetry to a dynamical symmetry with generators having conformal weights below maximal value. This view also conforms with p-adic mass calculations.
- The realization of the symmetries for 3-surfaces at the boundaries of CD and for light-like orbits of partonic 2-surfaces is known. The problem is how to extend the symmetries to the interior of the space-time surface. It is natural to expect that the symmetries at partonic orbits and light-cone boundary extend to the same symmetries.

After the developments towards the end of 2023, it seems that the extension of conformal and Kac-Moody symmetries of string models to the TGD framework is understood. What about symplectic symmetries, which were originally proposed as isometries of WCW? In this article this question is discussed in detail and it will be found that these symmetries act naturally on 3-D holographic data and one can identify conserved charges. By holography this is in principle enough and might imply that the actions of holomorphic and symplectic symmetry algebras are dual. Holography=holomorphy hypothesis is discussed also in the case of the modified Dirac equation.

### About the construction of scattering amplitudes

From the point of view of particle physics the ultimate goal is of course a practical construction recipe for the S-matrix of the theory. I have myself regarded this dream as quite too ambitious taking into account how far-reaching re-structuring and generalization of the basic mathematical structure of quantum physics is required. After having made several guesses for what the counterpart of S-matrix could be, it became clear that the dream about explicit formulas is unrealistic before one has understood what happens in quantum jump.

- In ZEO [K100, L28] one must distinguish between "small" state function reductions (SSFRs) and "big" SFRs (BSFRs). BSFR is the TGD counterpart of the ordinary SFRs and the arrow of the geometric time changes in it. SSFR follows the counterpart of a unitary time evolution and the arrow of the geometric time is preserved in SSFR. The sequence of SSFRs

is the TGD counterpart for the sequence of repeated quantum measurements of the same observables in which nothing happens to the state. In TGD something happens in SSFRs and this gives rise to the flow of consciousness. When the set of the observables measured in SSFR does not commute with the previous set of measured observables, BSFR occurs.

The evolution by SSFRs means that also the causal diamond changes. At quantum level one has a wave function in the finite-dimensional moduli space of CDs which can be said to form a spine of WCW [L66]. CDs form a scale hierarchy. SSFRs are preceded by a dispersion in the moduli space of CDs and SSFR means localization in this space.

- There are several S-matrix like entities. One can assign an analog of the S-matrix to each analog of unitary time evolution preceding a given SSFR. One can also assign an analog S-matrix between the eigenstate basis of the previous set of observables and the eigenstate basis of new observers: this S-matrix characterizes BSFR. One can also assign to zero energy states an S-matrix like entity between the states assignable to the two boundaries of CD. These S-matrix like objects can be interpreted as a complex square root of the density matrix representable as a diagonal and positive square root of density matrix and unitary S-matrix so that quantum theory in ZEO can be said to define a square root of thermodynamics at least formally.

In standard QFTs Feynman diagrams provide the description of scattering amplitudes. The beauty of Feynman diagrams is that they realize unitarity automatically via the so-called Cutkosky rules. In contrast to Feynman's original beliefs, Feynman diagrams and virtual particles are taken only as a convenient mathematical tool in quantum field theories. The QFT approach is however plagued by UV and IR divergences and one must keep mind open for the possibility that a genuine progress might mean opening of the black box of the virtual particle.

In the TGD framework this generalization of Feynman diagrams indeed emerges unavoidably.

- The counterparts of elementary particles can be identified as closed monopole flux tubes connecting two parallel Minkowskian space-time sheets and have effective ends which are Euclidean wormhole contacts. The 3-D light-like boundaries of wormhole contacts as orbits of partonic 2-surfaces.

The intuitive picture is that the 3-D light-like partonic orbits replace the lines of Feynman diagrams and vertices are replaced by 2-D partonic 2-surfaces. A stronger condition is that fermion number is carried by light-like fermion lines at the partonic orbits, which can be identified as boundaries string world sheets.

- The localization of the nodes of induced spinor fields to 2-D string world sheets (and possibly also to partonic 2-surfaces) implies a stringy formulation of the theory analogous to stringy variant of twistor formalism with string world sheets having interpretation as 2-braids. In the TGD framework, the fermionic variant of twistor Grassmann formalism combined with the number theoretic vision [L43, L44] led to a stringy variant of the twistor diagrammatics.
- Fundamental fermions are off-mass-shell in the sense that their momentum components are real algebraic integers in an extension of rationals associated with the space-time surfaces inside CD with a momentum unit determined by the CD size scale. Galois confinement states that the momentum components are integer valued for the physical states.
- The twistorial approach suggests also the generalization of the Yangian symmetry to infinite-dimensional super-conformal algebras, which would determine the vertices and scattering amplitudes in terms of poly-local symmetries.

The twistorial approach is however extremely abstract and lacks a concrete physical interpretation. The holography=holomorphy vision led to a breakthrough in the construction of the scattering amplitudes by solving the problem of identifying interaction vertices [L78].

1. The basic prediction is that space-time surfaces as analogs of Bohr orbits are holomorphic in a generalized sense and are therefore minimal surfaces. The minimal surface property fails at lower-dimensional singularities and the trace of the second fundamental form (SFF) analogous to acceleration associated with the Bohr orbit of the particle as 3-surface has a delta function like singularity but vanishes elsewhere.

2. The minimal surface property expresses masslessness for both fields and particles as 3-surfaces. At singularities masslessness property fails and singularities can be said to serve as sources which also in QFT define scattering amplitudes.
3. The singularities are analogs of poles and cuts for the 4-D generalization of the ordinary holomorphic functions. Also for the ordinary holomorphic functions the Laplace equation as analog massless field equation and expressing analyticity fails. Complex analysis generalizes to dimension 4.
4. The conditions at the singularity give a generalization of Newton's "F=ma"! I ended up where I started more than 50 years ago!
5. In dimension 4, and only there, there is an infinite number of exotic diff structures [?], which differ from ordinary ones at singularities of measure zero analogous to defects. These defects correspond naturally to the singularities of minimal surfaces. One can say that for the exotic diff structure there is no singularity.
6. Group theoretically the trace of the SFF can be regarded as a generalization of the Higgs field, which is non-vanishing only at the vertices and this is enough. Singularities take the role of generalized particle vertices and determine the scattering amplitudes. The second fundamental form contracted with the embedding space gamma matrices and slashed between the second quantized induced spinor field and its conjugate gives the universal vertex involving only fermions (bosons are bound states of fermions in TGD). It contains both gauge and gravitational contributions to the scattering amplitudes and there is a complete symmetry between gravitational and gauge interactions. Gravitational couplings come out correctly as the radius squared of  $CP_2$  as also in the classical picture.
7. The study of the modified Dirac equation leads to the conclusion that vertices as singularities and defects contain the standard electroweak gauge contribution coming from the induced spinor connection and a contribution from the  $M^4$  spinor connection.  $M^4$  part of the generalized Higgs can give rise to a graviton as an  $L = 1$  rotational state of the flux tube representing the graviton. It is not clear whether  $M^4$  Kähler gauge potential can give rise to a spin 1 particle. The vielbein part of  $M^4$  spinor connection is pure gauge and could give rise to gravitational topological field theory.

## Figures

### Basic ideas of TGD inspired quantum biology

The following list gives the basic elements of TGD inspired quantum biology.

- Many-sheeted space-time allows the interpretation of the structures of macroscopic world around us in terms of space-time topology. Magnetic/body acts as intentional agent using biological body as a sensory receptor and motor instrument and controlling biological body and inheriting its hierarchical fractal structure. Fractal hierarchy of EEGs and its variants can be seen as communication and control tools of magnetic body. Also collective levels of consciousness have a natural interpretation in terms of magnetic body. Magnetic body makes also possible entanglement in macroscopic length scales. The braiding of magnetic flux tubes makes possible topological quantum computations and provides a universal mechanism of memory. One can also understand the real function of various information molecules and corresponding receptors by interpreting the receptors as addresses in quantum computer memory and information molecules as ends of flux tubes which attach to these receptors to form a connection in quantum web.

Note that also the notion of electric body makes sense [L56]. Quite generally, long range classical gravitational, electric and magnetic fields give rise to very large values of effective Planck constants. The Nottale's hypothesis of gravitational Planck constant generalizes to electric interactions.

Figure 1: The problems leading to TGD as their solution.

- Magnetic body carrying dark matter and forming an onion-like structure with layers characterized by large values of Planck constant is the key concept of TGD inspired view about Quantum Mind to biology.. Magnetic body is identified as intentional agent using biological body as sensory receptor and motor instrument. EEG and its fractal variants are identified as a communication and control tool of the magnetic body and a fractal hierarchy of analogs of EEG is predicted. Living system is identified as a kind of Indra's net with biomolecules representing the nodes of the net and magnetic flux tubes connections between them.

The reconnection of magnetic flux tubes and phase transitions changing Planck constant and therefore the lengths of the magnetic flux tubes are identified as basic mechanisms behind DNA replication and analogous processes and also behind the phase transitions associated with the gel phase in cell interior. The braiding of magnetic flux makes possible universal memory representation recording the motions of the basic units connected by flux tubes. Braiding also defines topological quantum computer programs updated continually by the flows of the basic units. The model of DNA as topological quantum computer is discussed as an application. In zero energy ontology the braiding actually generalize to 2-braiding for string world sheets in 4-D space-time and brings in new elements.

- Zero energy ontology (ZEO) makes possible the proposed p-adic description of intentions and cognitions and their transformations to action. Time mirror mechanism based on sending of negative energy signal to geometric past would apply to both long term memory recall, remote metabolism, and realization of intentional acting as an activity beginning in the geometric past in accordance with the findings of Libet. ZEO gives a precise content to the notion of negative energy signal in terms of zero energy state for which the arrow of geometric time is opposite to the standard one.

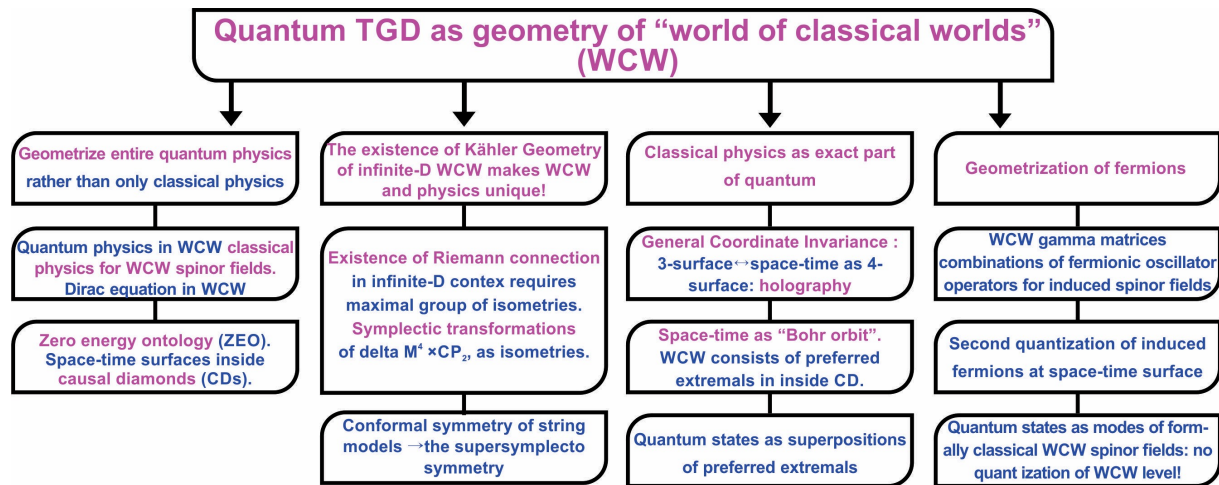

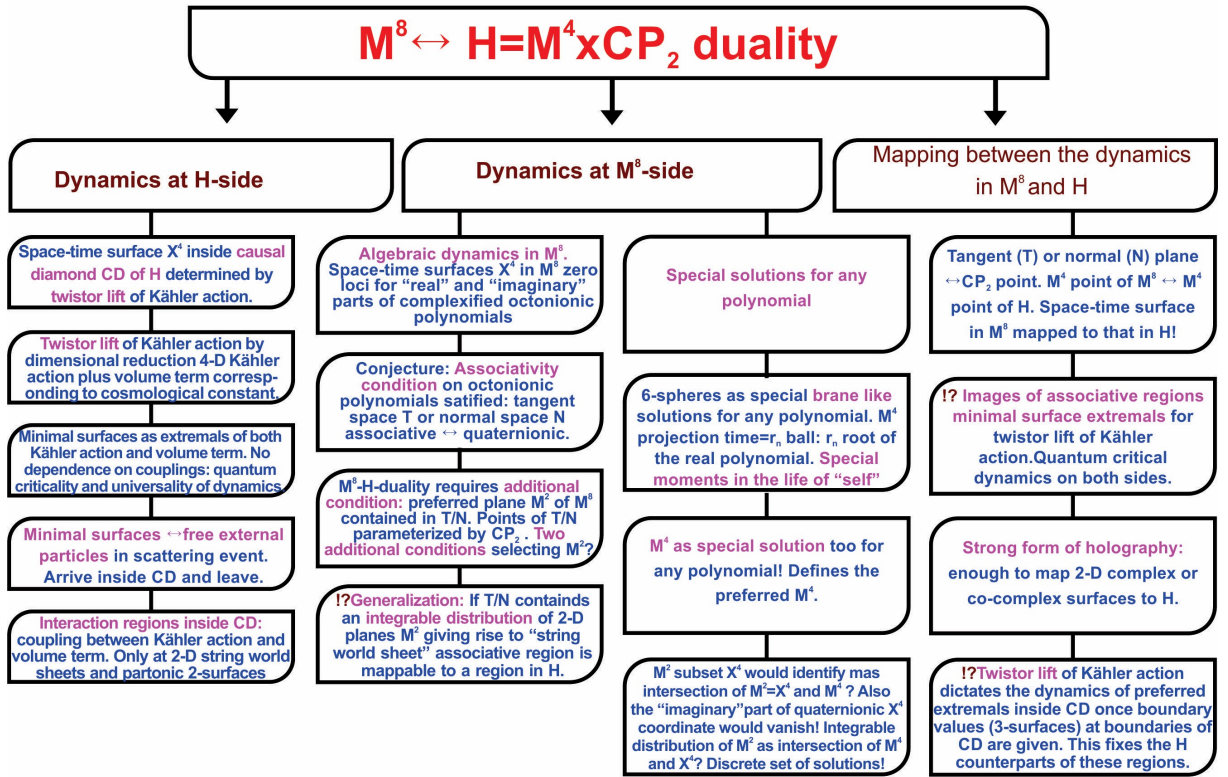

Figure 2: Twistor lift

**Figure 3:** Geometrization of quantum physics in terms of WCW

The associated notion of causal diamond ( $CD$ ) is essential element and assigns to elementary particles new fundamental time scales which are macroscopic: for electron the time scale is .1 seconds, the fundamental biorhythm. An essentially new element is time-like entanglement which allows to understand among other things the quantum counterparts of Boolean functions in terms of time-like entanglement in fermionic degrees of freedom.

- The assignment of dark matter with a hierarchy of Planck constants gives rise to a hierarchy of macroscopic quantum phases making possible macroscopic and macrotemporal quantum coherence and allowing to understand evolution as a gradual increase of Planck constant. The model for dark nucleons leads to a surprising conclusion: the states of nucleons correspond to DNA, RNA, tRNA, and amino-acids in a natural manner and vertebrate genetic code as correspondence between DNA and amino-acids emerges naturally. This suggests that genetic code is realized at the level of dark hadron physics and living matter in the usual sense provides a secondary representation for it. The hierarchy of Planck constants emerges from basic TGD under rather general assumptions.
- p-Adic physics can be identified as physics of cognition and intentionality. Negentropic entanglement possible for number theoretic entanglement entropy makes sense for rational (and even algebraic) entanglement and leads to the identification of life as something residing in the intersection of real and p-adic worlds. NMP respects negentropic entanglement and the attractive idea is that the experience of understanding and positively colored emotions relate to negentropic entanglement.
- Living matter as conscious hologram is one of the basic ideas of TGD inspired biology and consciousness theory. The basic objection against TGD is that the interference of classical

Figure 4:  $M^8 - H$  duality

fields is impossible in the standard sense for the reason that that classical fields are not primary dynamical variables in TGD Universe. The resolution is based on the observation that only the interference of the effects caused by these fields can be observed experimentally and that many-sheeted space-time allows to realized the summation of effects in terms of multiple topological condensations of particles to several parallel space-time sheets. One concrete implication is fractality of qualia. Qualia appear in very wide range of scales: our qualia could in fact be those of magnetic body. The proposed mechanism for the generation of qualia realizes the fractality idea.

Various anomalies of living matter have been in vital role in the development of not only TGD view about living matter but also TGD itself.

- TGD approach to living matter was strongly motivated by the findings about the strange behavior of cell membrane and of cellular water, and gel behavior of cytoplasm. Also the findings about effects of ELF em fields on vertebrate brain were decisive and led to the proposal of the hierarchy of Planck constants found later to emerge naturally from the non-determinism of Kähler action. Rather satisfactorily, the other manner to introduce the hierarchy of Planck constants is in terms of gravitational Planck constant: at least in microscopic scales the equivalence of these approaches makes sense and leads to highly non-trivial predictions. The basic testable prediction is that dark photons have cyclotron frequencies inversely proportional to their masses but universal energy spectrum in visible and UV range which corresponds to the transition energies for biomolecules so that they are ideal for biocontrol at the level of both magnetic bodies and at the level of biochemistry.
- Water is in key role in living matter and also in TGD inspired view about living matter. The

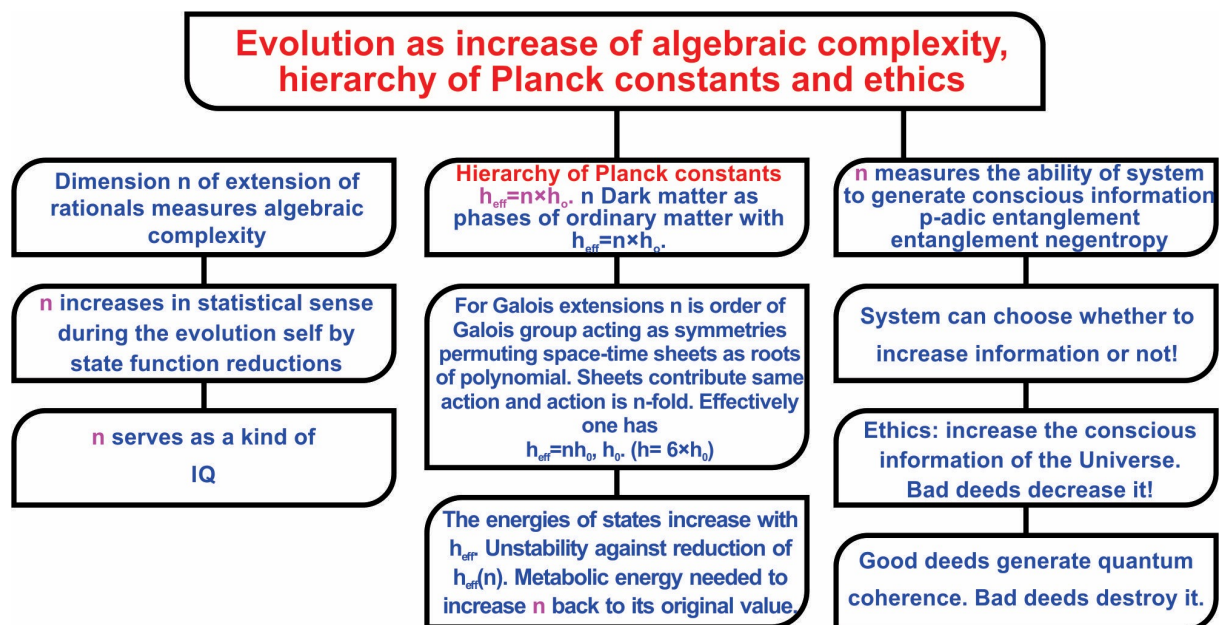

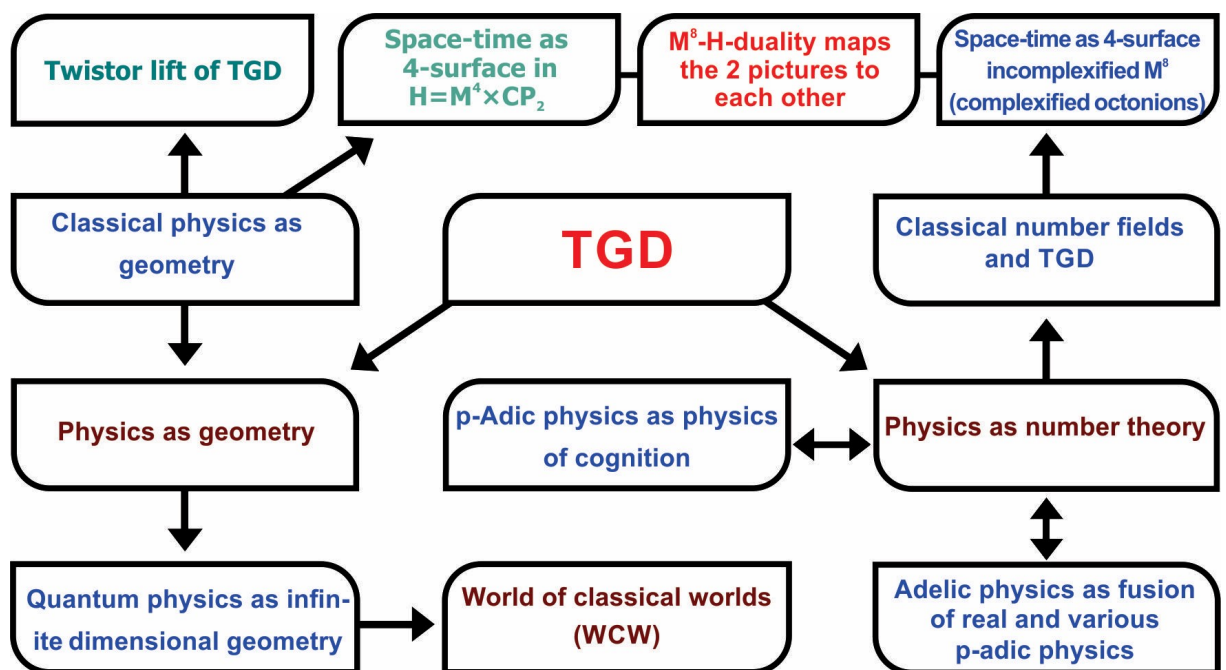

Figure 5: Number theoretic view of evolution

**Figure 6:** TGD is based on two complementary visions: physics as geometry and physics as number theory.

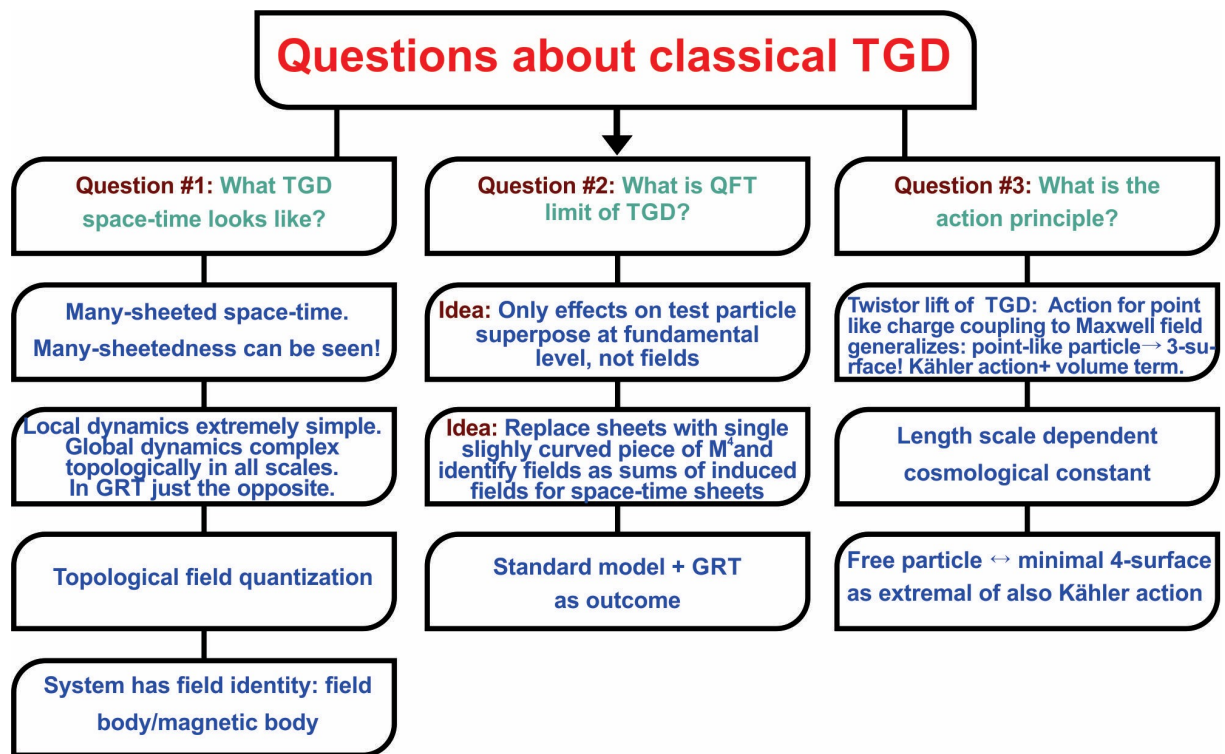

Figure 7: Questions about classical TGD.

**Figure 8:** p-Adic physics as physics of cognition and imagination.

anomalies of water lead to a model for dark nuclei as dark proton strings with the surprising prediction that DNA, RNA, amino acids and even tRNA are in one-one correspondence with the resulting 3-quark states and that vertebrate genetic code emerges naturally. This leads to a vision about water as primordial lifeform still playing a vital role in living organisms. The model of water memory and homeopathy in turn generalizes to a vision about how immune system might have evolved.

- Metabolic energy is necessary for conscious information processing in living matter. This suggests that metabolism should be basically transfer of negentropic entanglement from nutrients to the organism. ATP could be seen as a molecule of consciousness in this picture and high energy phosphate bond would make possible the transfer of negentropy.
- Pollack effect and its generalizations are in a central role in the TGD inspired quantum biology. In the Pollack effect, the feed of energy allows to increase the value of effective Planck constant so that an ordinary charged particle transforms to its dark variant, being kicked to, say, the gravitational magnetic body of the system itself or some other system such as the Earth or Sun. Charge separation takes place between ordinary biomatter and its magnetic body. Dissipation is extremely small at the magnetic /field body so that Pollack effect makes it possible to realize various biological functions at the magnetic/field body. Photons, in particular solar photons, can provide the energy needed to increase the value of  $h_{eff}$  but there are many other possibilities. For instance, the formation of molecular bound states of atoms liberates energy which can be used in the Pollack effect and this process could generate dark matter at the magnetic and more general field bodies.

**CAUSAL DIAMOND (CD)**

**Figure 9:** Causal diamond

Figure 10: CDs define a fractal “conscious atlas”

Figure 11: Time reversal occurs in BSFR

## Figures

Figure 12: The problems leading to TGD as their solution.

## TGD view of consciousness very briefly

The following is a very brief summary of the basic notions and ideas of TGD inspired theory of consciousness.

- TGD inspired theory of consciousness can be seen as a generalization of quantum measurement theory by bringing in the conscious observer. One can even say that Quantum TGD is basically a theory of conscious experience.

The basic new elements are the resolution of the basic problem of the measurement theory by the introduction of ZEO, which brings new elements also to the quantum measurement theory and leads to a view about how the arrow of time and its flow are generated. Number theoretic physics brings in p-adic physics and the notion of negentropic entanglement. Negentropy Maximization Principle (NMP) was first proposed to serve as a variational principle of consciousness but turned out to follow from number theoretical evolution as a mathematical analog of the second law and implying it. The possibility of negentropic entanglement indeed predicts evolution as gradual increase of negentropic resources of the Universe.

- There are two kinds of state function reductions: the "small" ones (SSFRs) and the "big" ones (BSFRs). The sequence of SSFRs is the counterpart for the repeated measurements of the same observables or at least for a sequence involving measurements of sets of mutually commuting observables such that these sets commute with each other. The state function

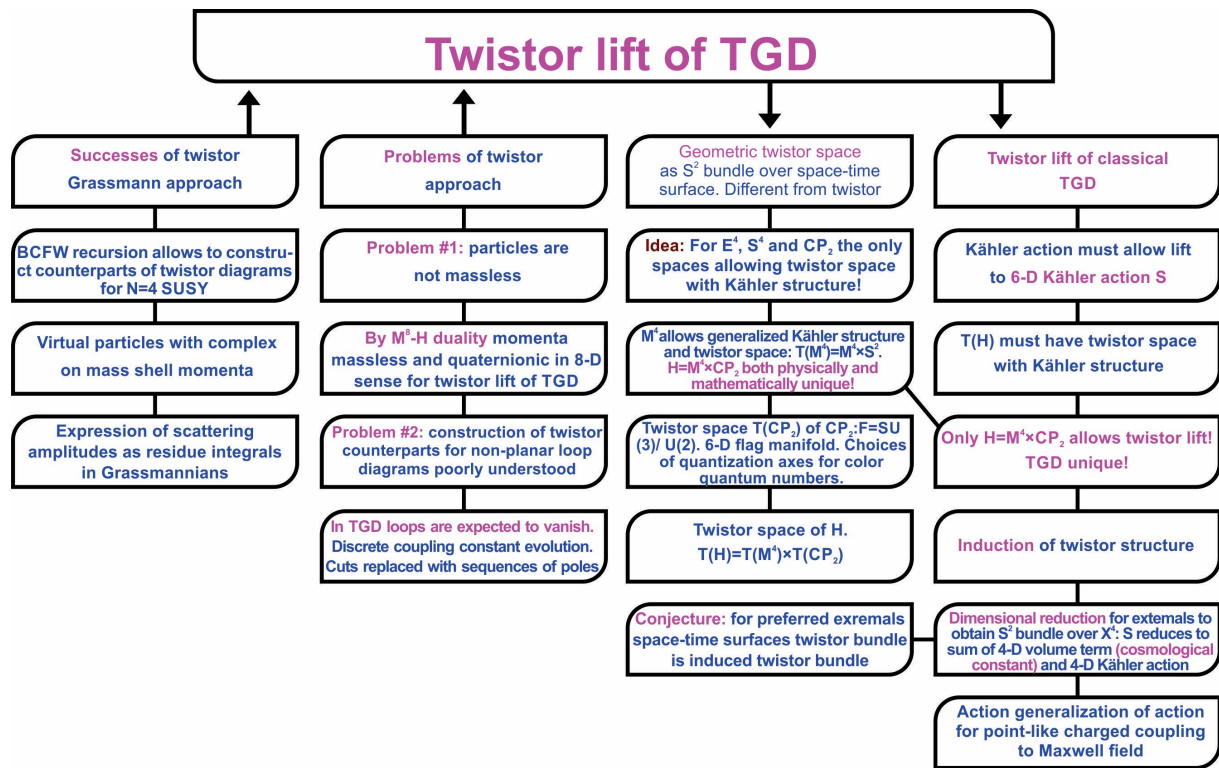

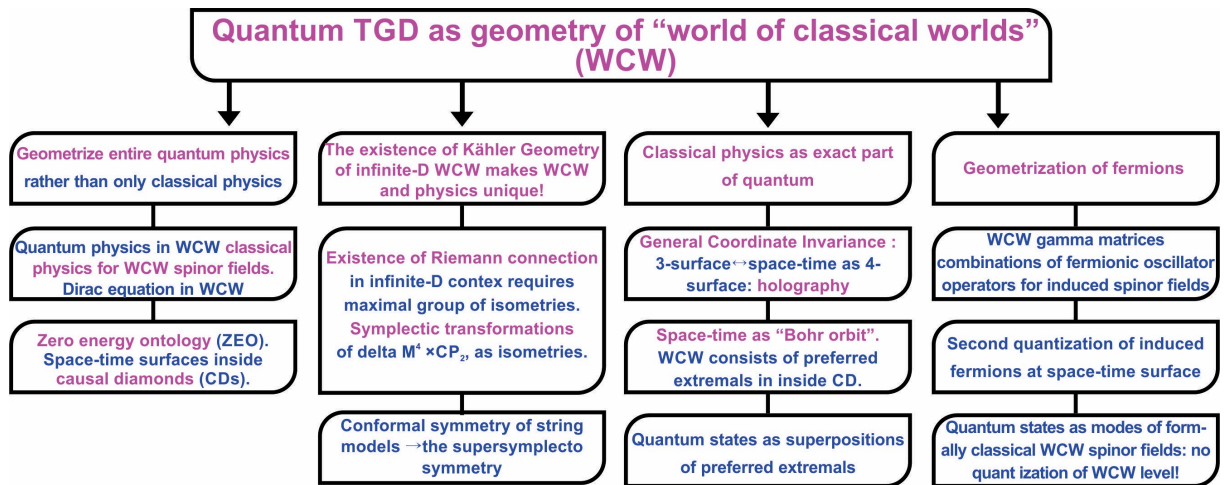

Figure 13: Twistor lift

**Figure 14:** Geometrization of quantum physics in terms of WCW

reductions which leave invariant only the second part of the zero energy state but change the other one: this is the counterpart of the Zeno effect.

Self can be identified as the sequence of SSFRs preceded by the TGD counterparts of unitary time evolutions. The generation of “Akashic records” defined by negentropically entangled systems plays a vital role in the understanding of evolution.

When the set of observables measured in does not commute with the preceding set, SSFR is not possible and BSFR occurs and changes the arrow of time. The roles of the boundaries of CD are changed. Self reincarnates with an opposite arrow of time. Since the classical signals generated by self propagate to opposite time direction, “classical” memories about this period are not possible.

This prediction is something totally new and profoundly affects the view of physics even in cosmological scales since the hierarchy of effective Planck constants allows quantum coherence and consciousness are therefore possible in all scales. For the outsider BSFR looks like a loss of consciousness, death, or falling asleep. The system starts to live consciously in the opposite time direction and reincarnates in the next BSFR.

The strongest simplifying assumption is that the size of CD increases steadily in the sequences of SSFRs. A more precise view is achieved by introducing the finite-dimensional space of CDs. A given SSFR is preceded by a TGD counterpart of a unitary time evolution as a dispersion in the space of CDs. SSFR means a localization in this moduli space and implies the statistical increase of the size CD and the correlation between experienced time as sequence of SSFRs with the geometric time identifiable as the distance between the tips of CD.

- CDs serve as correlates of selves and a hierarchy of selves is predicted and closely relates to

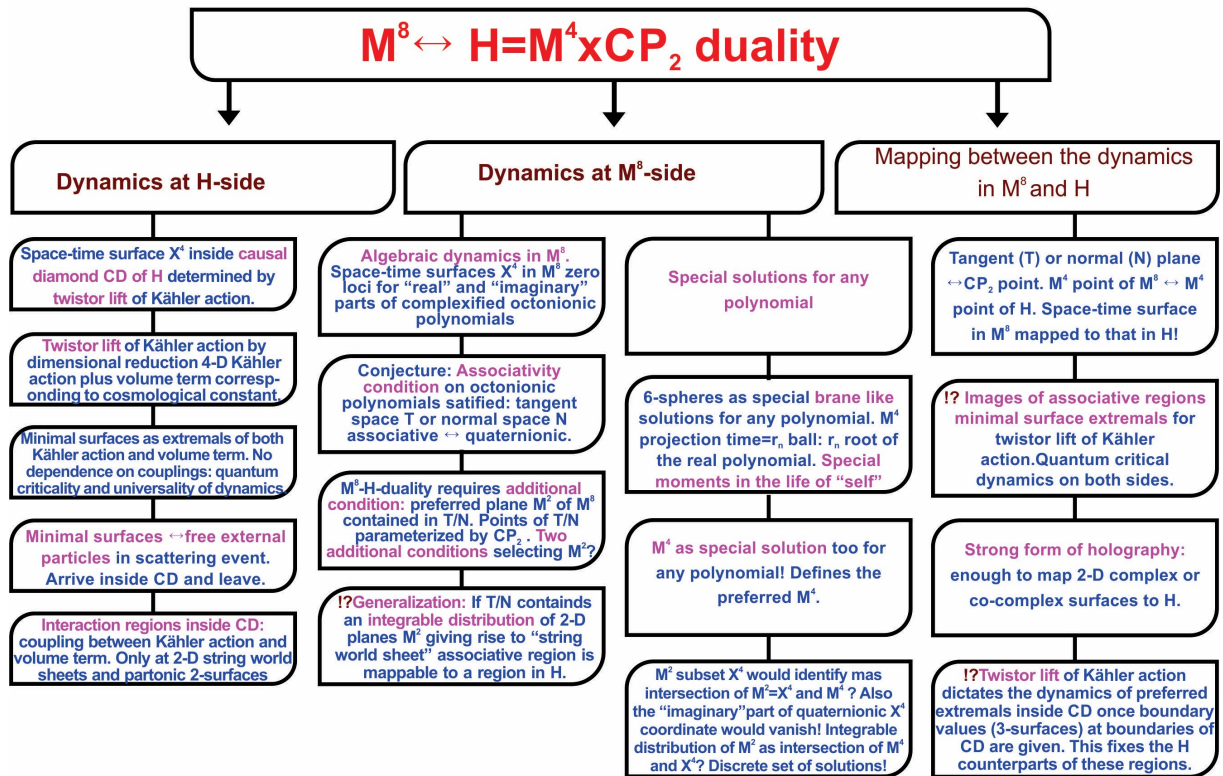

Figure 15:  $M^8 - H$  duality

the p-adic hierarchy and hierarchy of Planck constants. Subselves are interpreted as mental images of self and the sharing of mental images by fusion of subselves gives rise to a kind of stereo consciousness.

### Figures

What I have said above is strongly biased view about the recent situation in quantum TGD. This vision is single man's view and doomed to contain unrealistic elements as I know from experience. My dream is that young critical readers could take this vision seriously enough to try to demonstrate that some of its basic premises are wrong or to develop an alternative based on these or better premises. I must be however honest and tell that 45 years of TGD is a really vast bundle of thoughts and quite a challenge for anyone who is not able to cheat himself by taking the attitude of a blind believer or a light-hearted debunker trusting on the power of easy rhetoric tricks.

# ACKNOWLEDGEMENTS

Neither TGD nor these books would exist without the help and encouragement of many people. The friendship with Heikki and Raija Haila and their family and Kalevi and Ritva Tikkanen and their family have been kept me in contact with the everyday world and without this friendship I would not have survived through these lonely 45 lonely years most of which I have remained unemployed as a scientific dissident. I am happy that my children have understood my difficult position and like my friends have believed that what I am doing is something valuable although I have not received any official recognition for it.

During the last decade Tapio Tammi has helped me quite concretely by providing the necessary computer facilities and being one of the few persons in Finland with whom to discuss my work. Pertti Kärkkäinen is my old physicist friend and has provided continued economic support for a long time. I have also had stimulating discussions with Samuli Penttinen who has also helped to get through the economical situations in which there seemed to be no hope. The continual updating of fifteen online books means quite a heavy bureaucracy at the level of bits and without a systemization one ends up with endless copying and pasting and internal consistency is soon lost. Tommi Ullgren has provided both economic support and encouragement during years. Pekka Rapinoja has offered his help in this respect and I am especially grateful to him for my Python skills.

During the last five years I have had inspiring discussions with many people in Finland interested in TGD. We have had video discussions with Sini Kunnas and had podcast discussions with Marko Manninen related to the TGD based view of physics and consciousness. Marko has also helped in the practical issues related to computers and quite recently he has done a lot of testing of chatGPT helping me to get an overall view of what it is. The discussions in a Zoom group involving Marko Manninen, Tuomas Sorakivi and Rode Majakka have given me the valuable opportunity to clarify my thoughts.

The collaboration with Lian Sidorov was extremely fruitful and she also helped me to survive economically through the hardest years. The participation in CASYS conferences in Liege has been an important window to the academic world and I am grateful for Daniel Dubois and Peter Marcer for making this participation possible. The discussions and collaboration with Eduardo de Luna and Istvan Dienes stimulated the hope that the communication of new vision might not be a mission impossible after all. Also blog discussions have been very useful. During these years I have received innumerable email contacts from people around the world. I am grateful to Mark McWilliams, Paul Kirsch, Gary Ehlenberg, and Ulla Matfolk and many others for providing links to possibly interesting websites and articles. We have collaborated with Peter Gariaev and Reza Rastmanesh. These contacts have helped me to avoid the depressive feeling of being some kind of Don Quixote of Science and helped me to widen my views: I am grateful for all these people.

In the situation in which the conventional scientific communication channels are strictly closed it is important to have some loop hole through which the information about the work done can at least in principle leak to the public through the iron wall of academic censorship. Without any exaggeration I can say that without the world wide web I would not have survived as a scientist nor as an individual. Homepage and blog are however not enough since only the formally published result is a result in recent day science. Publishing is however impossible without direct support from power holders- even in archives like arXiv.org.

Situation changed as Andrew Adamatsky proposed the writing of a book about TGD when I had already gotten used to the thought that my work would not be published during my lifetime. The Prespacetime Journal and two other journals related to quantum biology and consciousness - all of them founded by Huping Hu - have provided this kind of loophole. In particular, Dainis Zeps,

Phil Gibbs, and Arkadiusz Jadczyk deserve my gratitude for their kind help in the preparation of an article series about TGD catalyzing a considerable progress in the understanding of quantum TGD. Also the viXra archive founded by Phil Gibbs and its predecessor Archive Freedom have been of great help: Victor Christianto deserves special thanks for doing the hard work needed to run Archive Freedom. Also the Neuroquantology Journal founded by Sultan Tarlaci deserves a special mention for its publication policy.

And last but not least: there are people who experience as a fascinating intellectual challenge to spoil the practical working conditions of a person working with something which might be called unified theory: I am grateful for the people who have helped me to survive through the virus attacks, an activity which has taken roughly one month per year during the last half decade and given a strong hue of grey to my hair.

For a person approaching his 73th birthday it is somewhat easier to overcome the hard feelings due to the loss of academic human rights than for an inpatient youngster. Unfortunately the economic situation has become increasingly difficult during the twenty years after the economic depression in Finland which in practice meant that Finland ceased to be a constitutional state in the strong sense of the word. It became possible to depose people like me from society without fear about public reactions and the classification as dropout became a convenient tool of ridicule to circumvent the ethical issues. During the period when the right wing held political power this trend was steadily strengthening and the situation is the same as I am writing this. In this kind of situation the concrete help from individuals has been and will be of utmost importance. Against this background it becomes obvious that this kind of work is not possible without the support from outside and I apologize for not being able to mention all the people who have helped me during these years.

# Chapter 1

## Introduction

### 1.1 Basic Ideas of Topological Geometroynamics (TGD)

Standard model describes rather successfully both electroweak and strong interactions but sees them as totally separate and contains a large number of parameters which it is not able to predict. For about four decades ago unified theories known as Grand Unified Theories (GUTs) trying to understand electroweak interactions and strong interactions as aspects of the same fundamental gauge interaction assignable to a larger symmetry group emerged. Later superstring models trying to unify even gravitation and strong and weak interactions emerged. The shortcomings of both GUTs and superstring models are now well-known. If TGD - whose basic idea emerged towards the end of 1977 - would emerge now it would be seen as an attempt to solve the difficulties of these approaches to unification.

The basic physical picture behind the geometric vision of TGD corresponds to a fusion of two rather disparate approaches: namely TGD as a Poincare invariant theory of gravitation and TGD as a generalization of the old-fashioned string model. After 1995 number theoretic vision started to develop and was initiated by the success of mass calculations based on p-adic thermodynamics. Number theoretic vision involves all number fields and is complementary to the geometric vision: one can say that this duality is analogous to momentum-position duality of wave mechanics. TGD can be also regarded as topological quantum theory in a very general sense as already the attribute "Topological" in "TGD" makes clear. Space-time surfaces as minimal surfaces can be regarded as representatives of homology equivalence classes and p-adic topologies generalize the notion of local topology and apply to the description of correlates of cognition.

#### 1.1.1 Geometric Vision Very Briefly

*T(opological) G(eometro)D(ynamics)* is one of the many attempts to find a unified description of basic interactions. The development of the basic ideas of TGD to a relatively stable form took time of about half decade [K1].

The basic vision and its relationship to existing theories is now rather well understood.

1. Space-times are representable as 4-surfaces in the 8-dimensional embedding space  $H = M^4 \times CP_2$ , where  $M^4$  is 4-dimensional (4-D) Minkowski space and  $CP_2$  is 4-D complex projective space (see Appendix).
2. Induction procedure (a standard procedure in fiber bundle theory, see Appendix) allows to geometrize various fields. Space-time metric characterizing gravitational fields corresponds to the induced metric obtained by projecting the metric tensor of  $H$  to the space-time surface. Electroweak gauge potentials are identified as projections of the components of  $CP_2$  spinor connection to the space-time surface, and color gauge potentials as projections of  $CP_2$  Killing vector fields representing color symmetries. Also spinor structure can be induced: induced spinor gamma matrices are projections of gamma matrices of  $H$  and induced spinor fields just  $H$  spinor fields restricted to space-time surface. Spinor connection is also projected. The interpretation is that distances are measured in embedding space metric and parallel translation using spinor connection of embedding space.

Twistor lift of TGD means that one can lift space-time surfaces in  $H$  to 6-D surfaces a analogs of twistor space of space-time surface in the Cartesian product of the twistor spaces of  $M^4$  and  $CP_2$ , which are the only 4-manifolds allowing twistor space with Kähler structure [A12]. The twistor structure would be induced in some sense, and should coincide with that associated with the induced metric. Clearly, the 2-spheres defining the fibers of twistor spaces of  $M^4$  and  $CP_2$  must allow identification: this 2-sphere defines the  $S^2$  fiber of the twistor space of the space-time surface. This poses a constraint on the embedding of the twistor space of space-time surfaces as sub-manifold in the Cartesian product of twistor spaces. The existence of Kähler structure allows to lift 4-D Kähler action to its 6-D counterparts and the 6-D counterpart of twistor space is obtained by its dimensional reduction so that one obtains a sphere bundle. This makes possible twistorialization for all space-time surfaces: in general relativity the general metric does not allow this.

3. A geometrization of quantum numbers is achieved. The isometry group of the geometry of  $CP_2$  codes for the color gauge symmetries of strong interactions. Vierbein group codes for electroweak symmetries, and explains their breaking in terms of  $CP_2$  geometry so that standard model gauge group results. There are also important deviations from the standard model: color quantum numbers are not spin-like but analogous to orbital angular momentum: this difference is expected to be seen only in  $CP_2$  scale. In contrast to GUTs, quark and lepton numbers are separately conserved and family replication has a topological explanation in terms of topology of the partonic 2-surface carrying fermionic quantum numbers.

$M^4$  and  $CP_2$  are unique choices for many other reasons. For instance, they are the unique 4-D space-times allowing twistor space with Kähler structure.  $M^4$  light-cone boundary allows a huge extension of 2-D conformal symmetries.  $M^4$  and  $CP_2$  allow quaternionic structures. Therefore standard model symmetries have number theoretic meaning.

4. Induced gauge potentials are expressible in terms of embedding space coordinates and their gradients and general coordinate invariance implies that there are only 4 field-like variables locally. Situation is thus extremely simple mathematically. The objection is that one loses linear superposition of fields. The resolution of the problem comes from the generalization of the concepts of particle and space-time.

Space-time surfaces can be also particle like having thus finite size. In particular, space-time regions with Euclidian signature of the induced metric (temporal and spatial dimensions in the same role) emerge and have interpretation as lines of generalized Feynman diagrams. Particles in space-time can be identified as a topological inhomogeneities in background space-time surface which looks like the space-time of general relativity in long length scales.

One ends up with a generalization of space-time surface to many-sheeted space-time with space-time sheets having extremely small distances of about  $10^4$  Planck lengths ( $CP_2$  size). As one adds a particle to this kind of structure, it touches various space-time sheets and thus interacts with the associated classical fields. Their effects superpose linearly in good approximation and linear superposition of fields is replaced with that for their effects.

This resolves the basic objection. It also leads to the understanding of how the space-time of general relativity and quantum field theories emerges from TGD space-time as effective space-time when the sheets of many-sheeted space-time are lumped together to form a region of Minkowski space with metric replaced with a metric identified as the sum of empty Minkowski metric and deviations of the metrics of sheets from empty Minkowski metric. Gauge potentials are identified as sums of the induced gauge potentials. TGD is therefore a microscopic theory from which the standard model and general relativity follow as a topological simplification, however forcing a dramatic increase of the number of fundamental field variables.

5. A further objection is that classical weak fields identified as induced gauge fields are long ranged and should cause large parity breaking effects due to weak interactions. These effects are indeed observed but only in living matter. The basic problem is that one has long ranged classical electroweak gauge fields. The resolution of the problem is that the quantum averages of induced weak and color gauge fields vanish due to the fact that color rotations affect both space-time surfaces and induced weak and color fields. Only the averages of

electromagnetic fields are nonvanishing. The correlations functions for weak fields are nonvanishing below Compton lengths of weak bosons. In living matter large values of effective Planck constant labelling phases of ordinary matter identified as dark matter make possible long ranged weak fields and color fields.

6. General coordinate invariance requires holography so that space-time surfaces are analogous to Bohr orbits for particles identified as 3-surfaces. Bohr orbit property would be naturally realized by a 4-D generalization of holomorphy of string world sheets and implies that the space-time surfaces are minimal surfaces apart from singularities. This holds true for any action as long as it is general coordinate invariant and constructible in terms of the induced geometry. String world sheets and light-like orbits of partonic 2-surfaces correspond to singularities at which the minimal surface property of the space-time surfaces realizing the preferred extremal property fails. Preferred extremals are not completely deterministic, which implies what I call zero energy ontology (ZEO) meaning that the Bohr orbits are the fundamental objects. This leads to a solution of the basic paradox of quantum measurement theory. Also the mathematically ill-defined path integral disappears and leaves only the well-defined functional integral over the Bohr orbits.
7. A string model-like picture emerges from TGD and one ends up with a rather concrete view about the topological counterpart of Feynman diagrammatics. The natural stringy action would be given by the string world sheet area, which is present only in the space-time regions with Minkowskian signature. Gravitational constant could be present as a fundamental constant in string action and the ratio  $\hbar/G/R^2$  would be determined by quantum criticality conditions. The hierarchy of Planck constants  $\hbar_{eff}/\hbar = n$  assigned to dark matter in TGD framework would allow to circumvent the objection that only objects of length of order Planck length are possible since string tension given by  $T = 1/\hbar_{eff}G$  apart from numerical factor could be arbitrary small. This would make possible gravitational bound states as partonic 2-surfaces as structures connected by strings and solve the basic problem of superstring theories. This option allows the natural interpretation of  $M^4$  type vacuum extremals with  $CP_2$  projection, which is Lagrange manifold as good approximations for space-time sheets at macroscopic length scales. String area does not contribute to the Kähler function at all.

Whether induced spinor fields associated with Kähler-Dirac action and de-localized inside the entire space-time surface should be allowed remains an open question: super-conformal symmetry strongly suggests their presence. A possible interpretation for the corresponding spinor modes could be in terms of dark matter, sparticles, and hierarchy of Planck constants.

It is perhaps useful to make clear what TGD is not and also what new TGD can give to physics.

1. TGD is *not* just General Relativity made concrete by using embeddings: the 4-surface property is absolutely essential for unifying standard model physics with gravitation and to circumvent the incurable conceptual problems of General Relativity. The many-sheeted space-time of TGD gives rise only at the macroscopic limit to GRT space-time as a slightly curved Minkowski space. TGD is *not* a Kaluza-Klein theory although color gauge potentials are analogous to gauge potentials in these theories.

TGD space-time is 4-D and its dimension is due to completely unique conformal properties of light-cone boundary and 3-D light-like surfaces implying enormous extension of the ordinary conformal symmetries. Light-like 3-surfaces represent orbits of partonic 2-surfaces and carry fundamental fermions at 1-D boundaries of string world sheets. TGD is *not* obtained by performing Poincare gauging of space-time to introduce gravitation and is plagued by profound conceptual problems.

2. TGD is *not* a particular string model although string world sheets emerge in TGD very naturally as loci for spinor modes: their 2-dimensionality makes among other things possible quantum deformation of quantization known to be physically realized in condensed matter, and conjectured in TGD framework to be crucial for understanding the notion of finite measurement resolution. Hierarchy of objects of dimension up to 4 emerge from TGD: this obviously means analogy with branes of super-string models.

TGD is *not* one more item in the collection of string models of quantum gravitation relying on Planck length mystics. Dark matter becomes an essential element of quantum gravitation and quantum coherence in astrophysical scales is predicted just from the assumption that strings connecting partonic 2-surfaces are responsible for gravitational bound states.

TGD is *not* a particular string model although AdS/CFT duality of super-string models generalizes due to the huge extension of conformal symmetries and by the identification of WCW gamma matrices as Noether super-charges of super-symplectic algebra having a natural conformal structure.

3. TGD is *not* a gauge theory. In TGD framework the counterparts of also ordinary gauge symmetries are assigned to super-symplectic algebra (and its Yangian [A2] [B6, B4, B5]), which is a generalization of Kac-Moody algebras rather than gauge algebra and suffers a fractal hierarchy of symmetry breakings defining hierarchy of criticalities. TGD is *not* one more quantum field theory like structure based on path integral formalism: path integral is replaced with functional integral over 3-surfaces, and the notion of classical space-time becomes an exact part of the theory. Quantum theory becomes formally a purely classical theory of WCW spinor fields: only state function reduction is something genuinely quantal.
4. TGD view about spinor fields is *not* the standard one. Spinor fields appear at three levels. Spinor modes of the embedding space are analogs of spinor modes characterizing incoming and outgoing states in quantum field theories. Induced second quantized spinor fields at space-time level are analogs of stringy spinor fields. Their modes are localized by the well-definedness of electro-magnetic charge and by number theoretic arguments at string world sheets. Kähler-Dirac action is fixed by supersymmetry implying that ordinary gamma matrices are replaced by what I call Kähler-Dirac gamma matrices - this something new. WCW spinor fields, which are classical in the sense that they are not second quantized, serve as analogs of fields of string field theory and imply a geometrization of quantum theory.
5. TGD is in some sense an extremely conservative geometrization of entire quantum physics: *no* additional structures such as gauge fields as independent dynamical degrees of freedom are introduced: Kähler geometry and associated spinor structure are enough. “Topological” in TGD should not be understood as an attempt to reduce physics to torsion (see for instance [B3]) or something similar. Rather, TGD space-time is topologically non-trivial in all scales and even the visible structures of the everyday world represent non-trivial topology of space-time in the TGD Universe.
6. Twistor space - or rather, a generalization of twistor approach replacing masslessness in 4-D sense with masslessness in 8-D sense and thus allowing description of also massive particles - emerged originally as a technical tool, and its Kähler structure is possible only for  $H = M^4 \times CP_2$ . It however turned out that much more than a technical tool is in question. What is genuinely new is the infinite-dimensional character of the Kähler geometry making it highly unique, and its generalization to p-adic number fields to describe correlates of cognition. Also the hierarchy of Planck constants  $h_{eff} = n \times h$  reduces to the quantum criticality of the TGD Universe and p-adic length scales and Zero Energy Ontology represent something genuinely new.

The great challenge is to construct a mathematical theory around these physically very attractive ideas and I have devoted the last 45 years to the realization of this dream and this has resulted in 26 online books about TGD and nine online books about TGD inspired theory of consciousness and of quantum biology.

A collection of 30 online books is now (August 2023) under preparation. The goal is to minimize overlap between the topics of the books and make the focus of a given book sharper.

### 1.1.2 Two Visions About TGD as Geometrization of Physics and Their Fusion

As already mentioned, TGD as a geometrization of physics can be interpreted both as a modification of general relativity and generalization of string models.

### TGD as a Poincare Invariant Theory of Gravitation

The first approach was born as an attempt to construct a Poincare invariant theory of gravitation. Space-time, rather than being an abstract manifold endowed with a pseudo-Riemannian structure, is regarded as a surface in the 8-dimensional space  $H = M^4 \times CP_2$ , where  $M^4$  denotes Minkowski space and  $CP_2 = SU(3)/U(2)$  is the complex projective space of two complex dimensions [A7, A11, A5, A10].

The identification of the space-time as a sub-manifold [A8, A14] of  $M^4 \times CP_2$  leads to an exact Poincare invariance and solves the conceptual difficulties related to the definition of the energy-momentum in General Relativity.

It soon however turned out that sub-manifold geometry, being considerably richer in structure than the abstract manifold geometry, leads to a geometrization of all basic interactions. First, the geometrization of the elementary particle quantum numbers is achieved. The geometry of  $CP_2$  explains electro-weak and color quantum numbers. The different H-chiralities of  $H$ -spinors correspond to the conserved baryon and lepton numbers. Secondly, the geometrization of the field concept results. The projections of the  $CP_2$  spinor connection, Killing vector fields of  $CP_2$  and of  $H$ -metric to four-surface define classical electro-weak, color gauge fields and metric in  $X^4$ .

The choice of  $H$  is unique from the condition that TGD has standard model symmetries. Also number theoretical vision selects  $H = M^4 \times CP_2$  uniquely.  $M^4$  and  $CP_2$  are also unique spaces allowing twistor space with Kähler structure.

### TGD as a Generalization of the Hadronic String Model

The second approach was based on the generalization of the mesonic string model describing mesons as strings with quarks attached to the ends of the string. In the 3-dimensional generalization 3-surfaces correspond to free particles and the boundaries of the 3-surface correspond to partons in the sense that the quantum numbers of the elementary particles reside on the boundaries. Various boundary topologies (number of handles) correspond to various fermion families so that one obtains an explanation for the known elementary particle quantum numbers. This approach leads also to a natural topological description of the particle reactions as topology changes: for instance, two-particle decay corresponds to a decay of a 3-surface to two disjoint 3-surfaces.

This decay vertex does not however correspond to a direct generalization of trouser vertex of string models. Indeed, the important difference between TGD and string models is that the analogs of string world sheet diagrams do not describe particle decays but the propagation of particles via different routes. Particle reactions are described by generalized Feynman diagrams for which 3-D light-like surface describing particle propagating join along their ends at vertices. As 4-manifolds the space-time surfaces are therefore singular like Feynman diagrams as 1-manifolds.

Quite recently, it has turned out that fermionic strings inside space-time surfaces define an exact part of quantum TGD and that this is essential for understanding gravitation in long length scales. Also the analog of AdS/CFT duality emerges in that the Kähler metric can be defined either in terms of Kähler function identifiable as Kähler action assignable to Euclidian space-time regions or Kähler action + string action assignable to Minkowskian regions.

The recent view about construction of scattering amplitudes is very “stringy”. By strong form of holography string world sheets and partonic 2-surfaces provide the data needed to construct scattering amplitudes. Space-time surfaces are however needed to realize quantum-classical correspondence necessary to understand the classical correlates of quantum measurement. There is a huge generalization of the duality symmetry of hadronic string models.

The proposal is that scattering amplitudes can be regarded as sequences of computational operations for the Yangian of super-symplectic algebra. Product and co-product define the basic vertices and realized geometrically as partonic 2-surfaces and algebraically as multiplication for the elements of Yangian identified as super-symplectic Noether charges assignable to strings. Any computational sequences connecting given collections of algebraic objects at the opposite boundaries of causal diamond (CD) produce identical scattering amplitudes.

### Fusion of the Two Approaches via a Generalization of the Space-Time Concept

The problem is that the two approaches to TGD seem to be mutually exclusive since the orbit of a particle like 3-surface defines 4-dimensional surface, which differs drastically from the topologically

trivial macroscopic space-time of General Relativity. The unification of these approaches forces a considerable generalization of the conventional space-time concept. First, the topologically trivial 3-space of General Relativity is replaced with a “topological condensate” containing matter as particle like 3-surfaces “glued” to the topologically trivial background 3-space by connected sum operation. Secondly, the assumption about connectedness of the 3-space is given up. Besides the “topological condensate” there could be “vapor phase” that is a “gas” of particle like 3-surfaces and string like objects (counterpart of the “baby universes” of GRT) and the non-conservation of energy in GRT corresponds to the transfer of energy between different sheets of the space-time and possible existence vapour phase.

. What one obtains is what I have christened as many-sheeted space-time (see **Fig.** <http://tgdtheory.fi/appfigures/manysheeted.jpg> or **Fig. ??** in the appendix of this book). One particular aspect is topological field quantization meaning that various classical fields assignable to a physical system correspond to space-time sheets representing the classical fields to that particular system. One can speak of the field body of a particular physical system. Field body consists of topological light rays, and electric and magnetic flux quanta. In Maxwell’s theory the physical system does not possess this kind of field identity. The notion of the magnetic body is one of the key players in TGD inspired theory of consciousness and quantum biology. The existence of monopole flux tubes requiring no current as a source of the magnetic field makes it possible to understand the existence of magnetic fields in cosmological and astrophysical scales.

This picture became more detailed with the advent of zero energy ontology (ZEO). The basic notion of ZEO is causal diamond (CD) identified as the Cartesian product of  $CP_2$  and of the intersection of future and past directed light-cones and having scale coming as an integer multiple of  $CP_2$  size is fundamental. CDs form a fractal hierarchy and zero energy states decompose to products of positive and negative energy parts assignable to the opposite boundaries of CD defining the ends of the space-time surface. The counterpart of zero energy state in positive energy ontology is the pair of initial and final states of a physical event, say particle reaction.

At space-time level ZEO means that 3-surfaces are pairs of space-like 3-surfaces at the opposite light-like boundaries of CD. Since the extremals of Kähler action connect these, one can say that by holography the basic dynamical objects are the space-time surface connecting these 3-surfaces and identifiable as analogs of Bohr orbits. This changes totally the vision about notions like self-organization: self-organization by quantum jumps does not take for a 3-D system but for the entire 4-D field pattern associated with it.

General Coordinate Invariance (GCI) allows to identify the basic dynamical objects as space-like 3-surfaces at the ends of space-time surface at boundaries of CD: this means that space-time surface is analogous to Bohr orbit. An alternative identification of the lines of generalized Feynman diagrams is as light-like 3-surfaces at which the signature of the induced metric changes from Minkowskian to Euclidian. Also the Euclidian 4-D regions can have a similar interpretation. The requirement that the two interpretations are equivalent, leads to a strong form of General Coordinate Invariance. The outcome is effective 2-dimensionality stating that the partonic 2-surfaces identified as intersections of the space-like ends of space-time surface and light-like wormhole throats are the fundamental objects. That only effective 2-dimensionality is in question is due to the effects caused by the failure of strict determinism of Kähler action. In finite length scale resolution these effects can be neglected below UV cutoff and above IR cutoff. One can also speak about a strong form of holography.

The understanding of the super symplectic invariance leads to the proposal that super symplectic algebra and other Kac-Moody type algebras labelled by non-negative multiples of basic conformal weights allow a hierarchy of symmetry breakings in which the analog of gauge symmetry breaks down to a genuine dynamical symmetry. This gives rise to fractal hierarchies of algebras and symmetry breakings. This breaking can occur also for ordinary conformal algebras if one restricts the conformal weights to be non-negative integers.

### 1.1.3 Basic Objections

Objections are the most powerful tool in theory building. The strongest objection against TGD is the observation that all classical gauge fields are expressible in terms of four embedding space coordinates only- essentially  $CP_2$  coordinates. The linear superposition of classical gauge fields taking place independently for all gauge fields is lost. This would be a catastrophe without many-

sheeted space-time. Instead of gauge fields, only the effects such as gauge forces are superposed. Particles topologically condense to several space-time sheets simultaneously and experience the sum of gauge forces. This transforms the weakness to extreme economy: in a typical unified theory the number of primary field variables is countered in hundreds if not thousands, now it is just four.

Second objection is that TGD space-time is quite too simple as compared to GRT space-time due to the embeddability to 8-D embedding space. One can also argue that Poincare invariant theory of gravitation cannot be consistent with General Relativity. The above interpretation makes it possible to understand the relationship to GRT space-time and how the Equivalence Principle (EP) follows from Poincare invariance of TGD. The interpretation of GRT space-time is as effective space-time obtained by replacing many-sheeted space-time with Minkowski space with effective metric determined as a sum of Minkowski metric and sum over the deviations of the induced metrics of the space-time sheets from Minkowski metric. Poincare invariance strongly suggests classical EP for the GRT limit in long length scales at least. One can also consider other kinds of limits such as the analog of GRT limit for Euclidian space-time regions assignable to elementary particles. In this case deformations of  $CP_2$  metric define a natural starting point and  $CP_2$  indeed defines a gravitational instanton with a very large cosmological constant in Einstein-Maxwell theory. Also gauge potentials of the standard model correspond classically to superpositions of induced gauge potentials over space-time sheets.

### Topological Field Quantization

Topological field quantization distinguishes between TGD based and more standard - say Maxwellian - notion of field. In Maxwell's fields created by separate systems superpose and one cannot tell which part of field comes from which system except theoretically. In TGD these fields correspond to different space-time sheets and only their effects on test particle superpose. Hence physical systems have well-defined field identifies - field bodies - in particular magnetic bodies.

The notion of magnetic body carrying dark matter with non-standard large value of Planck constant has become central concept in TGD inspired theory of consciousness and living matter, and by starting from various anomalies of biology one ends up to a rather detailed view about the role of magnetic body as intentional agent receiving sensory input from the biological body and controlling it using EEG and its various scaled up variants as a communication tool. Among other things this leads to models for cell membrane, nerve pulse, and EEG.

#### 1.1.4 Quantum TGD as Spinor Geometry of World of Classical Worlds

A turning point in the attempts to formulate a mathematical theory was reached after seven years from the birth of TGD. The great insight was "Do not quantize". The basic ingredients to the new approach have served as the basic philosophy for the attempt to construct Quantum TGD since then and have been the following ones.

#### World of Classical Worlds

The notion of WCW reduces the interacting quantum theory to a theory of free WCW spinor fields.

1. Quantum theory for extended particles is free(!), classical(!) field theory for a generalized Schrödinger amplitude identified as WCW spinor in the configuration space  $CH$  ("world of classical worlds", WCW) consisting of all possible 3-surfaces in  $H$ . "All possible" means that surfaces with arbitrary many disjoint components and with arbitrary internal topology and also singular surfaces topologically intermediate between two different manifold topologies are included.
2. 4-D general coordinate invariance forces holography and replaces the ill-defined path integral over all space-time surfaces with a discrete sum over 4-D analogs of Bohr orbits for particles identified as 3-surfaces. Holography means that basic objects are these analogs of Bohr orbits. Since there is no quantization at the level of WCW, one has an analog of wave mechanics with point-like particles replaced with 4-D Bohr orbits.

3. One must geometrize WCW as the space of Bohr orbits. In an infinite-dimensional situation the existence of geometry requires maximal symmetries already in the case of loop spaces. Physics is unique from its mathematical existence.

WCW is endowed with metric and spinor structure so that one can define various metric related differential operators, say Dirac operators, appearing in the field equations of the theory <sup>1</sup>

### Identification of Kähler function

The evolution of these basic ideas has been rather slow but has gradually led to a rather beautiful vision. One of the key problems has been the definition of Kähler function. Kähler function is Kähler action for a preferred extremal assignable to a given 3-surface but what this preferred extremal is? The obvious first guess was as absolute minimum of Kähler action but could not be proven to be right or wrong. One big step in the progress was boosted by the idea that TGD should reduce to almost topological QFT in which braids would replace 3-surfaces in finite measurement resolution, which could be inherent property of the theory itself and imply discretization at partonic 2-surfaces with discrete points carrying fermion number.

It took long time to realize that there is no discretization in 4-D sense - this would lead to difficulties with basic symmetries. Rather, the discretization occurs for the parameters characterizing co-dimension 2 objects representing the information about space-time surface so that they belong to some algebraic extension of rationals. These 2-surfaces - string world sheets and partonic 2-surfaces - are genuine physical objects rather than a computational approximation. Physics itself approximates itself, one might say! This is of course nothing but strong form of holography.

1. TGD as almost topological QFT vision suggests that Kähler action for preferred extremals reduces to Chern-Simons term assigned with space-like 3-surfaces at the ends of space-time (recall the notion of causal diamond (CD)) and with the light-like 3-surfaces at which the signature of the induced metric changes from Minkowskian to Euclidian. Minkowskian and Euclidian regions would give at wormhole throats the same contribution apart from coefficients and in Minkowskian regions the  $\sqrt{g_4}$  factor coming from metric would be imaginary so that one would obtain sum of real term identifiable as Kähler function and imaginary term identifiable as the ordinary Minkowskian action giving rise to interference effects and stationary phase approximation central in both classical and quantum field theory.

Imaginary contribution - the presence of which I realized only after 33 years of TGD - could also have topological interpretation as a Morse function. On physical side the emergence of Euclidian space-time regions is something completely new and leads to a dramatic modification of the ideas about black hole interior.

2. The way to achieve the reduction to Chern-Simons terms is simple. The vanishing of Coulomb contribution to Kähler action is required and is true for all known extremals if one makes a general ansatz about the form of classical conserved currents. The so called weak form of electric-magnetic duality defines a boundary condition reducing the resulting 3-D terms to Chern-Simons terms. In this way almost topological QFT results. But only "almost" since the Lagrange multiplier term forcing electric-magnetic duality implies that Chern-Simons action for preferred extremals depends on metric.

### WCW spinor fields

Classical WCW spinor fields are analogous to Schrödinger amplitudes and the construction of WCW Kähler geometry reduces to the second quantization of free spinor fields of  $H$ .

---

<sup>1</sup>There are four kinds of Dirac operators in TGD. The geometrization of quantum theory requires Kähler metric definable either in terms of Kähler function identified as a the bosonic action for Euclidian space-time regions or as anti-commutators for WCW gamma matrices identified as conformal Noether super-charges associated with the second quantized modified Dirac action consisting of string world sheet term and possibly also modified Dirac action in Minkowskian space-time regions. These two possible definitions reflect a duality analogous to AdS/CFT duality.

1. The WCW metric is given by anticommutators of WCW gamma matrices which also have interpretation as supercharges assignable to the generators of WCW isometries and allowing expression as non-conserved Noether charges. Holography implies zero energy ontology (ZEO) meaning that zero energy states are superpositions of Bohr orbits connecting boundaries of causal diamond (CD). CDs form a fractal hierarchy and their space forming the spine of WCW is finite-dimensional and can be geometrized. The alternative interpretation is as a superposition of pairs of ordinary 3-D fermionic states assignable to the ends of the space-time surfaces.
2. There are several Dirac operators. WCW Dirac operator  $D_{WCW}$  appears in Super-symplectic gauge conditions analogous to Super Virasoro conditions. The algebraic variant of the  $H$  Dirac operator  $D_H$  appears in fermionic correlation functions: this is due to the fact that free fermions appearing as building bricks of WCW gamma matrices are modes of  $D_H$ . The modes of  $D_H$  define the ground states of super-symplectic representations. There is also the modified Dirac operator  $D_{X^4}$  acting on the induced spinors at space-time surfaces and it is dictated by symmetry one the action fixing the space-time surfaces as Bohr orbits is fixed.  $D_H$  is needed since it determines the expressions of WCW gamma matrices as Noether charges assignable to 3-surfaces at the ends of WCW.

### The role of modified Dirac action

1. By quantum classical correspondence, the construction of WCW spinor structure in sectors assignable to CDs reduces to the second quantization of the induced spinor fields of  $H$ . The basic action is so called modified Dirac action in which gamma matrices are replaced with the (modified) gamma matrices defined as contractions of the canonical momentum currents of the bosonic action defining the space-time surfaces with the embedding space gamma matrices. In this way one achieves super-conformal symmetry and conservation of fermionic currents among other things and a consistent Dirac equation.

Modified Dirac action is needed to define WCW gamma matrices as super charges assignable to WCW isometry generators identified as generators of symplectic transformations and by holography are needed only at the 3-surface at the boundaries of WCW. It is important to notice that the modified Dirac equation does not determine propagators since induced spinor fields are obtained from free second quantized spinor fields of  $H$ . This means enormous simplification and makes the theory calculable.

2. An important interpretational problem relates to the notion of the induced spinor connection. The presence of classical  $W$  boson fields is in conflict with the classical conservation of em charge since the coupling to classical  $W$  fields changes em charge.

One way out of the problem is the fact that the quantum averages of weak and gluon fields vanish unlike the quantum average of the em field. This leads to a rather precise understanding of electroweak symmetry breaking as being due the fact that color symmetries rotate space-time surfaces and also affect the induced weak fields.

One can also consider a stronger condition. If one requires that the spinor modes have well-defined em charge, one must assume that the modes in the generic situation are localized at 2-D surfaces - string world sheets or perhaps also partonic 2-surfaces - at which classical  $W$  boson fields vanish. Covariantly constant right handed neutrinos generating super-symmetries forms an exception. The vanishing of the  $Z^0$  field is possible for Kähler-Dirac action and should hold true at least above weak length scales. This implies that the string model in 4-D space-time becomes part of TGD. Without these conditions classical weak fields can vanish above weak scale only for the GRT limit of TGD for which gauge potentials are sums over those for space-time sheets.

The localization would simplify the mathematics enormously and one can solve exactly the Kähler-Dirac equation for the modes of the induced spinor field just like in super string models.

At the light-like 3-surfaces the signature of the induced metric changes from Euclidian to Minkowskian so that  $\sqrt{g_4}$  vanishes. One can pose the condition that the algebraic analog of

the massless Dirac equation is satisfied by the modes of the modified-Dirac action assignable to the Chern-Simons-Kähler action.

### 1.1.5 Construction of scattering amplitudes

#### Reduction of particle reactions to space-time topology

Particle reactions are identified as topology changes [A13, A15, A18]. For instance, the decay of a 3-surface to two 3-surfaces corresponds to the decay  $A \rightarrow B + C$ . Classically this corresponds to a path of WCW leading from 1-particle sector to 2-particle sector. At quantum level this corresponds to the dispersion of the generalized Schrödinger amplitude localized to 1-particle sector to two-particle sector. All coupling constants should result as predictions of the theory since no nonlinearities are introduced.

During years this naïve and very rough vision has of course developed a lot and is not anymore quite equivalent with the original insight. In particular, the space-time correlates of Feynman graphs have emerged from theory as Euclidian space-time regions and the strong form of General Coordinate Invariance has led to a rather detailed and in many respects un-expected visions. This picture forces to give up the idea about smooth space-time surfaces and replace space-time surface with a generalization of Feynman diagram in which vertices represent the failure of manifold property. I have also introduced the word “world of classical worlds” (WCW) instead of rather formal “configuration space”. I hope that “WCW” does not induce despair in the reader having tendency to think about the technicalities involved!

#### Construction of the counterparts of S-matrices

What does one mean with the counterpart of S-matrix in the TGD framework has been a long standing problem. The development of ZEO based quantum measurement theory has led to a rough overall view of the situation.

1. There are two kinds of state function reductions (SFRs). “Small” SFRs (SSFRs) following the TGD counterpart of a unitary time evolution defines a sequence of SFRs, which is analogous to a sequence of repeated quantum measurements associated with the Zeno effect. In wave mechanics nothing happens in these measurements. In quantum optics these measurements correspond to weak measurements. In TGD SSFR affects the zero energy state but leaves the 3-D state at the passive boundary of CD unaffected.
2. In TGD framework each SSFR is preceded by a counterpart of a unitary time evolution, which means dispersion in the space of CDs and unitary time evolution in fermionic degrees of freedom such that the passive boundary of CDs and 3-D states at it are unaffected but a superposition of CDs with varying active boundaries in the space of CDs is formed. In SSFR a localization in the space of CDs occurs such that the active is fixed. In a statistical sense the size of the CD increases and the increasing distance between the tips of the CD gives rise to the arrow of geometric time.
3. Also “big” SFRs (BSFRs) can occur and they correspond to ordinary SFRs. In BSFR the roles of the active and passive boundary are changed and this means that the arrow of time is changed. Big SFR occurs when the SSFR corresponds to a quantum measurement, which does not commute with the operators, which define the states at the passive boundary of CD as their eigenstates. This means a radical deviation from standard quantum measurement theory and has predictions in all scales.
4. One can assign the counterpart of S-matrix to the unitary time evolution between two subsequent SSFRs and also to the counterpart of S-matrix associated with BSFR. At least in the latter case the dimension of the state space can increase since at least BSFRs lead to the increase of the dimension of algebraic extension of rationals assignable to the space-time surface by  $M^8 - H$  duality. Unitarity is therefore replaced with isometry.
5. I have also considered the possibility that unitary S-matrix could be replaced in the fermionic degrees of freedom with Kähler metric of the state space satisfying analogs of unitarity conditions but it seems that this is un-necessary and also too outlandish an idea.

### The notion of M-matrix

1. The most ambitious dream is that zero energy states correspond to a complete solution basis for the Dirac operators associated with WCWs associated with the spaces of CDs with fixed passive boundary: this would define an S-matrix assignable to SFR. Also the analog of S-matrix for the localizations of the states to the active boundary assignable to the BSFR changing the state at the passive boundary of CD is needed.
2. If one allows entanglement between positive and energy parts of the zero energy state but assumes that the states at the passive boundary are fixed, one must introduce the counterpart of the density matrix, or rather its square root. This classical free field theory would dictate what I have called M-matrices defined between positive and negative energy parts of zero energy states which form orthonormal rows of what I call U-matrix as a matrix defined between zero energy states. A given M-matrix in turn would decompose to a product of a hermitian square root of density matrix and unitary S-matrix.
3. M-matrix would define time-like entanglement coefficients between positive and negative energy parts of zero energy states (all net quantum numbers vanish for them) and can be regarded as a hermitian square root of density matrix multiplied by a unitary S-matrix. Quantum theory would be in a well-defined sense a square root of thermodynamics. The orthogonality and hermiticity of the M-matrices commuting with S-matrix means that they span infinite-dimensional Lie algebras acting as symmetries of the S-matrix. Therefore quantum TGD would reduce to group theory in a well-defined sense.
4. In fact the Lie algebra of Hermitian M-matrices extends to Kac-Moody type algebra obtained by multiplying hermitian square roots of density matrices with powers of the S-matrix. Also the analog of Yangian algebra involving only non-negative powers of S-matrix is possible and would correspond to a hierarchy of CDs with the temporal distances between tips coming as integer multiples of the  $CP_2$  time.

The M-matrices associated with CDs are obtained by a discrete scaling from the minimal CD and characterized by integer  $n$  are naturally proportional to a representation matrix of scaling:  $S(n) = S^n$ , where  $S$  is unitary S-matrix associated with the minimal CD [K53]. This conforms with the idea about unitary time evolution as exponent of Hamiltonian discretized to integer power of  $S$  and represented as scaling with respect to the logarithm of the proper time distance between the tips of CD.

5. I have also considered the notion of U-matrix. U-matrix elements between M-matrices for various CDs are proportional to the inner products  $Tr[S^{-n_1} \circ H^i H^j \circ S^{n_2} \lambda]$ , where  $\lambda$  represents unitarily the discrete Lorentz boost relating the moduli of the active boundary of CD and  $H^i$  form an orthonormal basis of Hermitian square roots of density matrices.  $\circ$  tells that  $S$  acts at the active boundary of CD only. I have proposed a general representation for the U-matrix, reducing its construction to that of the S-matrix.

### 1.1.6 TGD as a generalized number theory

Quantum T(opological)D(ynamics) as a classical spinor geometry for infinite-dimensional configuration space (“world of classical worlds”, WCW), p-adic numbers and quantum TGD, and TGD inspired theory of consciousness, have been for last ten years the basic three strongly interacting threads in the tapestry of quantum TGD. The fourth thread deserves the name “TGD as a generalized number theory”. It involves three separate threads: the fusion of real and various p-adic physics to a single coherent whole by requiring number theoretic universality discussed already, the formulation of quantum TGD in terms of complexified counterparts of classical number fields, and the notion of infinite prime. Note that one can identify subrings such as hyper-quaternions and hyper-octonions as sub-spaces of complexified classical number fields with Minkowskian signature of the metric defined by the complexified inner product.

### The Threads in the Development of Quantum TGD

The development of TGD has involved several strongly interacting threads: physics as infinite-dimensional geometry; TGD as a generalized number theory, the hierarchy of Planck constants interpreted in terms of dark matter hierarchy, and TGD inspired theory of consciousness. In the following these threads are briefly described.

1. Quantum T(opological) G(eometro)D(ynamics) as a classical spinor geometry for infinite-dimensional WCW, p-adic numbers and quantum TGD, and TGD inspired theory of consciousness and of quantum biology have been for last decade of the second millenium the basic three strongly interacting threads in the tapestry of quantum TGD.
2. The discussions with Tony Smith initiated a fourth thread which deserves the name “TGD as a generalized number theory”. The basic observation was that classical number fields might allow a deeper formulation of quantum TGD. The work with Riemann hypothesis made time ripe for realization that the notion of infinite primes could provide, not only a reformulation, but a deep generalization of quantum TGD. This led to a thorough and rather fruitful revision of the basic views about what the final form and physical content of quantum TGD might be. Together with the vision about the fusion of p-adic and real physics to a larger coherent structure these sub-threads fused to the “physics as generalized number theory” thread.
3. A further thread emerged from the realization that by quantum classical correspondence TGD predicts an infinite hierarchy of macroscopic quantum systems with increasing sizes, that it is not at all clear whether standard quantum mechanics can accommodate this hierarchy, and that a dynamical quantized Planck constant might be necessary and strongly suggested by the failure of strict determinism for the fundamental variational principle. The identification of hierarchy of Planck constants labelling phases of dark matter would be natural. This also led to a solution of a long standing puzzle: what is the proper interpretation of the predicted fractal hierarchy of long ranged classical electro-weak and color gauge fields. Quantum classical correspondences allows only single answer: there is infinite hierarchy of p-adically scaled up variants of standard model physics and for each of them also dark hierarchy. Thus TGD Universe would be fractal in very abstract and deep sense.

The chronology based identification of the threads is quite natural but not logical and it is much more logical to see p-adic physics, the ideas related to classical number fields, and infinite primes as sub-threads of a thread which might be called “physics as a generalized number theory”. In the following I adopt this view. This reduces the number of threads to three corresponding to geometric, number theoretic and topological views of physics.

TGD forces the generalization of physics to a quantum theory of consciousness, and TGD as a generalized number theory vision leads naturally to the emergence of p-adic physics as physics of cognitive representations.

### Number theoretic vision very briefly

Number theoretic vision about quantum TGD involves notions like adelic physics,  $M^8 - H$  duality and number theoretic universality. A short review of the basic ideas that have developed during years is in order.

1. The physical interpretation of  $M^8$  is as an analog of momentum space and  $M^8 - H$  duality is analogous to momentum-position duality of ordinary wave mechanics.
2. Adelic physics means that all classical number fields, all p-adic number fields and their extensions induced by extensions of rationals and defining adeles, and also finite number fields are basic mathematical building bricks of physics.

The complexification of  $M^8$ , identified as complexified octonions, would provide a realization of this picture and  $M^8 - H$  duality would map the algebraic physics in  $M^8$  to the ordinary physics in  $M^4 \times CP_2$  described in terms of partial differential equations.

3. Negentropy Maximization Principle (NMP) states that the conscious information assignable with cognition representable measured in terms of p-adic negentropy increases in statistical sense.

NMP is mathematically completely analogous to the second law of thermodynamics and number theoretic evolution as an unavoidable statistical increase of the dimension of the algebraic extension of rationals characterizing a given space-time region implies it. There is no paradox involved: the p-adic negentropy measures the conscious information assignable to the entanglement of two systems regarded as a conscious entity whereas ordinary entropy measures the lack of information about the quantum state of either entangled system.

4. Number theoretical universality requires that space-time surfaces or at least their  $M^8 - H$  duals in  $M_c^8$  are defined for both reals and various p-adic number fields. This is true if they are defined by polynomials with integer coefficients as surfaces in  $M^8$  obeying number theoretic holography realized as associativity of the normal space of 4-D surface using as holographic data 3-surfaces at mass shells identified in terms of roots of a polynomial. A physically motivated additional condition is that the coefficients of the polynomials are smaller than their degrees.
5. Galois confinement is a key piece of the number theoretic vision. It states that the momenta of physical states are algebraic integers in the extensions of rationals assignable to the space-time region considered. These numbers are in general complex and are not consistent with particle in box quantization. The proposal is that physical states satisfy Galois confinement being thus Galois singlets and having therefore total momenta, whose components are ordinary integers, when momentum unit defined by the scale of causal diamond (CD) is used.
6. The notion of p-adic prime was introduced in p-adic mass calculations that started the developments around 1995. p-Adic length scale hypothesis states that p-adic primes near powers of 2 have a special physical role (as possibly also the powers of other small primes such as  $p = 3$ ).

The proposal is that p-adic primes correspond to ramified primes assignable to the extension and identified as divisors of the polynomial defined by the products of the root differences for the roots of the polynomial defining space-time space and having interpretation as values of, in general complex, virtual mass squared.

### **p-Adic TGD and fusion of real and p-adic physics to single coherent whole**

The p-adic thread emerged for roughly ten years ago as a dim hunch that p-adic numbers might be important for TGD. Experimentation with p-adic numbers led to the notion of canonical identification mapping reals to p-adics and vice versa. The breakthrough came with the successful p-adic mass calculations using p-adic thermodynamics for Super-Virasoro representations with the super-Kac-Moody algebra associated with a Lie-group containing standard model gauge group. Although the details of the calculations have varied from year to year, it was clear that p-adic physics reduces not only the ratio of proton and Planck mass, the great mystery number of physics, but all elementary particle mass scales, to number theory if one assumes that primes near prime powers of two are in a physically favored position. Why this is the case, became one of the key puzzles and led to a number of arguments with a common gist: evolution is present already at the elementary particle level and the primes allowed by the p-adic length scale hypothesis are the fittest ones.

It became very soon clear that p-adic topology is not something emerging in Planck length scale as often believed, but that there is an infinite hierarchy of p-adic physics characterized by p-adic length scales varying to even cosmological length scales. The idea about the connection of p-adics with cognition motivated already the first attempts to understand the role of the p-adics and inspired "Universe as Computer" vision but time was not ripe to develop this idea to anything concrete (p-adic numbers are however in a central role in TGD inspired theory of consciousness). It became however obvious that the p-adic length scale hierarchy somehow corresponds to a hierarchy of intelligences and that p-adic prime serves as a kind of intelligence quotient. Ironically, the almost obvious idea about p-adic regions as cognitive regions of space-time providing cognitive representations for real regions had to wait for almost a decade for the access into my consciousness.

In string model context one tries to reduce the physics to Planck scale. The price is the inability to say anything about physics in long length scales. In TGD p-adic physics takes care of this shortcoming by predicting the physics also in long length scales.

There were many interpretational and technical questions crying for a definite answer.

1. What is the relationship of p-adic non-determinism to the classical non-determinism of the basic field equations of TGD? Are the p-adic space-time region genuinely p-adic or does p-adic topology only serve as an effective topology? If p-adic physics is direct image of real physics, how the mapping relating them is constructed so that it respects various symmetries? Is the basic physics p-adic or real (also real TGD seems to be free of divergences) or both? If it is both, how should one glue the physics in different number field together to get *the* Physics? Should one perform p-adicization also at the level of the WCW? Certainly the p-adicization at the level of super-conformal representation is necessary for the p-adic mass calculations.
2. Perhaps the most basic and most irritating technical problem was how to precisely define p-adic definite integral which is a crucial element of any variational principle based formulation of the field equations. Here the frustration was not due to the lack of solution but due to the too large number of solutions to the problem, a clear symptom for the sad fact that clever inventions rather than real discoveries might be in question. Quite recently I however learned that the problem of making sense about p-adic integration has been for decades central problem in the frontier of mathematics and a lot of profound work has been done along same intuitive lines as I have proceeded in TGD framework. The basic idea is certainly the notion of algebraic continuation from the world of rationals belonging to the intersection of real world and various p-adic worlds.

Despite various uncertainties, the number of the applications of the poorly defined p-adic physics has grown steadily and the applications turned out to be relatively stable so that it was clear that the solution to these problems must exist. It became only gradually clear that the solution of the problems might require going down to a deeper level than that represented by reals and p-adics.

The key challenge is to fuse various p-adic physics and real physics to single larger structure. This has inspired a proposal for a generalization of the notion of number field by fusing real numbers and various p-adic number fields and their extensions along rationals and possible common algebraic numbers. This leads to a generalization of the notions of embedding space and space-time concept and one can speak about real and p-adic space-time sheets. One can talk about adelic space-time, embedding space, and WCW.

The corresponds of real 4-surfaces with the p-adic ones is induced by number theoretical discretization using points of 4-surfaces  $Y^4 \subset M_c^8$  identifiable as 8-momenta, whose components are assumed to be algebraic integers in an extension of rationals defined by the extension of rationals associated with a polynomial  $P$  with integer coefficients smaller than the degree of  $P$ . These points define a cognitive representation, which is universal in the sense that it exists also in the algebraic extensions of p-adic numbers. The points of the cognitive representations associated with the mass shells with mass squared values identified as roots of  $P$  are enough since  $M^8 - H$  duality can be used at both  $M^8$  and  $H$  sides and also in the p-adic context. The mass shells are special in that they allow for Minkowski coordinates very large cognitive representations unlike the interiors of the 4-surfaces determined by holography by using the data defined by the 3-surfaces at the mass shells. The higher the dimension of the algebraic extension associated with  $P$ , the better the accuracy of the cognitive representation.

Adelization providing number theoretical universality reduces to algebraic continuation for the amplitudes from this intersection of reality and various p-adicities - analogous to a back of a book - to various number fields. There are no problems with symmetries but canonical identification is needed: various group invariant of the amplitude are mapped by canonical identification to various p-adic number fields. This is nothing but a generalization of the mapping of the p-adic mass squared to its real counterpart in p-adic mass calculations.

This leads to surprisingly detailed predictions and far reaching conjectures. For instance, the number theoretic generalization of entropy concept allows negentropic entanglement central for the applications to living matter (see **Fig.** <http://tgdtheory.fi/appfigures/cat.jpg> or **Fig. ??** in the appendix of this book). One can also understand how preferred p-adic primes could

emerge as so called ramified primes of algebraic extension of rationals in question and characterizing string world sheets and partonic 2-surfaces. Preferred p-adic primes would be ramified primes for extensions for which the number of p-adic continuations of two-surfaces to space-time surfaces (imaginings) allowing also real continuation (realization of imagination) would be especially large. These ramifications would be winners in the fight for number theoretical survival. Also a generalization of p-adic length scale hypothesis emerges from NMP [K50].

The characteristic non-determinism of the p-adic differential equations suggests strongly that p-adic regions correspond to “mind stuff”, the regions of space-time where cognitive representations reside. This interpretation implies that p-adic physics is physics of cognition. Since Nature is probably a brilliant simulator of Nature, the natural idea is to study the p-adic physics of the cognitive representations to derive information about the real physics. This view encouraged by TGD inspired theory of consciousness clarifies difficult interpretational issues and provides a clear interpretation for the predictions of p-adic physics.

### Infinite primes

The discovery of the hierarchy of infinite primes and their correspondence with a hierarchy defined by a repeatedly second quantized arithmetic quantum field theory gave a further boost for the speculations about TGD as a generalized number theory.

After the realization that infinite primes can be mapped to polynomials possibly representable as surfaces geometrically, it was clear how TGD might be formulated as a generalized number theory with infinite primes forming the bridge between classical and quantum such that real numbers, p-adic numbers, and various generalizations of p-adics emerge dynamically from algebraic physics as various completions of the algebraic extensions of complexified quaternions and octonions. Complete algebraic, topological and dimensional democracy would characterize the theory.

The infinite primes at the first level of hierarchy, which represent analogs of bound states, can be mapped to irreducible polynomials, which in turn characterize the algebraic extensions of rationals defining a hierarchy of algebraic physics continuable to real and p-adic number fields. The products of infinite primes in turn define more general algebraic extensions of rationals. The interesting question concerns the physical interpretation of the higher levels in the hierarchy of infinite primes and integers mappable to polynomials of  $n > 1$  variables.

### 1.1.7 An explicit formula for $M^8 - H$ duality

$M^8 - H$  duality is a generalization of momentum-position duality relating the number theoretic and geometric views of physics in TGD and, despite that it still involves poorly understood aspects, it has become a fundamental building block of TGD. One has 4-D surfaces  $Y^4 \subset M_c^8$ , where  $M_c^8$  is complexified  $M^8$  having interpretation as an analog of complex momentum space and 4-D spacetime surfaces  $X^4 \subset H = M^4 \times CP_2$ .  $M_c^8$ , equivalently  $E_c^8$ , can be regarded as complexified octonions.  $M_c^8$  has a subspace  $M_c^4$  containing  $M^4$ .

**Comment:** One should be very cautious with the meaning of “complex”. Complexified octonions involve a complex imaginary unit  $i$  commuting with the octonionic imaginary units  $I_k$ .  $i$  is assumed to also appear as an imaginary unit also in complex algebraic numbers defined by the roots of polynomials  $P$  defining holographic data in  $M_c^8$ .

In the following  $M^8 - H$  duality and its twistor lift are discussed and an explicit formula for the dualities are deduced. Also possible variants of the duality are discussed.

### Holography in $H$

$X^4 \subset H$  satisfies holography and is analogous to the Bohr orbit of a particle identified as a 3-surface. The proposal is that holography reduces to a 4-D generalization of holomorphy so that  $X^4$  is a simultaneous zero of two functions of complex  $CP_2$  coordinates and of what I have called Hamilton-Jacobi coordinates of  $M^4$  with a generalized Kähler structure.

The simplest choice of the Hamilton-Jacobi coordinates is defined by the decomposition  $M^4 = M^2 \times E^2$ , where  $M^2$  is endowed with hypercomplex structure defined by light-like coordinates  $(u, v)$ , which are analogous to  $z$  and  $\bar{z}$ . Any analytic map  $u \rightarrow f(u)$  defines a new set

of light-like coordinates and corresponds to a solution of the massless d'Alembert equation in  $M^2$ .  $E^2$  has some complex coordinates with imaginary unit defined by  $i$ .

The conjecture is that also more general Hamilton-Jacobi structures for which the tangent space decomposition is local are possible. Therefore one would have  $M^4 = M^2(x) \times E^2(x)$ . These would correspond to non-equivalent complex and Kähler structures of  $M^4$  analogous to those possessed by 2-D Riemann surfaces and parametrized by moduli space.

### Number theoretic holography in $M_c^8$

$Y^4 \subset M_c^8$  satisfies number theoretic holography defining dynamics, which should reduce to associativity in some sense. The Euclidian complexified normal space  $N^4(y)$  at a given point  $y$  of  $Y^4$  is required to be associative, i.e. quaternionic. Besides this,  $N^4(i)$  contains a preferred complex Euclidian 2-D subspace  $Y^2(y)$ . Also the spaces  $Y^2(x)$  define an integrable distribution. I have assumed that  $Y^2(x)$  can depend on the point  $y$  of  $Y^4$ .

These assumptions imply that the normal space  $N(y)$  of  $Y^4$  can be parameterized by a point of  $CP_2 = SU(3)/U(2)$ . This distribution is always integrable unlike quaternionic tangent space distributions.  $M^8 - H$  duality assigns to the normal space  $N(y)$  a point of  $CP_2$ .  $M_c^4$  point  $y$  is mapped to a point  $x \in M^4 \subset M^4 \times CP_2$  defined by the real part of its inversion (conformal transformation): this formula involves effective Planck constant for dimensional reasons.

The 3-D holographic data, which partially fixes 4-surfaces  $Y^4$  is partially determined by a polynomial  $P$  with real integer coefficients smaller than the degree of  $P$ . The roots define mass squared values which are in general complex algebraic numbers and define complex analogs of mass shells in  $M_c^4 \subset M_c^8$ , which are analogs of hyperbolic spaces  $H^3$ . The 3-surfaces at these mass shells define 3-D holographic data continued to a surface  $Y^4$  by requiring that the normal space of  $Y^4$  is associative, i.e. quaternionic. These 3-surfaces are not completely fixed but an interesting conjecture is that they correspond to fundamental domains of tessellations of  $H^3$ .

What does the complexity of the mass shells mean? The simplest interpretation is that the space-like  $M^4$  coordinates (3-momentum components) are real whereas the time-like coordinate (energy) is complex and determined by the mass shell condition. One would have  $Re^2(E) - Im(E)^2 - p^2 = Re(m^2)$  and  $2Re(E)Im(E) = Im(m^2)$ . The condition for the real parts gives  $H^3$  when  $\sqrt{Re^2(E) - Im(E)^2}$  is taken as a time coordinate. The second condition allows to solve  $Im(E)$  in terms of  $Re(E)$  so that the first condition reduces to an equation of mass shell when  $\sqrt{(Re(E)^2 - Im(E)^2)}$ , expressed in terms of  $Re(E)$ , is taken as new energy coordinate  $E_{eff} = \sqrt{(Re(E)^2 - Im(E)^2)}$ . Is this deformation of  $H^3$  in imaginary time direction equivalent with a region of the hyperbolic 3-space  $H^3$ ?

One can look at the formula in more detail. Mass shell condition gives  $Re^2(E) - Im(E)^2 - p^2 = Re(m^2)$  and  $2Re(E)Im(E) = Im(m^2)$ . The condition for the real parts gives  $H^3$ , when  $\sqrt{Re^2(E) - Im(E)^2}$  is taken as an effective energy. The second condition allows to solve  $Im(E)$  in terms of  $Re(E)$  so that the first condition reduces to a dispersion relation for  $Re(E)^2$ .

$$Re(E)^2 = \frac{1}{2}(Re(m^2) - Im(m^2) + p^2)(1 \pm \sqrt{1 + \frac{2Im(m^2)^2}{(Re(m^2) - Im(m^2) + p^2)^2}}) \quad (1.1.1)$$

Only the positive root gives a non-tachyonic result for  $Re(m^2) - Im(m^2) > 0$ . For real roots with  $Im(m^2) = 0$  and at the high momentum limit the formula coincides with the standard formula. For  $Re(m^2) = Im(m^2)$  one obtains  $Re(E)^2 \rightarrow Im(m^2)/\sqrt{2}$  at the low momentum limit  $p^2 \rightarrow 0$ . Energy does not depend on momentum at all: the situation resembles that for plasma waves.

### Can one find an explicit formula for $M^8 - H$ duality?

The dream is an explicit formula for the  $M^8 - H$  duality mapping  $Y^4 \subset M_c^8$  to  $X^4 \subset H$ . This formula should be consistent with the assumption that the generalized holomorphy holds true for  $X^4$ .

The following proposal is a more detailed variant of the earlier proposal for which  $Y^4$  is determined by a map  $g$  of  $M_c^4 \rightarrow SU(3)_c \subset G_{2,c}$ , where  $G_{2,c}$  is the complexified automorphism group of octonions and  $SU(3)_c$  is interpreted as a complexified color group.

This map defines a trivial  $SU(3)_c$  gauge field. The real part of  $g$  however defines a non-trivial real color gauge field by the non-linearity of the non-abelian gauge field with respect to the gauge potential. The quadratic terms involving the imaginary part of the gauge potential give an additional condition to the real part in the complex situation and cancel it. If only the real part of  $g$  contributes, this contribution would be absent and the gauge field is non-vanishing.

How could the automorphism  $g(x) \subset SU(3) \subset G_2$  give rise to  $M^8 - H$  duality?

1. The interpretation is that  $g(y)$  at given point  $y$  of  $Y^4$  relates the normal space at  $y$  to a fixed quaternionic/associative normal space at point  $y_0$ , which corresponds is fixed by some subgroup  $U(2)_0 \subset SU(3)$ . The automorphism property of  $g$  guarantees that the normal space is quaternionic/associative at  $y$ . This simplifies the construction dramatically.
2. The quaternionic normal sub-space (which has Euclidian signature) contains a complex sub-space which corresponds to a point of sphere  $S^2 = SO(3)/O(2)$ , where  $SO(3)$  is the quaternionic automorphism group. The interpretation could be in terms of a selection of spin quantization axes. The local choice of the preferred complex plane would not be unique and is analogous to the possibility of having non-trivial Hamilton Jacobi structures in  $M^4$  characterized by the choice of  $M^2(x)$  and equivalently its normal subspace  $E^2(x)$ .

These two structures are independent apart from dependencies forced by the number theoretic dynamics. Hamilton-Jacobi structure means a selection of the quantization axis of spin and energy by fixing a distribution of light-like tangent vectors of  $M^4$  and the choice of the quaternionic normal sub-space fixes a choice of preferred quaternionic imaginary unit defining a quantization axis of the weak isospin.

3. The real part  $Re(g(y))$  defines a point of  $SU(3)$  and the bundle projection  $SU(3) \rightarrow CP_2$  in turn defines a point of  $CP_2 = SU(3)/U(2)$ . Hence one can assign to  $g$  a point of  $CP_2$  as  $M^8 - H$  duality requires and deduce an explicit formula for the point. This means a realization of the dream.
4. The construction requires a fixing of a quaternionic normal space  $N_0$  at  $y_0$  containing a preferred complex subspace at a single point of  $Y^4$  plus a selection of the function  $g$ . If  $M^4$  coordinates are possible for  $Y^4$ , the first guess is that  $g$  as a function of complexified  $M^4$  coordinates obeys generalized holomorphy with respect to complexified  $M^4$  coordinates in the same sense and in the case of  $X^4$ . This might guarantee that the  $M^8 - H$  image of  $Y^4$  satisfies the generalized holomorphy.
5. Also space-time surfaces  $X^4$  with  $M^4$  projection having a dimension smaller than 4 are allowed. I have proposed that they might correspond to singular cases for the above formula: a kind of blow-up would be involved. One can also consider a more general definition of  $Y^4$  allowing it to have a  $M^4$  projection with dimension smaller than 4 (say cosmic strings). Could one have implicit equations for the surface  $Y^4$  in terms of the complex coordinates of  $SU(3)_c$  and  $M^4$ ? Could this give for instance cosmic strings with a 2-D  $M^4$  projection and  $CP_2$  type extremals with 4-D  $CP_2$  projection and 1-D light-like  $M^4$  projection?

### What could the number theoretic holography mean physically?

What could be physical meaning of the number theoretic holography? The condition that has been assumed is that the  $CP_2$  coordinates at the mass shells of  $M_c^4 \subset M_c^8$  mapped to mass shells  $H^3$  of  $M^4 \subset M^4 \times CP_2$  are constant at the  $H^3$ . This is true if the  $g(y)$  defines the same  $CP_2$  point for a given component  $X_i^3$  of the 3-surface at a given mass shell.  $g$  is therefore fixed apart from a local  $U(2)$  transformation leaving the  $CP_2$  point invariant. A stronger condition would be that the  $CP_2$  point is the same for each component of  $X_i^3$  and even at each mass shell but this condition seems to be unnecessarily strong.

**Comment:** One can criticize this condition as too strong and one can consider giving up this condition. The motivation for this condition is that the number of algebraic points at the 3-surfaces associated with  $H^3$  explodes since the coordinates associated with normal directions vanish. Kind of cognitive explosion would be in question.

$SU(3)$  corresponds to a subgroup of  $G_2$  and one can wonder what the fixing of this subgroup could mean physically.  $G_2$  is 14-D and the coset space  $G_2/SU(3)$  is 6-D and a good guess is that

it is just the 6-D twistor space  $SU(3)/U(1) \times U(1)$  of  $CP_2$ : at least the isometries are the same. The fixing of the  $SU(3)$  subgroup means fixing of a  $CP_2$  twistor. Physically this means the fixing of the quantization axis of color isospin and hypercharge.

### Twistor lift of the holography

What is interesting is that by replacing  $SU(3)$  with  $G_2$ , one obtains an explicit formula from the generalization of  $M^8 - H$  duality to that for the twistorial lift of TGD!

One can also consider a twistorial generalization of the above proposal for the number theoretic holography by allowing local  $G_2$  automorphisms interpreted as local choices of the color quantization axis.  $G_2$  elements would be fixed apart from a local  $SU(3)$  transformation at the components of 3-surfaces at mass shells. The choice of the color quantization axes for a connected 3-surface at a given mass shell would be the same everywhere. This choice is indeed very natural physically since 3-surface corresponds to a particle.

Is this proposal consistent with the boundary condition of the number theoretical holography mean in the case of 4-surfaces in  $M_c^8$  and  $M^4 \times CP_2$ ?

1. The selection of  $SU(3) \subset G_2$  for ordinary  $M^8 - H$  duality means that the  $G_{2,c}$  gauge field vanishes everywhere and the choice of color quantization axis is the same at all points of the 4-surface. The fixing of the  $CP_2$  point to be constant at  $H^3$  implies that the color gauge field at  $H^3 \subset M_c^8$  and its image  $H^3 \subset H$  vanish. One would have color confinement at the mass shells  $H_i^3$ , where the observations are made. Is this condition too strong?
2. The constancy of the  $G_2$  element at mass shells makes sense physically and means a fixed color quantization axis. The selection of a fixed  $SU(3) \subset G_2$  for entire space-time surface is in conflict with the non-constancy of  $G_2$  element unless  $G_2$  element differs at different points of 4-surface only by a multiplication of a local  $SU(3)_0$  element, that is local  $SU(3)$  transformation. This kind of variation of the  $G_2$  element would mean a fixed color group but varying choice of color quantization axis.
3. Could one consider the possibility that the local  $G_{2,c}$  element is free and defines the twistor lift of  $M^8 - H$  duality as something more fundamental than the ordinary  $M^8 - H$  duality based on  $SU(3)_c$ . This duality would make sense only at the mass shells so that only the spaces  $H^3 \times CP_2$  assignable to mass shells would make sense physically? In the interior  $CP_2$  would be replaced with the twistor space  $SU(3)/U(1) \times U(1)$ . Color gauge fields would be non-vanishing at the mass shells but outside the mass shells one would have  $G_2$  gauge fields.

There is also a physical objection against the  $G_2$  option. The 14-D Lie algebra representation of  $G_2$  acts on the imaginary octonions which decompose with respect to the color group to  $1 \oplus 3 \oplus \bar{3}$ . The automorphism property requires that 1 can be transformed to 3 or  $\bar{3}$  to themselves: this requires that the decomposition contains  $3 \oplus \bar{3}$ . Furthermore, it must be possible to transform 3 and  $\bar{3}$  to themselves, which requires the presence of 8. This leaves only the decomposition  $8 \oplus 3 \oplus \bar{3}$ .  $G_2$  gluons would both color octet and triplets. In the TDG framework the only conceivable interpretation would be in terms of ordinary gluons and leptoquark-like gluons. This does not fit with the basic vision of TGD.

The choice of twistor as a selection of quantization axes should make sense also in the  $M^4$  degrees of freedom.  $M^4$  twistor corresponds to a choice of light-like direction at a given point of  $M^4$ . The spatial component of the light-like vector fixes the spin quantization axis. Its choice together with the light-likeness fixes the time direction and therefore the rest system and energy quantization axis. Light-like vector fixes also the choice of  $M^2$  and of  $E^2$  as its orthogonal complement. Therefore the fixing of  $M^4$  twistor as a point of  $SU(4)/SU(3) \times U(1)$  corresponds to a choice of the spin quantization axis and the time-like axis defining the rest system in which the energy is measured. This choice would naturally correspond to the Hamilton-Jacobi structure fixing the decompositions  $M^2(x) \times E^2(x)$ . At a given mass shell the choice of the quantization axis would be constant for a given  $X_i^3$ .

### 1.1.8 Hierarchy of Planck Constants and Dark Matter Hierarchy

By quantum classical correspondence space-time sheets can be identified as quantum coherence regions. Hence the fact that they have all possible size scales more or less unavoidably implies that Planck constant must be quantized and have arbitrarily large values. If one accepts this then also the idea about dark matter as a macroscopic quantum phase characterized by an arbitrarily large value of Planck constant emerges naturally as does also the interpretation for the long ranged classical electro-weak and color fields predicted by TGD. Rather seldom the evolution of ideas follows simple linear logic, and this was the case also now. In any case, this vision represents the fifth, relatively new thread in the evolution of TGD and the ideas involved are still evolving.

#### Dark Matter as Large $\hbar$ Phases

D. Da Rocha and Laurent Nottale [E4] have proposed that Schrödinger equation with Planck constant  $\hbar$  replaced with what might be called gravitational Planck constant  $\hbar_{gr} = \frac{GmM}{v_0}$  ( $\hbar = c = 1$ ).  $v_0$  is a velocity parameter having the value  $v_0 = 144.7 \pm .7$  km/s giving  $v_0/c = 4.6 \times 10^{-4}$ . This is rather near to the peak orbital velocity of stars in galactic halos. Also subharmonics and harmonics of  $v_0$  seem to appear. The support for the hypothesis coming from empirical data is impressive.

Nottale and Da Rocha believe that their Schrödinger equation results from a fractal hydrodynamics. Many-sheeted space-time however suggests that astrophysical systems are at some levels of the hierarchy of space-time sheets macroscopic quantum systems. The space-time sheets in question would carry dark matter.

Nottale's hypothesis would predict a gigantic value of  $\hbar_{gr}$ . Equivalence Principle and the independence of gravitational Compton length on mass  $m$  implies however that one can restrict the values of mass  $m$  to masses of microscopic objects so that  $\hbar_{gr}$  would be much smaller. Large  $\hbar_{gr}$  could provide a solution of the black hole collapse (IR catastrophe) problem encountered at the classical level. The resolution of the problem inspired by TGD inspired theory of living matter is that it is the dark matter at larger space-time sheets which is quantum coherent in the required time scale [K80].

It is natural to assign the values of Planck constants postulated by Nottale to the space-time sheets mediating gravitational interaction and identifiable as magnetic flux tubes (quanta) possibly carrying monopole flux and identifiable as remnants of cosmic string phase of primordial cosmology. The magnetic energy of these flux quanta would correspond to dark energy and magnetic tension would give rise to negative "pressure" forcing accelerate cosmological expansion. This leads to a rather detailed vision about the evolution of stars and galaxies identified as bubbles of ordinary and dark matter inside magnetic flux tubes identifiable as dark energy.

Certain experimental findings suggest the identification  $\hbar_{eff} = n \times \hbar_{gr}$ . The large value of  $\hbar_{gr}$  can be seen as a way to reduce the string tension of fermionic strings so that gravitational (in fact all!) bound states can be described in terms of strings connecting the partonic 2-surfaces defining particles (analogous to AdS/CFT description). The values  $\hbar_{eff}/\hbar = n$  can be interpreted in terms of a hierarchy of breakings of super-conformal symmetry in which the super-conformal generators act as gauge symmetries only for a sub-algebras with conformal weights coming as multiples of  $n$ . Macroscopic quantum coherence in astrophysical scales is implied. If also Kähler-Dirac action is present, part of the interior degrees of freedom associated with the Kähler-Dirac part of conformal algebra become physical. A possible is that fermionic oscillator operators generate super-symmetries and sparticles correspond almost by definition to dark matter with  $\hbar_{eff}/\hbar = n > 1$ . One implication would be that at least part if not all gravitons would be dark and be observed only through their decays to ordinary high frequency graviton ( $E = \hbar f_{high} = \hbar_{eff} f_{low}$ ) of bunch of  $n$  low energy gravitons.

#### Hierarchy of Planck Constants from the Anomalies of Neuroscience and Biology

The quantal ELF effects of ELF em fields on vertebrate brain have been known since seventies. ELF em fields at frequencies identifiable as cyclotron frequencies in magnetic field whose intensity is about 2/5 times that of Earth for biologically important ions have physiological effects and affect also behavior. What is intriguing that the effects are found only in vertebrates (to my best knowledge). The energies for the photons of ELF em fields are extremely low - about  $10^{-10}$  times

lower than thermal energy at physiological temperatures- so that quantal effects are impossible in the framework of standard quantum theory. The values of Planck constant would be in these situations large but not gigantic.

This inspired the hypothesis that these photons correspond to so large a value of Planck constant that the energy of photons is above the thermal energy. The proposed interpretation was as dark photons and the general hypothesis was that dark matter corresponds to ordinary matter with non-standard value of Planck constant. If only particles with the same value of Planck constant can appear in the same vertex of Feynman diagram, the phases with different value of Planck constant are dark relative to each other. The phase transitions changing Planck constant can however make possible interactions between phases with different Planck constant but these interactions do not manifest themselves in particle physics. Also the interactions mediated by classical fields should be possible. Dark matter would not be so dark as we have used to believe.

The hypothesis  $h_{eff} = h_{gr}$  - at least for microscopic particles - implies that cyclotron energies of charged particles do not depend on the mass of the particle and their spectrum is thus universal although corresponding frequencies depend on mass. In bio-applications this spectrum would correspond to the energy spectrum of bio-photons assumed to result from dark photons by  $h_{eff}$  reducing phase transition and the energies of bio-photons would be in visible and UV range associated with the excitations of bio-molecules.

Also the anomalies of biology (see for instance [K63, K64, K61] ) support the view that dark matter might be a key player in living matter.

### Dark Matter as a Source of Long Ranged Weak and Color Fields

Long ranged classical electro-weak and color gauge fields are unavoidable in TGD framework. The smallness of the parity breaking effects in hadronic, nuclear, and atomic length scales does not however seem to allow long ranged electro-weak gauge fields. The problem disappears if long range classical electro-weak gauge fields are identified as space-time correlates for massless gauge fields created by dark matter. Also scaled up variants of ordinary electro-weak particle spectra are possible. The identification explains chiral selection in living matter and unbroken  $U(2)_{ew}$  invariance and free color in bio length scales become characteristics of living matter and of bio-chemistry and bio-nuclear physics.

The recent view about the solutions of Kähler- Dirac action assumes that the modes have a well-defined em charge and this implies that localization of the modes to 2-D surfaces (right-handed neutrino is an exception). Classical  $W$  boson fields vanish at these surfaces and also classical  $Z^0$  field can vanish. The latter would guarantee the absence of large parity breaking effects above intermediate boson scale scaling like  $h_{eff}$ .

### 1.1.9 Twistors in TGD and connection with Veneziano duality

The twistorialization of TGD has two aspects. The attempt to generalize twistor Grassmannian approach emerged first. It was however followed by the realization that also the twistor lift of TGD at classical space-time level is needed. It turned out that the progress in the understanding of the classical twistor lift has been much faster - probably this is due to my rather limited technical QFT skills.

#### Twistor lift at space-time level

8-dimensional generalization of ordinary twistors is highly attractive approach to TGD [K90]. The reason is that  $M^4$  and  $CP_2$  are completely exceptional in the sense that they are the only 4-D manifolds allowing twistor space with Kähler structure [A12]. The twistor space of  $M^4 \times CP_2$  is Cartesian product of those of  $M^4$  and  $CP_2$ . The obvious idea is that space-time surfaces allowing twistor structure if they are orientable are representable as surfaces in  $H$  such that the properly induced twistor structure coincides with the twistor structure defined by the induced metric.

In fact, it is enough to generalize the induction of spinor structure to that of twistor structure so that the induced twistor structure need not be identical with the ordinary twistor structure possibly assignable to the space-time surface. The induction procedure reduces to a dimensional reduction of 6-D Kähler action giving rise to 6-D surfaces having bundle structure with twistor

sphere as fiber and space-time as base. The twistor sphere of this bundle is imbedded as sphere in the product of twistor spheres of twistor spaces of  $M^4$  and  $CP_2$ .

This condition would define the dynamics, and the original conjecture was that this dynamics is equivalent with the identification of space-time surfaces as preferred extremals of Kähler action. The dynamics of space-time surfaces would be lifted to the dynamics of twistor spaces, which are sphere bundles over space-time surfaces. What is remarkable that the powerful machinery of complex analysis becomes available.

It however turned out that twistor lift of TGD is much more than a mere technical tool. First of all, the dimensionally reduction of 6-D Kähler action contained besides 4-D Kähler action also a volume term having interpretation in terms of cosmological constant. This need not bring anything new, since all known extremals of Kähler action with non-vanishing induced Kähler form are minimal surfaces. There is however a large number of embeddings of twistor sphere of space-time surface to the product of twistor spheres. Cosmological constant has spectrum and depends on length scale, and the proposal is that coupling constant reduces to that for cosmological constant playing the role of cutoff length. That cosmological constant could transform from a mere nuisance to a key element of fundamental physics was something totally new and unexpected.

1. The twistor lift of TGD at space-time level forces to replace 4-D Kähler action with 6-D dimensionally reduced Kähler action for 6-D surface in the 12-D Cartesian product of 6-D twistor spaces of  $M^4$  and  $CP_2$ . The 6-D surface has bundle structure with twistor sphere as fiber and space-time surface as base.

Twistor structure is obtained by inducing the twistor structure of 12-D twistor space using dimensional reduction. The dimensionally reduced 6-D Kähler action is sum of 4-D Kähler action and volume term having interpretation in terms of a dynamical cosmological constant depending on the size scale of space-time surface (or of causal diamond CD in zero energy ontology (ZEO)) and determined by the representation of twistor sphere of space-time surface in the Cartesian product of the twistor spheres of  $M^4$  and  $CP_2$ .

2. The preferred extremal property as a representation of quantum criticality would naturally correspond to minimal surface property meaning that the space-time surface is separately an extremal of both Kähler action and volume term almost everywhere so that there is no coupling between them. This is the case for all known extremals of Kähler action with non-vanishing induced Kähler form.

Minimal surface property could however fail at 2-D string world sheets, their boundaries and perhaps also at partonic 2-surfaces. The failure is realized in minimal sense if the 3-surface has 1-D edges/folds (strings) and 4-surface 2-D edges/folds (string world sheets) at which some partial derivatives of the embedding space coordinates are discontinuous but canonical momentum densities for the entire action are continuous.

There would be no flow of canonical momentum between interior and string world sheet and minimal surface equations would be satisfied for the string world sheet, whose 4-D counterpart in twistor bundle is determined by the analog of 4-D Kähler action. These conditions allow the transfer of canonical momenta between Kähler- and volume degrees of freedom at string world sheets. These no-flow conditions could hold true at least asymptotically (near the boundaries of CD).

$M^8 - H$  duality suggests that string world sheets (partonic 2-surfaces) correspond to images of complex 2-sub-manifolds of  $M^8$  (having tangent (normal) space which is complex 2-plane of octonionic  $M^8$ ).

3. Cosmological constant would depend on p-adic length scales and one ends up to a concrete model for the evolution of cosmological constant as a function of p-adic length scale and other number theoretic parameters (such as Planck constant as the order of Galois group): this conforms with the earlier picture.

Inflation is replaced with its TGD counterpart in which the thickening of cosmic strings to flux tubes leads to a transformation of Kähler magnetic energy to ordinary and dark matter. Since the increase of volume increases volume energy, this leads rapidly to energy minimum at some flux tube thickness. The reduction of cosmological constant by a phase transition

however leads to a new expansion phase. These jerks would replace smooth cosmic expansion of GRT. The discrete coupling constant evolution predicted by the number theoretical vision could be understood as being induced by that of cosmological constant taking the role of cutoff parameter in QFT picture [L17].

### Twistor lift at the level of scattering amplitudes and connection with Veneziano duality

The classical part of twistor lift of TGD is rather well-understood. Concerning the twistorialization at the level of scattering amplitudes the situation is much more difficult conceptually - I already mentioned my limited QFT skills.

1. From the classical picture described above it is clear that one should construct the 8-D twistorial counterpart of theory involving space-time surfaces, string world sheets and their boundaries, plus partonic 2-surfaces and that this should lead to concrete expressions for the scattering amplitudes.

The light-like boundaries of string world sheets as carriers of fermion numbers would correspond to twistors as they appear in twistor Grassmann approach and define the analog for the massless sector of string theories. The attempts to understand twistorialization have been restricted to this sector.

2. The beautiful basic prediction would be that particles massless in 8-D sense can be massive in 4-D sense. Also the infrared cutoff problematic in twistor approach emerges naturally and reduces basically to the dynamical cosmological constant provided by classical twistor lift.

One can assign 4-momentum both to the spinor harmonics of the embedding space representing ground states of super-conformal representations and to light-like boundaries of string world sheets at the orbits of partonic 2-surfaces. The two four-momenta should be identical by quantum classical correspondence: this could be seen as a concretization of Equivalence Principle. Also a connection with string model emerges.

3. As far as symmetries are considered, the picture looks rather clear. Ordinary twistor Grassmannian approach boils down to the construction of scattering amplitudes in terms of Yangian invariants for conformal group of  $M^4$ . Therefore a generalization of super-symplectic symmetries to their Yangian counterpart seems necessary. These symmetries would be gigantic but how to deduce their implications?
4. The notion of positive Grassmannian is central in the twistor approach to the scattering amplitudes in  $calN = 4$  SUSYs. TGD provides a possible generalization and number theoretic interpretation of this notion. TGD generalizes the observation that scattering amplitudes in twistor Grassmann approach correspond to representations for permutations. Since 2-vertex is the only fermionic vertex in TGD, OZI rules for fermions generalizes, and scattering amplitudes are representations for braidings.

Braid interpretation encourages the conjecture that non-planar diagrams can be reduced to ordinary ones by a procedure analogous to the construction of braid (knot) invariants by gradual un-braiding (un-knotting).

This is however not the only vision about a solution of non-planarity. Quantum criticality provides different view leading to a totally unexpected connection with string models, actually with the Veneziano duality, which was the starting point of dual resonance model in turn leading via dual resonance models to super string models.

1. Quantum criticality in TGD framework means that coupling constant evolution is discrete in the sense that coupling constants are piecewise constant functions of length scale replaced by dynamical cosmological constant. Loop corrections would vanish identically and the recursion formulas for the scattering amplitudes (allowing only planar diagrams) deduced in twistor Grassmann would involve no loop corrections. In particular, cuts would be replaced by sequences of poles mimicking them like sequences of point charge mimic line charges. In momentum discretization this picture follows automatically.

2. This would make sense in finite measurement resolution realized in number theoretical vision by number-theoretic discretization of the space-time surface (cognitive representation) as points with coordinates in the extension of rationals defining the adèle [L12]. Similar discretization would take place for momenta. Loops would vanish at the level of discretization but what would happen at the possibly existing continuum limit: does the sequence of poles integrate to cuts? Or is representation as sum of resonances something much deeper?
3. Maybe it is! The basic idea of behind the original Veneziano amplitudes (see <http://tinyurl.com/yyhwvqb>) was Veneziano duality. This 4-particle amplitude was generalized by Yoshiro Nambu, Holber-Beck Nielsen, and Leonard Susskind to N-particle amplitude (see <http://tinyurl.com/yyvkk7as>) based on string picture, and the resulting model was called dual resonance model. The model was forgotten as QCD emerged. Later came superstring models and led to M-theory. Now it has become clear that something went wrong, and it seems that one must return to the roots. Could the return to the roots mean a careful reconsideration of the dual resonance model?

4. Recall that Veneziano duality (1968) was deduced by assuming that scattering amplitude can be described as sum over s-channel resonances or t-channel Regge exchanges and Veneziano duality stated that hadronic scattering amplitudes have representation as sums over s- or t-channel resonance poles identified as excitations of strings. The sum over exchanges defined by t-channel resonances indeed reduces at larger values of  $s$  to Regge form.

The resonances had zero width, which was not consistent with unitarity. Further, there were no counterparts for the *sum* of s-, t-, and u-channel diagrams with continuous cuts in the kinematical regions encountered in QFT approach. What puts bells ringing is the u-channel diagrams would be non-planar and non-planarity is the problem of twistor Grassmann approach.

5. Veneziano duality is true only for s- and t- channels but not been s- and u-channel. Stringy description makes t-channel and s-channel pictures equivalent. Could it be that in fundamental description u-channels diagrams cannot be distinguished from s-channel diagrams or t-channel diagrams? Could the stringy representation of the scattering diagrams make u-channel twist somehow trivial if handles of string world sheet representing stringy loops in turn representing the analog of non-planarity of Feynman diagrams are absent? The permutation of external momenta for tree diagram in absence of loops in planar representation would be a twist of  $\pi$  in the representation of planar diagram as string world sheet and would not change the topology of the string world sheet and would not involve non-trivial world sheet topology.

For string world sheets loops would correspond to handles. The presence of handle would give an edge with a loop at the level of 3-surface (self energy correction in QFT). Handles are not allowed if the induced metric for the string world sheet has Minkowskian signature. If the stringy counterparts of loops are absent, also the loops in scattering amplitudes should be absent.

This argument applies only inside the Minkowskian space-time regions. If string world sheets are present also in Euclidian regions, they might have handles and loop corrections could emerge in this manner. In TGD framework strings (string world sheets) are identified to 1-D edges/folds of 3-surface at which minimal surface property and topological QFT property fails (minimal surfaces as calibrations). Could the interpretation of edge/fold as discontinuity of some partial derivatives exclude loopy edges: perhaps the branching points would be too singular?

A reduction to a sum over s-channel resonances is what the vanishing of loops would suggest. Could the presence of string world sheets make possible the vanishing of continuous cuts even at the continuum limit so that continuum cuts would emerge only in the approximation as the density of resonances is high enough?

The replacement of continuous cut with a sum of *infinitely* narrow resonances is certainly an approximation. Could it be that the stringy representation as a sum of resonances with *finite* width is an essential aspect of quantum physics allowing to get rid of infinities necessarily accompanying loops? Consider now the arguments against this idea.

1. How to get rid of the problems with unitarity caused by the zero width of resonances? Could *finite* resonance widths make unitarity possible? Ordinary twistor Grassmannian approach predicts that the virtual momenta are light-like but complex: obviously, the imaginary part of the energy in rest frame would have interpretation as resonance width.

In TGD framework this generalizes for 8-D momenta. By quantum-classical correspondence (QCC) the classical Noether charges are equal to the eigenvalues of the fermionic charges in Cartan algebra (maximal set of mutually commuting observables) and classical TGD indeed predicts complex momenta (Kähler coupling strength is naturally complex). QCC thus supports this proposal.

2. Sum over resonances/exchanges picture is in conflict with QFT picture about scattering of particles. Could *finite* resonance widths due to the complex momenta give rise to the QFT type scattering amplitudes as one develops the amplitudes in Taylor series with respect to the resonance width? Unitarity condition indeed gives the first estimate for the resonance width.

QFT amplitudes should emerge in an approximation obtained by replacing the discrete set of finite width resonances with a cut as the distance between poles is shorter than the resolution for mass squared.

In superstring models string tension has single very large value and one cannot obtain QFT type behavior at low energies (for instance, scattering amplitudes in hadronic string model are concentrated in forward direction). TGD however predicts an entire hierarchy of p-adic length scales with varying string tension. The hierarchy of mass scales corresponding roughly to the lengths and thickness of magnetic flux tubes as thickened cosmic strings and characterized by the value of cosmological constant predicted by twistor lift of TGD. Could this give rise to continuous QFT type cuts at the limit when measurement resolution cannot distinguish between resonances?

The dominating term in the sum over sums of resonances in  $t$ -channel gives near forward direction approximately the lowest mass resonance for strings with the smallest string tension. This gives the behavior  $1/(t - m_{min}^2)$ , where  $m_{min}$  corresponds to the longest mass scale involved (the largest space-time sheet involved), approximating the  $1/t$ -behavior of massless theories. This also brings in IR cutoff, the lack of which is a problem of gauge theories. This should give rise to continuous QFT type cuts at the limit when measurement resolution cannot distinguish between resonances.

## 1.2 Bird's Eye of View about the Topics of the Book "Magnetospheric Consciousness"

The basic theme of this book is the notion of magnetic body which is one of the most radical new notions of TGD inspired theory of consciousness and quantum biology.

1. The concept derives from the topological quantization of fields implying also the notion of topological light ray ("massless extremal", ME) and quantization of electric flux. The notion means that, in contrast to Maxwell's ED, TGD allows to assign to a given material system also field identity. Magnetic body as the intentional agent controlling biological body thus comes the basic hypothesis of TGD inspired quantum theory of living systems.
2. TGD Universe is fractal containing fractal copies of standard model physics at various space-time sheets and labeled by the collection of p-adic primes assignable to elementary particles and by the level of dark matter hierarchy characterized partially by the rational value of Planck constant labeling the pages of the book like structure formed by singular covering spaces of the embedding space  $M^4 \times CP_2$  glued together along a four-dimensional back. Particles at different pages are dark relative to each other since purely local interactions defined in terms of the vertices of a scattering diagram involve only particles at the same page if the the number of particles is larger than two. p-Adic length scale hypothesis and the assignment of dark matter with macroscopic quantum phases characterized by a hierarchy

of Planck constants allows to quantify the notion of magnetic body. One can identify dark magnetic flux quanta relevant to biology as 4-surfaces at pages of the book for which Planck constant is large.

3. The question about the precise form of the hierarchy of Planck constants remained open for a long time. The recent view is that all integer multiples of basic value  $\hbar_0$  are allowed. The first guess was  $\hbar_0 = \hbar$  but now it seems that  $\hbar_0$  is considerably smaller than  $\hbar$ .

There are also arguments suggesting that hierarchies involving integer multiples of some integer multiple of  $\hbar$  are realized and number theoretical vision could allow this kind of hierarchies. For instance, there are indications that Planck constants coming as  $2^{11k_d}$ -multiples of the standard Planck constant are in a special role in biology (this might relate to proton electron mass ratio and to the fact that  $2^{11} \simeq m_p/m_e$  could appear as a fundamental constant in TGD Universe, as well as to the fact that the phases  $\exp(i2\pi 2^{-k_d})$  are number theoretically simple).

4. The notion of personal magnetic body (actually onion-like fractal hierarchy of them) is essential for the TGD inspired model of living matter and predicts a hierarchy of generalized EEGs associated with the magnetic bodies and responsible for the communications from biological body or its part to the corresponding magnetic body. There is no reason to assume that only personal magnetic bodies of living systems are relevant. Rather, the view about entire magnetosphere as a conscious system controlling the behavior of biosphere emerges naturally. In this book this vision is developed.

Most of the material of this book has been written much before the dark matter revolution and formulation of the zero energy ontology and that I have only later added comments to the existing text. I hope that I can later add new material in which the implications of the dark matter hierarchy are discussed in more detail.

### 1.2.1 The organization of the book "Magnetospheric Consciousness"

The book is divided to 3 parts.

1. In the first part of the book the first chapter is devoted to the idea about a magnetosphere as a conscious system perhaps defining in some respects a fractally scaled up version of the biological body and brain. At the first look this idea sounds completely crazy but in TGD Universe p-adic fractality and the fractality associated with dark matter hierarchy make it look rather natural. Furthermore, magnetic body and electric body would be TGD counterparts for the Maxwellian fields and the explanatory power of these notions justifies their introduction. Second chapter represents a vision about the relationship between EEG and magnetosphere.
2. The second part of the book contains two chapters about the notion of semitrance. Semitrance is based on quantum entanglement of the sub-self of self, say the subsystem of the brain, with a remote system. The idea that sub-systems of two unentangled systems can entangle and in this manner give rise to a sharing and fusion of mental images (stereo vision would be the basic example) makes sense only in many-sheeted space. A rigorous justification for the sharing of mental images comes from the notion of finite measurement resolution - one of the fundamental notions of quantum TGD. The proposal is that semitrance could have been a basic control and communication tool of collective levels of consciousness during the period of human consciousness which Jaynes calls bicamerality. Schizophrenics could be seen as modern bicamerals.

The idea that human consciousness might have had totally different character for only a few millennia ago, finds additional support from the notions of super- and hyper genome implicated naturally by the dark matter hierarchy and the notion of magnetic body.

Super genome could be seen as a book having magnetic flux sheets as pages. Text lines would be defined by genomes for sequences of nuclei. This would make possible coherent gene expression at the level of organs.

The text lines of hyper genome would consist of super genomes of different organisms, not necessarily of the same species. Hyper genome would make possible coherent gene expression at the level of social group and society and give rise also to social rules. The identification of memes as hyper genes looks rather attractive. The evolution of the hyper genome could be seen as the basic driver of the explosive evolution of human civilizations during the last two millennia and would also distinguish us from our cousins.

3. The two chapters of the third part of the book entitled “Crazy Stuff” are devoted to a model of crop circles: it is left to the reader to decide whether the chapters should be taken as miserable crack-pottery, mental gymnastics with tongue in cheek, or as a fruit of a new brave vision about us and the Universe. In the first chapter it is proposed that crop circles are due to intentional action of magnetospheric higher level self or a higher level self using magnetosphere as a tool to build them.

In the second chapter two special crop circles, Chilbolton and Crabwood crop circles, are discussed in detail and the proposal that they provide information about the genomes of the life forms responsible for the crop circles. Some candidates for these life forms are discussed: the most science-fiction identification allowed by TGD would be ourselves in distant geometric future using time mirror mechanism to affect geometric past.

### 1.3 Sources

The eight online books about TGD [K96, K91, K71, K56, K17, K54, K39, K82] and nine online books about TGD inspired theory of consciousness and quantum biology [K88, K13, K60, K11, K36, K43, K47, K81, K86] are warmly recommended for the reader willing to get overall view about what is involved.

My homepage (<http://tinyurl.com/ybv8dt4n>) contains a lot of material about TGD. In particular, a TGD glossary at <http://tinyurl.com/yd6jff3o7>.

I have published articles about TGD and its applications to consciousness and living matter in *Journal of Non-Locality* (<http://tinyurl.com/ycyrxj4o> founded by Lian Sidorov and in *Prespacetime Journal* (<http://tinyurl.com/ycvktjhn>), *Journal of Consciousness Research and Exploration* (<http://tinyurl.com/yba4f672>), and *DNA Decipher Journal* (<http://tinyurl.com/y9z52khg>), all of them founded by Huping Hu. One can find the list about the articles published at <http://tinyurl.com/ybv8dt4n>. I am grateful for these far-sighted people for providing a communication channel, whose importance one cannot overestimate.

#### 1.3.1 PART I: MOTHER GAIA HYPOTHESIS IN TGD UNIVERSE

##### Magnetospheric Sensory Representations

One can imagine two basic candidates for how “our” sensory and motor control are realized: the representations at the personal magnetic sensory body and the representations on the magnetic flux tubes structures of Earth, the magnetic body of Mother Gaia. Quite a long time I saw the problem as the question “Which of these options is correct?”.

If our sensory and motor representations were realized using magnetospheric representations alone, the consciousness of astronauts would differ in a dramatic manner from the ordinary wake-up consciousness. This is not the case so that personal magnetic bodies must give the basic contribution to our personal sensory representations and motor control if the basic approach is correct. Because of the sharing of mental images also the sensory and motor areas of the magnetic Mother Gaia making possible higher collective levels of consciousness should be however important for us and perhaps responsible for memory and imagination. Therefore is of importance to try to get some idea also about the magnetospheric representations.

1. The basic element hypothesis is that some kind of resonance mechanism is involved. The simplest possibility is that projector MEs (“massless extremals topological counterparts of light rays” to the sensory canvas have length equal to the wavelength defined by the magnetic transition frequency. Also the TGD counterpart of Alfvén resonance (magnetic flux tube as string) might be involved. In the simplest situation the length of the projector ME would

be equal to the distance to the activated point of the magnetic flux tube structure involved. Also the intersections of the projector ME with magnetic flux tubes of Earth and some cavity resonance at larger space-time sheet, such as Schumann resonance, could help to amplify the signal. Representations which do not satisfy this condition could of course contribute to our consciousness but the contribution should be weak and masked by resonant contributions.

The resonance idea has gained strong support from much later developments and a concreted realization in terms of cyclotron frequencies and generalized Josephson frequencies has been proposed leading also to a concrete model for EEG as communications to the personal magnetic body.

“Personal” sensory and motor representations are realized at the personal magnetic flux tube structures by place coding: if the thickness of the magnetic flux tube increases linearly with the length coordinate of the flux tube resonance condition is satisfied all along it. A similar dependence is implied also by the homeopathic findings and by the requirement that magnetic energy density per unit length is constant.

3. Magnetospheric sensory and motor representations are realized at the magnetic body of Earth and correspond the personal consciousness of Mother Gaia. Also we can share part of her experience by fusion of the mental images. Magnetospheric representations could be responsible for the transpersonal and third person components of our consciousness, and also for memories and even imagination. The weakening of Earth’s magnetic field provides the fundamental distance coding via cyclotron frequency scale, which scales with distance as  $1/r^3$  in the dipole approximation holding for small distances but differs radically from this behavior at large distances, in particular inside magnetic tail. In magnetospheric case resonance condition gives strong conditions on the representation and can be satisfied only inside plasma sphere.
4. There seems to be no upper bound for the size of the super-conducting magnetic web providing the realization for the self hierarchy, and one can build precise quantitative models for this hierarchy. For a Buddhist this vision does not come as a surprise but challenges all cherished beliefs of brain scientist.

In this chapter this vision is developed quantitatively. The vision about magnetosphere as a living organism allows to develop the view about sensory representations to a rather detailed level. The intriguing observation that brain dynamics and iono- and magnetospheric physics seem to have common characteristic time scales, can be understood in this framework and even the mysterious 5 second time scale associated with Comorosan effect finds a possible explanation.

As I wrote the first version of the chapter I was still at temporal distance of 10 years from the ideas that TGD would give rise to a hierarchy of Planck constants defining dark matter hierarchy and that flux tubes of magnetic bodies carrying monopole flux would be also carriers of dark matter. These new ideas make the view about magnetosphere as conscious entity more precise: it is dark part of the magnetosphere which can be seen as conscious entity.

A TGD based view about magnetosphere - or rather dark part of it (!) - results as a by product and allows to topologize the phenomenological but overall important notions of magnetohydrodynamics. In magnetohydrodynamics magnetic field lines are treated as effective super-conductors: in TGD Universe magnetic flux tubes *are* super-conductors. Also Alfvén waves cease to be a phenomenological concept, and the super-conducting geodynamo model is free of the difficulties of the standard model.

### EEG and the structure of magnetosphere

Roughly 15 years ago I proposed the idea that Earth’s magnetosphere (MS) could serve as a sensory canvas in the sense that biological systems, in particular the vertebrate brain, could have sensory representations realized at the “personal” magnetic body (MB) closely associated with the MS of the Earth. EEG would make communications to and control by MB possible.

At that time I did not yet have the idea about number theoretical realization of the hierarchy of Planck constants  $h_{eff} = nh_0$  in the framework of adelic physics fusing the physics of sensory experience and cognition. This hierarchy is crucial for understanding the basic aspects

of living matter such as metabolism, coherence in long scales, correlates of cognition, and even evolution.

Also the concept of zero energy ontology (ZEO) forming now the basis of the quantum TGD was missing although there was already the about communication to past using negative energy signals. ZEO is now in a central role in the understanding of self-organization - not only the biological one. The new view about time predicting that time reversal occurs in ordinary state function reductions (SFRs) allows to understand homeostasis as self-organized quantum criticality.

For these reasons it is interesting to consider the notion of sensory canvas from the new perspective. This article discusses besides the earlier ideas about the MS also the proposal that it is possible to associate EEG bands to the regions of MS via the correspondence between EEG frequency with the distance of the region from Earth. Also the idea that the structure of MS could be a fractal analog of the vertebrate body is tested quantitatively by comparing various scales involved.

### 1.3.2 PART II: MOTHER GAIA HYPOTHESIS AND HUMAN CONSCIOUSNESS

#### Semitrance, Mental Illness, and Altered States of Consciousness

The book “The origin of consciousness in the breakdown of the bicameral mind” of Julian Jaynes provides, not only a fascinating scenario about the evolution of modern consciousness from the consciousness of bicameral stone age man, but also a holistic view about schizophrenic consciousness. In fact, Jaynes regards schizophrenic as a bicameral man receiving commands of “God” as auditory and visual hallucinations.

Jaynes sees “Gods” as the right brain of the bicameral man. In TGD framework “Gods” represent higher levels of the self-hierarchy. To put it in nutshell, TGD view about the relationship of human consciousness to higher levels of self-hierarchy relies on the notion of semi-trance. During semi-trance parts of brain entangle with some higher level, say the self associated with the social group, and are in trance and therefore unconscious. The remaining parts of brain are however conscious and receive communications from the collective consciousness via the entangled region of brain as sensory hallucinations, emotions and thoughts. Semi-trance is absolutely essential for the self-narrative: without it our consciousness would consist of memory fragments lasting only few seconds: higher level selves tell us where we come from and where we are going. Bicameral man received the commands and advices of the collective consciousness as auditory and visual hallucinations via regions of the right brain hemisphere wherefrom they were communicated to the left hemisphere whereas modern man receives these communications as thoughts (“internal speech”) in left brain semi-trance and emotions in right brain semi-trance.

According to this view, schizophrenic spends in the bicameral state larger fraction of time than normal person and receives communications of the higher levels selves more often as sensory hallucinations than as thoughts and emotions. Thus schizophrenia can be seen as cognitive and emotional abnormality and becomes illness in modern society relying crucially on cognitive and emotional self-narrative which is much more refined than the self-narrative based on sensory hallucinations. In normal consciousness left brain hemisphere inhibits the messages from right hemisphere, left and right hemispheres are totally entangled a considerable fraction of time and the entanglement with higher level selves can also involve the entanglement of entire brain leading to short periods of total trance. In this view the negative periods of schizophrenia correspond to the phases when right brain hemisphere is not entangled with higher level selves and positive, psychotic periods to the phase when this entanglement occurs often. This vision generalizes also to manic-depressive and anxiety disorders and one can see mental illness as disorder of communication between human brain and higher levels of self hierarchy.

Semi-trance mechanism provides also more detailed understanding about various altered states of consciousness and extrasensory perception (hypnotic state, telepathy, clairvoyance, some meditative states, identification experiences). Semi-trance mechanism provides considerable insights to “Stephan’s case” which originally stimulated serious attempts to understand the communications between various levels of the self hierarchy. I also apply semi-trance mechanism to model my personal altered states of consciousness.

This chapter was written roughly decade before the emergence of many key notions of

TGD now. This includes hierarchy of Planck constant defining a hierarchies of dark matter and macroscopic quantum phases, and negentropic entanglement. The notion of semitrance however make sense also in the new framework and allows formulation in terms of negentropic entanglement.

### Semitrance, Language, and Development of Civilization

The book “The origin of consciousness in the breakdown of the bicameral mind” of Jaynes provides a highly original vision about the evolution of modern consciousness from the consciousness of bicameral stone age man. TGD version about the cosmology of human consciousness relies on the notion of semi-trance. During semitrance parts brain entangle with some higher level, say the self associated with the social group, and are in trance and therefore unconscious. The remaining parts of brain are however conscious and receive communications from the collective consciousness via the entangled region of brain as sensory hallucinations, emotions and thoughts. Semitrance is absolutely essential for self narrative and establishment of long term goals: without semitrance our consciousness would consist of memory fragments lasting only few seconds. Higher level selves tell us where we come from and where we are going.

The basic differences between Jaynes’s and TGD based version about evolution of civilization relate to the interpretation of bicamerality and what really happened in the evolution of individual.

1. In TGD framework one could see bicameral man as a cognitive and emotional child characterized by the effective cognitive and emotional ages at which the cognitive and emotional self-organizations of her left brain hemisphere stopped in the absence of external stimuli necessary for self-organization (it is impossible to learn to write if civilization has not discovered written language). Of course, there are several parameters differentiating between modern man and bicameral man (sensitivity for semitrance, profile of semitrance, time fraction spent in semitrance, right-left brain inhibition,..) and the identification of bicameral as a cognitive and emotional child as we understand child is un-necessarily strong.
2. The ability to fall in semitrance was not lost during evolution but was transformed to a new form. Not only linguistic but also sensory regions of the right brain hemisphere of bicameral man entangled with higher level selves and the communications from right to left brain hemisphere were not inhibited as they are in the brain of modern man. As left brain hemisphere differentiated and memetic code gradually established itself, the guiding voice of God was transformed to internal speech and emotions. Higher level selves began to express their will via emotions, moods, planning and long term goals.
3. The differences between EEG:s of normal person and schizophrenic suggest that the fraction of time spend by average modern man in semitrance is much shorter. A more general criterion of bicamerality might be based on the fraction of time spend in semitrance state, be it sensory, cognitive or emotional. It is plausible that thoughts (not all of course!) are communicated to modern man via left brain hemisphere. If this is indeed the case, some regions of left brain hemisphere of modern man should allow standing EEG waves.

The development of the language is an absolutely essential part of the development of civilization. The syntactic structures of language emerged in parallel with the development of civilization. In TGD framework the development of language can be seen as a gradual establishment of genetic and memetic codes at new level and the emergence of symbol function. This could be also seen as an establishment of a symbiosis between two life-forms: biological life and “culture” having as a physical correlate electromagnetic life represented as topological quanta of em ELF fields and providing realization of the memetic code.

Semitrance mechanism provides an extremely general communication mechanism between the levels of the self hierarchy and could explain why ant nests, beehives, flocks of birds, packs of wolves, cell societies, nuclei of brain, etc.. can behave as single organism and still consist of apparently randomly behaving individuals. Indeed, relevant biological structures (DNA double strand, double lipid layer forming cell membrane, epithelial sheets) have binary structure analogous to two brain lobes and are ideal candidates for “bicameral” structures.

The vision about the development of civilization generalizes to cell level. p-Adic fractality plus the fact that the number of quantum jumps performed by selves is huge even at cellular

and elementary particle levels, inspires the hypothesis that various societies ranging from human civilization to cell societies and protein-DNA societies are characterized by universal asymptotic self-organization patterns. This provides important insights to the structure of the biological self-hierarchy and its relation to the structure and functioning of organism and about how semitrance might allow bio-systems to control and coordinate their behavior. Cell as a protein-DNA society together with parallel between memetic and genetic codes provides a predictive vision about how genetic code might have established itself and semitrance suggests that new kind of control and communication mechanisms based on semitrance mechanism are at work.

The vision about the development of civilization generalizes to cell level. p-Adic fractality plus the fact that the number of quantum jumps performed by selves is huge even at cellular and elementary particle levels, inspires the hypothesis that various societies ranging from human civilization to cell societies and protein-DNA societies are characterized by universal asymptotic self-organization patterns. This provides important insights to the structure of the biological self-hierarchy and its relation to the structure and functioning of organism and about how semitrance might allow bio-systems to control and coordinate their behavior. Cell as a protein-DNA society together with parallel between memetic and genetic codes provides a predictive vision about how genetic code might have established itself and semitrance suggests that new kind of control and communication mechanisms based on semitrance mechanism are at work.

While writing the first version of this chapter, I did not yet know about hierarchy of Planck constants defining dark matter hierarchy in TGD Universe, about magnetic bodies as carriers of dark matter proposed to serve as intentional agents in living matter, nor about the notion of negentropic entanglement defining physical realization of semitrance. These developments provide interesting additional ingredients to the model of semitrance.

### 1.3.3 PART III: CRAZY STUFF

#### Crop Circles and Life at Parallel Space-Time Sheets: Part I

Crop circles as a hoax is a good candidate for one of the great illusions of century created by the market economy media serving as a voice of pseudo skeptics. That this cannot be the case has been known for a long time. For instance, microwave induced explosions in growth nodes of crops are regularly involved. Also meteoric material is often associated with the crop formations but not to the region exterior to them: this is absolutely impossible if the formations were made by human artists. Routine laboratory tests allow to judge whether the formation is man-made.

Models involving plasma flows from the ionosphere to the crop field formation have been developed. The regions where the soil has a high content of calcium carbonate (chalk) helping to charge it electrically are the places where the circles appear predictably from year to year. There is also evidence suggesting that this interaction exists during the entire growth period so that there would be a continual connection to the ionosphere.

Simplest crop circles have a form similar to plasma self-organization patterns. Small plasma balls have been observed in the fields both before and after the appearance of the crop formation. There are also irregular, “non-geometric” patterns of downing which must have been created by same mechanism as crop circles involving the interaction with the ionosphere. These are ideal bits of data for developing in detail hypothesis that any living system, even plants and plant populations, has a magnetic body, and that also magnetosphere is a conscious and intelligent entity receiving information from and controlling the bio-sphere.

Dark matter hierarchy leads to a quantitative vision about how magnetic body controls biological body and receives sensory input from it, and this vision can be applied to crop circles interpreted as an outcome of generalized motor actions of magnetic body. The resulting model encourages to consider the view about crop circles as an attempt of (geo-, planeto-, helio-, or some other) magnetospheric conscious entities to tell about their existence to us.

#### Crop Circles and Life at Parallel Space-Time Sheets: Part II

There are two especially fascinating crop circle formations: Chilbolton and Crabwood. The “realistic” interpretation is of course as a clever hoax. But one also take for a moment take the role of true believer and take the formations seriously. In this mood both formations suggests very strongly the interpretation as a message from an intelligent civilization perhaps living at parallel

space-time sheets in our solar system. If one takes the fact that most of matter and energy is dark, it is not so difficult to imagine that we might not be the only intelligent creatures in the Universe, or even in solar system. One can of course take this chapter as just a play with thoughts, kind of entertainment - light-hearted outcome of theoreticians free day.

### 1. *Genetic codes of aliens*

In New Ageist mood the interpretation of the Crabwood message as a representation for the genetic codes of alien life forms is suggestive. If this interpretation is accepted, the crop circles allow to deduce a lot of information about the genetic code and other bio-codes associated with these life-forms.

1. The message suggests strongly the existence of also doublet code besides two triplet codes and this inspires a simple model for our genetic code allowing to see the code as resulting from much simpler product code by a small symmetry breaking due to the interaction between singlets and doublets. Also various alien codes results in the same manner. This has deep implications for the theories how the life at the molecular level has involved.
2. The model suggests strongly that DNA triplets have resulted as a fusion of DNA singlets and doublets defining simpler genetic codes. My bio-chemical knowledge does not allow to test this hypothesis. It turns out that one can deduce surprisingly detailed information about the alien genetic codes. In fact, almost unique codes result if one accepts the proposed model of the genetic code having symmetries obeyed also by our genetic code.
3. The Chilbolton message tells that also silicon is of fundamental importance for this life-form at DNA level. Crabwood message contains a variant of genetic code for which the simplest interpretation is that DNA doublets of form  $XA$  are effectively doubled: perhaps doublets of form  $XA_S$  besides  $XA$ , where  $A_S$  denotes a compound of A and silicon, have emerged. This increases the number of DNA triplets from 64 to 80 and thus also the information content of the genetic code. Same could have occurred to one member of the 7-plet composing aminoacids and increased the number of amino-acid like molecules by three: this in turn would increase the expressive power of the genetic code. The difference between man and ape is enormous although genetic codes are almost identical. It is impossible to even imagine the level of intelligence of these creatures as compared to that of us. The silicon insertions to the DNA and amino-acids bring in mind symbiosis with a silicon-based nano-computers.
4. Chilbolton message contains two different DNA strands. This could have several interpretations. DNA could indeed be asymmetric. Alternatively, there could be two genetic codes for the same life-form: the 80 DNA-23 amino-acid code would involve silicon and could perhaps give rise to a living arithmetic processor. The third option is that there are two separate life-forms involved. 64-DNA code would be associated with the plasmoidic life-forms. The fact that the Sun, whose convective zone contains a magnetic field of order Tesla making it an ideal environment for this life-form, is described to be smaller than in Arcibo message, suggests that this life-form populates also solar magnetosphere. The plasmoidic life-forms could serve as kind of less intelligent medium like messengers, quantum entanglers, making possible a telepathic sharing of mental images between members of different civilizations. The light balls observed near crop formations would represent this life-form. Also UFOs could be identified as plasmoidic life-forms inducing telepathic encounters with the alien life-forms. The biology of the more intelligent life-form would be based on 80 DNA-23 amino acid code, which could live even outside the solar system.

The very general symmetries deduced from our own genetic code fix the identification of the alien codes highly uniquely. All these codes result by the same universal mechanism, and are characterized by the same imbedding of the aminoacid space to the DNA space implying that a considerable part of the code is universal. The symmetries are the exact A-G permutation symmetry and the almost exact T-C permutation symmetry for the last base of the DNA triplet, and the approximate decomposition to a product of codes associated with DNA doublets (the first two bases of triplet) and singlets (the third base of triplet). The success of this model inspires the view that molecular life first evolved to form DNA singlets and doublets coding for 2-plet

*resp.* 10-plet of “pre-aminoacids”. After that DNA doublets and singlets fused to triplets coding for the ordinary aminoacids, which are perhaps an outcome from the fusion of the two kinds of “pre-aminoacids”.  $2 \times 10$  dichotomy might relate to the hydrophilic-hydrophobic dichotomy for the aminoacids.

*2. Where do the messages arrive from?*

The messages responsible for the crop circles should come from our solar system, perhaps from terrestrial magnetosphere or solar magnetosphere. Time mirror mechanism allows to consider also the possibility (suggested by the time interval of year and one day between the messages) that the messages arrive from a distant geometric future and tell about the genetic codes of future civilizations living in the solar system.

*3. Where do the life forms assignable to the genetic codes live?*

One can consider several identifications of the biological life forms assignable to the codes using Chilton message as a hint. These life forms could live in Earth, Mars, Jupiter, perhaps as intra-planetary, say intra-terrestrials at various boundaries such as mantle-core and core-inner core boundary. Even the photosphere of Sun could be populated.

The notions inspired by the dark matter hierarchy, in particular the notion of  $N$ -molecule, allow to consider seriously the existence of biological life forms able to cope in high temperature environments, and one can build rough view about what high- $T$  life should look like. The experimental signature of  $N$ -molecules are spectral lines of corresponding ordinary molecules in environments where they are not thermally stable. In the solar photosphere the spectral lines of water and solid calcium ferrite have been indeed observed. Without exaggerating one can say that the systematic search of these spectral lines might revolutionize our world view.

To sum up, the proposed model for crop circles can be taken as a joke, or as an intellectual entertainment analogous to solving crossword puzzle. It is however amusing that the proposal inspired by the model suggesting the existence of large underground seas has been found to be true!

Part I

**MOTHER GAIA HYPOTHESIS  
IN TGD UNIVERSE**

## Chapter 2

# Magnetospheric Sensory Representations

### 2.1 Introduction

The general view about sensory and motor representations has been rather heuristic hitherto. By some additional thought one can however build a more detailed picture about sensory and motor representations.

#### 2.1.1 Are Sensory Representations At The Personal Magnetic Body Or At The Magnetic Body Of The Earth's Magnetic Field?

One can imagine two basic candidates for how *our* sensory and motor control are realized: the representations at the personal magnetic sensory body and the representations on the magnetic flux tube structures of Earth, the magnetic body of Mother Gaia. Quite a long time I saw the problem as the question “Which of these options is correct?”.

If our sensory and motor representations were realized using magnetospheric representations alone, the consciousness of astronauts would differ in a dramatic way from the ordinary wake-up consciousness. This is not the case so that personal magnetic bodies must give the basic contribution to our personal sensory representations and motor control if the basic approach is correct. Because of the sharing of mental images also the sensory and motor areas of the magnetic Mother Gaia making possible higher collective levels of consciousness are however important for us and are perhaps partially responsible for memory and imagination and third person aspect of our consciousness. Therefore it is of importance to try to define and understand also the magnetospheric representations.

1. The basic hypothesis is that some kind of resonance mechanism is involved. The simplest possibility is that projector MEs (“massless extremals”, topological counterparts of light rays) to the sensory canvas have length equal to the wavelength defined by the magnetic transition frequency. Also the TGD counterpart of Alfvén resonance (magnetic flux tube as string) might be involved. In the simplest situation the length of the projector ME would be equal to the distance to the activated point of the magnetic flux tube structure involved. Also the intersections of the projector ME with magnetic flux tubes of Earth and some cavity resonance at larger space-time sheet, such as Schumann resonance, could help to amplify the signal. Representations which do not satisfy this condition could of course contribute to our consciousness but the contribution should be weak and masked by resonant contributions.
2. What might be called personal sensory and motor representations are realized at the personal magnetic flux tube structures by place coding: if the transversal area of the magnetic flux tube increases linearly with the length coordinate of the flux tube, the resonance condition is satisfied all along it. A similar dependence is implied also by the homeopathic findings [I11] discussed in [K38] and by the requirement that magnetic energy density per unit length is constant.

3. Magnetospheric sensory and motor representations are realized at the magnetic body of Earth and correspond to the personal consciousness of Mother Gaia. Also we can share part of her experience by fusion of the mental images and magnetospheric representations could be responsible for the transpersonal and third person components of our consciousness, and also involved with our memories and imagination. The weakening of Earth's magnetic field provides the fundamental distance coding via cyclotron frequency scale, which scales with distance as  $1/r^3$  in the dipole approximation holding for small distances but differs radically from this behavior at large distances, in particular inside magnetic tail. In the magnetospheric case resonance condition gives strong conditions on the representation.
4. There seems to be no upper bound for the size of the super-conducting magnetic web providing the realization for the self hierarchy and one can build precise quantitative models for this hierarchy. For Buddhist this vision does not come as a surprise but challenges the cherished beliefs of brain scientist.

### 2.1.2 The Relationship Between Earth's Magnetic Field And Personal Magnetic Body

A dramatic clarification to the relationship between personal magnetic body and Earth's magnetic field came through a rather frustrating experience. For years I erratically believed that the magnitude of the magnetic field assignable to the biological body is  $B_E = .5$  Gauss, the nominal value of the Earth's magnetic field. Probably I had made the calculational error at very early stage when taking  $Ca^{++}$  cyclotron frequency as a standard. I am grateful for Bulgarian physicist Rossen Kolarov for pointing to me that the precise magnitude of the magnetic field implying the observed 15 Hz cyclotron frequency for  $Ca^{++}$  is .2 Gauss and thus slightly smaller than the minimum value .3 Gauss of  $B_E$ . This value must be assigned to the magnetic body carrying dark matter rather than to the flux quanta of the Earth's magnetic field. This field value corresponds roughly to the magnitude of  $B_E$  at distance  $1.4R$ ,  $R$  the radius of Earth.

The understanding of the dark matter hierarchy leads to a detailed quantitative view about quantum biology with several testable predictions [K30]. The applications to living matter suggests that the basic hierarchy corresponds to a hierarchy of Planck constants coming as  $\hbar(k) = \lambda^k(p)\hbar_0$ ,  $\lambda \simeq 2^{11}$  for  $p = 2^{127-1}$ ,  $k = 0, 1, 2, \dots$  [K30]. Also integer valued sub-harmonics and integer valued sub-harmonics of  $\lambda$  might be possible. Each p-adic length scale corresponds to this kind of hierarchy.

Number theoretical arguments suggest a general formula for the allowed values of  $\lambda$  [K32] as  $\lambda = n$  where  $n$  characterizes the quantum phase  $q = \exp(i\pi/n)$  characterizing Jones inclusion [K97]. The values of  $n$  for which quantum phase is expressible in terms of squared roots are number theoretically preferred and correspond to integers  $n$  expressible as  $n = 2^k \prod_n F_{s_n}$ , where  $F_s = 2^{2^s} + 1$  is Fermat prime and each of them can appear only once.  $n = 2^{11}$  obviously satisfies this condition. The lowest Fermat primes are  $F_0 = 3, F_1 = 5, F_2 = 17$ . The prediction is that also n-multiples of p-adic length scales are possible as preferred length scales. The unit of magnetic flux scales up as  $h_0 \rightarrow h = nh_0$  in the transition increasing Planck constant: this is achieved by scalings  $L(k) \rightarrow nL(k)$  and  $B \rightarrow B/n$ .

$B = .2$  Gauss would corresponds to a flux tube radius  $L = \sqrt{5/2} \times L(169) \simeq 1.58L(169)$ , which does not correspond to any p-adic length scale as such.  $k = 168 = 2^3 \times 3 \times 7$  with  $n = 5$  would predict the field strength correctly as  $B_{end} = 2B_E/5$  and predict the radius of the flux tube to be  $r = 18 \mu\text{m}$ , size of a large neuron. However,  $k = 169$  with flux  $2h_5$  would be must more attractive option since it would give a direct connection with Earth's magnetic field. Furthermore, the model for EEG forces to assume that also a field  $B_{end}/2$  must be assumed and this gives the minimal flux  $h_5$ . Note that  $n = 5$  is the minimal value of  $n$  making possible universal topological quantum computation with Beraha number  $B_n = 4\cos^2(\pi/n)$  equal to Golden Mean [K4].

This picture inspires several questions. Is the Earth's magnetic field at  $k = 169$  flux sheets accompanied by  $n = 5$  dark variant at which macroscopic quantum phases responsible for many properties of living matter reside. How strongly the behavior of  $B_{end}$  correlates with that of  $B_E$ ? For instance, do perturbations of  $B_E$  induce those of  $B_{end}$  and is the average ratio  $B_{end}/B_E$  constant? Unfortunately, I did not have a slightest idea about these questions when I wrote the

first version of this chapter and the implications of the new view about  $B_{end}$  and its relationship to  $B_E$  are not discussed in the sequel.

### 2.1.3 Topics Of The Chapter

In this chapter the transpersonal, magnetospheric sensory and motor representations are the principal objects of interest.

1. The basic vision inspired by fractality of consciousness is that the entire solar system is a gigantic magnetic organism having planetary magnetospheres as sub-organisms. Magnetospheres represent collective levels of consciousness and receive sensory input from biosphere and perform also very high level bio-control. Like brain, also magnetosphere decomposes to two kinds of regions. Relatively stable regions are optimal for the sensory representations. Unstable and self-organizing transition regions are optimal for imagination and for a generalized motor control in the planetary scale. Motor control could mean higher control at biochemistry level but also social behavior could reflect the presence of this kind of control since we are in a well defined sense cells (or perhaps neurons) of the magnetic Mother Gaia.
2. The structure of the magnetosphere predicts a hierarchy of magnetospheric selves bringing in mind the chakra hierarchy of Eastern philosophies of consciousness. This hierarchy has counterpart at the level of brain and corresponds to the 5-levelled hierarchy of cortex plus midbrain and brain stem.
3. The resonance condition  $f_m = c/L$  relating magnetic frequency to the length of the projector ME, is very natural for the magnetospheric sensory representations. The condition can be satisfied only within the plasma sphere and for EEG frequencies above 8.6 Hz. Also cavity resonances associated with various space-time sheets (inner core of Earth, the cavity below ionosphere, magnetosphere,...) could give could be behind resonance frequencies. The predictions are consistent with the basic facts about EEG.
4. The mysterious  $\tau_C = 5$  second time scale associated with the Comorosan effect (the enhancing effect of the laser light irradiation on the catalyst activity when irradiation time is a multiple of 5 seconds) corresponds to several magnetic transition frequencies in  $\sim 10$  nT magnetic field prevailing at plasma sheet. This kind of magnetic field is created also by magnetic particles in lungs. This inspires the speculation that very high level electromagnetic bio-control from, say plasma sheet and magnetic lobes is present.

A TGD based view about magnetosphere results as a by product and allows to topologize the phenomenological but overall important notions of magnetohydrodynamics. In magnetohydrodynamics magnetic field lines are treated as effective super-conductors: in TGD framework magnetic field lines are replaced by magnetic flux tubes which could be genuine super-conductors (here the value of Planck constant is expected to play the key role). Also Alfvén waves cease to be a phenomenological concept, and the super-conducting geodynamo model is free of the difficulties of the standard model.

What makes the proposed speculative picture so fascinating is its generality. Even meteors have magnetospheres so that the generation of conscious life would be completely universal phenomenon unavoidable for any magnetized objects in the vicinity of any star producing ionic wind! The crucial prediction is that magnetospheres are living, self-organizing systems. There is indeed empirical support for this prediction.

The appendix of the book gives a summary about basic concepts of TGD with illustrations. Pdf representation of same files serving as a kind of glossary can be found at <http://tgdtheory.fi/tgdglossary.pdf> [L2].

## 2.2 The Structure Of Magnetic Field Of Earth And Variation Of Cyclotron Frequency Scales

It is interesting to try to relate the model for sensory representations to the structure of Earth's magnetosphere. To achieve this, I will provide a brief novice's overview about the structure of

magnetosphere. I will use partially TGD based language in which magnetic field lines are replaced by magnetic flux tubes and the formation of the plasma corresponds to the leakage of the supra currents from the magnetic flux tubes. I will also briefly consider TGD based qualitative models for the phenomena, many of which are not well understood in Maxwellian theory. Examples of such phenomena are Alfvén waves which are not proven to result from Maxwellian theory, and magnetic dynamo of Earth whose working mechanism is not really understood. Also the mechanism of auroras becomes very concrete when field lines are replaced with flux tubes [K15].

### 2.2.1 Magnetosphere

Solar wind [F4, F22, F21] determines the large scale structure of the magnetic field of Earth to a high extent. The basic structural components are transition regions and regions between them.

1. At the bow shock the solar wind arriving at a supersonic velocity of 500 km/s encounters Earth's magnetic field and is transformed to a subsonic flow and dissipates energy inside magnetosheath where the plasma is denser and hotter than in the solar wind. The distance of the bow shock is roughly 12-14  $R$  ( $R$  denotes Earth's radius).
2. The shocked solar wind cannot penetrate Earth's magnetic field and a cavity called magnetosphere is formed. Interplanetary magnetic field and magnetosphere is separated by a transition region called magneto-pause, which is accompanied by a plasma mantle. At the day side magneto-pause is at distance of about 10  $R$  but when solar wind is particularly strong it can move down to 6-7  $R$ . At the night side magnetosphere is stretched into long cylindrical magneto-tail of length about 1000  $R$  and radius about 20  $R$ .

Magnetosphere consists of clearly separated regions with widely different densities and temperatures. The main division is into inner and outer magnetosphere. In the inner magnetosphere magnetic field lines are co-rotating with the Earth: in the outer magnetosphere they are stationary. Magneto-pause contains an ionic current determined by the discontinuity of the magnetic field and orthogonal to it.

#### Magnetic lobes

The outer magnetosphere at the night side, magneto-tail, consist of northern and southern magnetic lobes which are cavities having very low ionic density of about .01 ions per cubic cm. The low density can be understood as resulting from the absence of the solar wind in this region. By Maxwell's equations magnetic field is approximately constant in the region where the flow lines are parallel (if sources can be neglected). According to [F3] the value of the magnetic field is about 30 nT in the interior of the lobes. The relatively strong magnetic field inside lobes serves as a magnetic energy battery feeding energy to the plasma sheet.

Magneto-tail is a cylindrical structure with radius of order  $R_m = 20R$ . Magnetic lobes extend up to  $r \sim 1000R$ . The magnetic field lines remain actually closed. In TGD framework this means the existence of a closed supra-current circuitry formed by the magnetic flux tubes.

#### Plasma sheet and magneto-pauses

Magnetic lobes are separated by a plasma sheet in the equatorial plane consisting of hot ( $5 \times 10^6$  K), low density plasma (.3-.5 ions/cm<sup>3</sup> as opposed to .01 ions/cm<sup>3</sup> inside lobes) with magnetic field  $\sim 10$  nT. Plasma sheet extends from 8 $R$  to about 60 $R$  and has thickness of order few  $R$ , and gets thinner with increasing distance. Plasma sheet disappears at so called neutral point, where magnetic field vanishes. In the plasma sheet the magnetic flux from southern lobe flows to the northern lobe. Near the Earth plasma sheet reaches the high latitude auroral ionosphere. The value of the magnetic field immediately above the magnetic sheet is 20 nT.

In TGD framework the plasma sheet can be seen as resulting from the leakage of the supra currents from the magnetic flux tubes of Earth's magnetic field to a larger space-time sheet. This supra-current leakage is caused by the inertia of the ions and electrons in the region where the magnetic flux tubes are highly curved. The leakage occurs also in the magneto-pause, where the tangential component of the magnetic field is discontinuous and a surface current orthogonal to  $B$

generating the discontinuity flows. In the magneto-pause the magnetic flux tubes of the inner and outer region are parallel. The reconnection of the parallel flux tubes of the magnetic fields of Earth and Sun allows the transfer of the ions of the solar wind to the magnetosphere. Magneto-pause is accompanied by a plasma mantle, which could be partially due to the leakage of ions to larger space-time sheet accompanying the reconnection process.

There is a convective flow of ions towards the plasma sphere along the plasma sheet. In TGD framework this motion must take place at a larger space-time sheet or involve a hopping between magnetic flux tubes: in both cases a breaking of super-conductivity is implied.

Plasma sheet has also a boundary layer in which the tangential component of the magnetic field is discontinuous. This requires a surface current orthogonal to the axis of the sheet. This current results when the ions from the magnetic flux tubes leak out from flux tubes to a larger space-time sheet by their inertia in the highly curved portion of the flux tube caused by the tangential discontinuity.

### **Cusps**

Southern and northern cusps are funnel-shaped regions which on the day side consist of closed highly compressed flux tubes of dipole field and on the night side of almost open flux tubes stretched deep into the magnetospheric tail. In this funnel magnetic field is orthogonal to the magneto-pause and the magnetic flux tubes of the solar magnetic field can penetrate the magnetosphere. This implies that solar plasma contained in the solar magnetic field lines penetrates deeply into the magneto-tail by reconnecting with the field lines of Earth's magnetic field near poles. This gives rise to auroras [F23].

Reconnection can be seen as resulting from the penetration of the solar magnetic flux tubes at the upper boundary of the magneto-pause along the plasma sheet to a highly stretched flux tubes along the boundary of the plasma sheet. The transformation to open flux tubes can happen only if the solar flux tubes reconnect with the flux tubes of the solar magnetic field penetrated into the plasma sphere. Thus auroras can be seen as a phenomenon involved with the boundary between plasma sheet and lobes.

Cusps, and to some extent also plasma mantle, serve as a channel along which the solar wind feeds "magnetometabolic" energy to the magnetosphere needed to run the geodynamo system [F1] (the notion of super-conducting geodynamo will be introduced later). The dipole field generated solely by the convective currents in Earth interior would die out in few thousands of years. The field inside lobes serves as a storage of magnetic energy and is recharged by the energy of the solar ions leaking into the magnetic tail in the reconnection process. One could see the cusps also as a communication channel between solar and Earth's magnetic structures, kind of magnetic "ears" of magnetic Mother Gaia.

### **Inner magnetosphere**

Inner magnetosphere is a toruslike structure whose extension varies between 4R (day side) and 8R (night side). In the inner magnetosphere the typical density is about 1 ion per cubic centimeter. Inner magnetosphere is bounded by a transition layer of thickness of  $\sim R$  (magneto-pause). In this region the density of the ions drops rapidly.

Inner magnetosphere contains plasma sphere whose radius varies in the range 2R-4R at day side and 2R-6R at night side. Plasma has an ionospheric origin. The density of the cold plasma consisting mainly of protons ( $T \sim 1$  eV) sphere varies in the range  $10 - 10^3$  ions/cm<sup>3</sup>, whereas the temperature is  $\sim 5 \times 10^3$  K. The cold, dense plasma of plasma sphere is frozen around magnetic flux lines which co-rotate with Earth. In TGD framework this means that flux tubes co-rotate and thus change shape. In the equatorial plane the density of the plasma sphere drops sharply down to  $\sim 1$  ion/cm<sup>3</sup> at  $r = 4R$ . This transition region is known as a plasma pause. During magnetic storms the outer radius decreases since the pressure of the solar wind compresses the plasma sphere. The day-night variation of the shape of the plasma sphere is rather small. Within this region the magnetic field has in a reasonable approximation dipole shape with radiation belts forming an exception.

## Radiation belts and ring currents

Plasma sphere contains the inner and outer van Allen radiation belts [F2] (extending from  $2R$  to  $4R$  at the day side and from  $2R$  to  $9R$  at the night side). Both the inner and outer belts extend up to latitude of 60 degrees. The boundaries of the belts follow magnetic field lines except in at the Northern and Southern tips. This region contains ring currents.

One of the functions of the radiation belts is to prevent the penetration of the biologically harmful high energy cosmic rays to the ionosphere. In fact, the inner protonic belt results by the decay of the cosmic ray neutrons to protons. Second function (in TGD universe!) is to act as a part of a controlled dynamo system giving rise to the magnetosphere of Earth (for the standard theory of geodynamo see [F1]).

It has been found that the energies of the ions in the radiation belts are much higher than one might expect [F5]. This might be understood if part of the ions runs as supra currents along the magnetic flux tubes. Super-conductivity is broken only by the leakage of the supra currents from the magnetic flux tubes. This could explain the success of magnetohydrodynamics based on the assumption of effective super conductivity.

### 1. Inner radiation belts

There are actually two separate inner radiation belts: the one containing protons and the one containing electrons. Protons in the inner belt have energies in 10-100 MeV range and readily penetrate space crafts. The inner radiation belts are concentrated around equator in the range  $(1.1 - 3.3)R$  (these numbers depend on the conventions used and should not be taken too literally). In the protonic belt the maximum of the flux density is at  $2R$ : in electronic belt the maximum flux density is at about  $1.4R$ . The inner belts are relatively stable and there is no night-day difference. The inner belts feel magnetic storms and vary with the 11 year period of solar activity.

What is interesting is that the inner belts are also sensitive to human technology. The inner belt has lowered above the East Coast of US from 300 km to 10 km [J3]: this process is associated with power transmission along magnetic field line and the usage of the ionosphere-resonance frequency 60 Hz as the frequency of household current.

During the last decade two new belts have formed inside inner belts [F4], [J3]. The new electronic belt has maximum electron flux at  $r \sim 2R$  (earlier flux maximum was at  $r \sim 1.4R$ ). The second newcomer consists mostly of  $O^+$  ions but containing also  $He^+$ . This process has been seen as a part of magnetic re-self-organization process occurring in the scale of the entire helio-magnetosphere implying rapid changes of planetary magnetospheres [J3].

### 2. Outer radiation belt

Outer belt contains mainly electrons with energies up to 10 MeV and is produced by the injection of charged particles during geomagnetic storms. This makes outer belt much more dynamical than the inner one. The cross section of the outer radiation belt is banana shaped. The outer belt ranges from  $3R$  to  $6R$  (at night side). The maximum for the density of electrons above MeV energy occurs at  $4R$ .

### 3. Ring currents

Radiation belts contain ring currents. Electronic ring current rotates in the same direction as Earth whereas protonic current runs to the opposite direction. In the outer belt only electronic current is present. Quiet time ring current in the inner electronic *resp.* protonic belts consists mainly of hydrogen ions *resp.* electrons but during magnetic storms also  $O^+$  ions are present (note however the presence of the new  $O^+$  belt). Ring current has the effect that magnetic field gets stronger at the outer side of given belt and weaker at the inner side.

## Super-conducting geodynamo?

The standard theory for Earth's magnetic field assumes that the convective currents in the liquid outer core of Earth generate the magnetic field [F1]. It has been found that also planets which do not possess liquid core can have magnetic field: this means a failure of the standard geodynamo theory. Furthermore, planetary magnetospheres have very similar structure [F17], and solar magnetosphere has "memory" [E6]. This suggests that magnetospheres are self-organizing systems having only few asymptotic patterns. There is evidence that the changes of Earth's magnetic field

can be quite too fast (several degrees per day!) to be caused by convective currents in the outer liquid core [F10]. Also the different orientations of the magnetic and rotational axis is not what one would make as the first guess. This forces to think that standard dynamo theory might be somehow wrong.

The vision about solar and planetary magnetospheres as self-organizing systems inspires the idea that the rotational electric field and ring currents could be an essential part of the dynamo system generating, and perhaps even controlling, Earth's magnetic field. Solar wind would provide the energy needed for this purpose. This vision gets support from the findings of the last decades about dramatic changes in the magnetospheres of some planets [J3] (auroras in Saturn, polar shifts of Uranus and Neptune, the doubling of the field intensity of Jupiter, rapid pole shifts of the geomagnetic field suggesting the possibility of a geomagnetic field inversion in progress, significant growth of the recognized geomagnetic anomalies). That solar magnetic activity has been also especially strong during this time supports the view that solar wind controls these events to some extent.

1. *Super-conducting geodynamo model*

The notion of many-sheeted space-time (see **Fig.** <http://tgdtheory.fi/appfigures/manysheeted.jpg> or **Fig.** 9 in the appendix of this book) leads to a modification of the dynamo theory.

1. The simplest TGD based model for a rotating astrophysical object predicts dynamo system replacing black hole type solutions with singularity free space-time surfaces [K93]. The basic characteristic of the models is the presence of the orthogonal magnetic and electric fields (this follows from the assumption that  $CP_2$  projection of the space-time surface is 2-dimensional).
2. The fields in question can be either magnetic or  $Z^0$  magnetic. In the TGD framework ring currents consist of the ions "dropped" from the magnetic flux tubes to a larger space-time sheet. The dropped ions drift in an electric field whose field lines circle around the axis of the magnetic field. Ring currents generate a weak magnetic field in a direction orthogonal to the plane of the ring currents. This field, if sufficiently strong, could serve as a seed inducing a spontaneous magnetization inside Earth's outer or inner core. In standard physics this is not possible since Earth's core is very hot so that conductive currents as a source of the magnetic field are the only possibility.
3. In TGD the situation is different. The interior of Earth contains besides atomic space-time sheet also super-conducting space-time sheets at very low temperature. In particular, the flux tubes of the magnetic fields generated by the ring currents are present. Since the temperature is extremely low, electrons could bind to Cooper pairs with net spin  $J = 2$  (ions would possess relative angular momentum) as in high  $T_c$  super-conductors [K14, K15]. Bosonic ions could form Bose-Einstein condensates. Exchange interaction favors magnetization parallel to the seed field. This generates additional magnetic field in the direction of the magnetic field inside flux tubes and leads to spontaneous magnetization and the amplification of the seed field. The same trick could be applied also by living organisms to achieve magnetic homeostasis.
4. The energy needed to maintain the magnetic field would be much smaller than in the conventional dynamo model since dissipative effects are small. The direction of the magnetic field could also vary rapidly for the same reason. To some degree the direction of the magnetic field could be controlled by the solar wind since it affects ring currents. An interesting question is whether the solar wind could feed electrons to the Earth's interior: first to the magnetic flux tubes of Earth's magnetic field in a reconnection process, and then to Earth's core along flux tubes in the outer radiation belt dipping near to the polar caps.
5. Only the magnetic flux tube structure containing the super-conducting matter rotates around the magnetic axis. The small amount of super-conducting matter means that the change of the direction for the magnetic field does not require huge energy and angular momentum transfers. The rotation axis of the space-time sheet representing entire Earth could be different. There could be similar dynamo also at this larger space-time sheet. In the simplest model this dynamo would be  $Z^0$ -magnetic.

6. The mechanism inducing the reversals of the magnetic field is at the topological level the same as in the standard model of geodynamo (for an early TGD inspired model of the solar sunspot cycle see [K80] ). Magnetic flux tubes get strongly entangled during differential rotation and sooner or later this leads to a reconnection process. Super-conductivity makes possible very rapid reversals.
7. What distinguishes TGD model from geodynamo model is that the super-conducting magnetic flux tubes are the primary dynamical system rather than the convective currents. This allows to view the anomalies of the geomagnetic field as additional magnetic flux tube bundles (there are four anomalous regions: Canadian, East Siberian, Brazilian, and Antarctic) having some role in the control of the magnetodynamics. For instance, the feed of super-conducting electronic or ionic Cooper pairs to the Earth interior would allow to intensify magnetization inside flux tubes. Self-organization would explain why the magnetic field patterns are similar for all planets possessing a detectable magnetic field. Self-organization would also explain the “memory” of the solar magnetic field [E6].

### 2. Dark matter as a hierarchy of phases with large values of Planck constant

In the original model it was assumed that space-time sheets carrying various Bose-Einstein condensates are at a very low temperature so that cyclotron energy scale is above thermal energy and spontaneous magnetization as a source of magnetic field becomes possible instead of electric currents.

The hypothesis that dark matter corresponds to a hierarchy of phases with a large value of Planck constant [K32] brings a new element to the model since magnetic interaction energies scale as  $\hbar$  and for large enough value of  $\hbar$  can be above thermal threshold. Also dissipation rates are expected to behave like  $1/\hbar$  and would thus be very small for large values of Planck constant.

Therefore macroscopically quantum coherent dark matter can generate spontaneous magnetization even of magnetic flux sheets are at the same temperature as the visible matter. The TGD inspired model of [J9] [K30] relies on a hierarchy for favored values of Planck constant given by  $\hbar(k) = \lambda^k \hbar_0$ ,  $\lambda = 2^{11}$ .  $\lambda = 2^{11}$  corresponds to a fundamental constant in TGD Universe [K80]. For  $k \geq 4$  cyclotron energy for ions is above the thermal threshold at room temperature. For electrons this is true already for  $k \geq 3$ . At least the values of  $k$  satisfying  $k \leq 7$  are favored by the model for EEG predicting a fractal hierarchy of EEGs.

### 3. Application to planetary magnetospheres

Consider now how the proposed model survives qualitative tests.

1. Five planets (Earth, Jupiter, Saturn, Neptune, and Uranus) have detectable magnetic fields. The rings of Saturn are an excellent candidate for the seed of the magnetic field. Also Jupiter has a dense ring of condensed plasma rotating at its radiation belts.
2. Mercury is smallest of the terrestrial planets and rotates slowly (rotation period is 58.6 days) but has weak magnetic field contrary to what the standard dynamo theory predicts [F17]. Mercury is also the planet nearest to the sun and solar wind is strong at this distance. This could mean that the ring currents are sufficiently intense to generate the critical seed field inducing the spontaneous magnetization.
3. Mars has extremely weak magnetic field. Magnetic field is crucial for life in TGD framework and there is evidence that Mars has possessed life in past. It would be interesting to find whether Mars has had magnetic field in the past. Earth’s magnetic field should vanish during two millenia if it continues to decay with the recent rate. Those who like doomsday scenarios could of course wonder whether the life in Earth might suffer the Martian fate and how much time our species still has?
4. Also Venus has very tiny magnetic field. It has almost same radius as Earth and is also hot. The rotation period is however very long (243 days) and in the standard model this is taken as an explanation for the smallness of the magnetic field. In TGD framework one must assume that the rotation velocities of the ions of the ring currents are proportional to the rotation velocity implying that the seed magnetic field is below the critical value.

### Magnetic transition frequencies in magnetic lobes and plasma sheet

The values of important magnetic transitions frequencies in various regions of the magnetosphere are crucial if one wants to construct a general vision about sensory and motor representations at the magnetic sensory canvas. In the inner magnetosphere dipole approximation allows to estimate the spatial dependence magnetic transition frequencies.

In magnetosheath and magnetolobes the average values of the magnetic field are 10 nT and 30 nT respectively. Immediately above the magnetosheath the value of the magnetic field is 20 nT. Magnetosheath could thus allow place coding by the magnetic transition frequency scale whereas magnetolobes are not taylor made for this purpose. Note that the thickness of the magnetic flux tubes in the field of 10 nT =  $2^{-9}B_e$ ,  $B_e = 5 \times 10^4$  nT is from the quantization of magnetic flux equal to about 55  $\mu\text{m}$  and thus corresponds to a biological length scale. This length scale corresponds to the p-adic length scale  $L(11, 16)$  ( $L_p(n) = p^{(n-1)/2}L_p$ ). Already this encourages to think that plasma sheet might be involved with bio-control.

The strength of the interplanetary magnetic field depends on the intensity of solar wind and varies between .2 – 80 nT and has average of 6 nT. Interestingly, the maximum value 80 nT corresponds to the p-adic length scale  $L(173) = 20 \mu\text{m}$ .

#### 1. Proton

In the case of proton there are three especially interesting frequencies to be considered: cyclotron frequency  $f_c = eB/2\pi m_p$ , spin flip frequency and the frequency of combined spin flip and  $\Delta n = 1$  transitions. The frequencies of these transitions in magnetic field of  $.5 \times 10^{-4}$  T are  $f_c = 300$  Hz,  $f_{flip} = 838$  Hz,  $f_1 = 532$  Hz and  $f_2 = 1138$  Hz. In a field of 10 nT the values of the transition periods  $T = 1/f$  are  $T_c = 16.7$  sec,  $T_{flip} = 6$  sec,  $\tau_1 = 9.3$  sec, and  $\tau_2 = 4.4$  sec. For a field of 30 nT the values are obtained by dividing by three. Plasma sheet contains also  $He^{++}$  and  $He^+$  ions and for these the cyclotron times are  $2\tau$  and  $4\tau$ . For  $O^+$  ion which is also present cyclotron time varies between 1 min 20 s and 4 minutes. All these time scales are typical time scales of human consciousness. For the interplanetary magnetic field protonic cyclotron times are 13.9 min, 27.8 sec, and 2.1 sec for the minimum, average, and maximum respectively.

#### 2. Electron

For electrons the cyclotron frequency is 282 Hz for 10 nT so that electronic cyclotron transitions cannot represent ionic cyclotron transitions in brain (if they occur at the flux tubes of Earth's magnetic field!). Spin flip combined with cyclotron transition represents however an important exception. In this case the non-vanishing transition frequency is due to the anomalous magnetic moment of electron and the frequency in the reference field of  $.5 \times 10^{-4}$  T is 2255 Hz. This gives  $T(e) = 2.24$  sec. Note that also  $n = 3$  protonic cyclotron transition gives rise to nearly the same period.

It is interesting to notice that these time scales are important time scales of human consciousness and that both protonic spin flip time scale and  $T(e)$  nearly half of the 5 second time scale associated with the Comorosan effect [I40, I13] discussed in [K99]. If Earth's magnetic field is accompanied by dark flux sheets in entire magnetosphere carrying field  $B_{end} = 2B_E/5$ , then the value of  $T(e)$  would become  $T(e) = 5$  seconds for  $B_E = 11.2$  nT.

To sum up:

1. the average magnetic field in plasma sheet corresponds to a definite p-adic length scale;
2. the mysterious time scale of the Comorosan effect pops up as a basic magnetic transition time in magnetic lobes and plasma sheet and is related to bio-control by enhancing catalytic rates: it is however essential that the “dark” counterpart  $B_{end} = 2B_E/5$  of  $B_E$  associated with living matter is in question;
3. plasma sheet is found to be a complex self-organizing system with the velocity distribution of ions representing complex features (such as “eyes” and “wings” !) [F11].

These findings force to seriously consider the possibility that plasma sheet and magnetopause and perhaps even magnetic lobes might perform high level bio-control utilizing MEs and supra-currents along magnetic flux tubes forming the extension of the endogenous magnetic circulation to the entire magnetosphere.

### 2.2.2 $Z^0$ Magnetosphere

Classical  $Z^0$  fields are in a key role in TGD based model of living matter and chiral selection in the living matter is one of the anomalous phenomena explained by the presence of classical  $Z^0$  fields. Therefore one expects that also  $Z^0$  magnetosphere of Earth is crucial for the realization of sensory representations and/or of motor control.

#### Clarification of basic notions

The original erratic view was that it is possible to speak about space-time sheets carrying only em or  $Z^0$  fields: hence the term of  $Z^0$  magnetosphere. The notion of induced gauge field combined with field equations however predicts strong constraints between various classical fields and it is not possible to have a situation in which either em -,  $Z^0$  -, or gluon field alone would be present as a classical field. Hence it is quite possible that same space-time sheets define both magnetosphere,  $Z^0$  magnetosphere, and color magnetosphere.

For instance, for vacuum extremals with vanishing induced Kähler form classical em field  $\gamma$  and  $Z^0$  field satisfy

$$\gamma = -\frac{\sin^2(\theta_W)}{2} Z^0 \simeq -\frac{Z^0}{8}$$

for  $\sin^2(\theta_W) = .23$ . Note that classical  $\gamma$  and  $Z^0$  fields are defined by vector potentials defined as  $eA_{em}$  and  $g_Z A_Z$ . For space-time sheets for which  $CP_2$  projection is  $r = \infty$  homologically non-trivial geodesic sphere of  $CP_2$  (see the appendix of the book) one has

$$\gamma = \left(\frac{3}{4} - \frac{\sin^2(\theta_W)}{2}\right) Z^0 \simeq \frac{5}{8} Z^0 .$$

The induced  $W$  fields vanish in this case and they vanish also for all geodesic sphere obtained by  $SU(3)$  rotation. For homologically trivial geodesic sphere a standard representative is obtained by using for the phase angles of standard complex  $CP_2$  coordinates constant values. In this case induced em,  $Z^0$ , and Kähler fields vanish but induced  $W$  fields are non-vanishing. One can say that for non-vacuum extremals with 2-D  $CP_2$  projection color rotations and weak symmetries commute. Note that neutral and  $W$  MEs play a key role in the TGD based model of living systems.

What is true that ordinary particles at space-time sheets behave as if they had vanishing weak charges with respect to long range gauge fields. TGD however predicts an entire hierarchy of scaled up variants of standard model physics for which particles have scaled down mass spectrum. Also dark matter hierarchy is predicted: in this case masses remain invariant in the scaling  $\hbar \rightarrow \lambda\hbar$ , with  $\lambda \simeq 2^{11}$  in the physically most interesting situation, but Compton lengths and time and thus sizes of particle space-time sheets are scaled up since they are proportional to  $\hbar$ . This makes possible macroscopic quantum phases with light particles carrying weak and color charges. Even ordinary nuclei can carry anomalous weak and thus also em charges. It seems that these exotic weak and em charges could be central for the proper understanding of even ordinary condensed matter physics and in living matter this exotic new physics would be of crucial importance.

#### $Z^0$ magnetic field of Earth

Consider first  $Z^0$  magnetic field accompanying the Earth's magnetic field.

1. If non-vacuum extremals with 2-D  $CP_2$  projection are involved the  $Z^0$  field strength satisfies

$$g_Z B_Z = \frac{1}{\frac{3}{4} - \frac{\sin^2(\theta_W)}{2}} eB \simeq \frac{8}{5} \times eB .$$

For  $B =_B E$   $Z^0$  magnetic cyclotron frequency scale would be nearly the same as the magnetic one with alpha band map scaled to  $\sim 16$  Hz so that the cyclotron spectrum of exotically ionized nuclei would be in EEG range.

In this case the question arises, whether em or  $Z^0$  flux quantization fixes the area of flux tubes. For a rational value of  $\sin^2(\theta_W)$  it is possible to satisfy both flux quantization conditions if the integers characterizing the flux quanta satisfy

$$\frac{n_\gamma}{n_Z} = \frac{Z_\gamma}{Z_Z} \times \left( \frac{3}{4} - \frac{\sin^2(\theta_W)}{2} \right) .$$

2. If vacuum extremals with 2-D  $CP_2$  projection or small perturbations of them are in question the  $Z^0$  field strength satisfies

$$g_Z B_Z = -\frac{2}{\sin^2(\theta_W)} \times eB \simeq 8 \times eB ,$$

so that  $Z^0$  magnetic field would dominate and one might think that  $Z^0$  magnetic flux tubes corresponds to almost vacuum extremals. Also in this case both flux quantization conditions can be applied.

An interesting question is whether the  $Z^0$  magnetic field forced by the  $CP_2$  geometry alone should have as its source rotating exotic particles carrying  $Z^0$  charge. Exotically ionized nuclei are a natural candidate in this respect.

Symmetry considerations favor the assumption that the overall topology of  $Z^0$  magnetic field is essentially the same as that of magnetic field. If some fraction of atomic nuclei are  $Z^0$  ions they can create  $Z^0$  magnetic field, and it is plausible that Earth's  $Z^0$  magnetic field receives a large contribution from the rotational motion of these nuclei so that the  $Z^0$ -magnetic axis would most naturally be the same as the rotation axis of Earth and not same as the axis of magnetic field so that different space-time sheets would be in question.  $L(k = 173)$  next to  $L(169)$  associated with the Earth's magnetic field is the first guess for the p-adic length scale characterized  $Z^0$  magnetic field of Earth. If almost vacuum extremals are in question,  $Z^0$  cyclotron frequency scale is by a factor  $2/16\sin^2(\theta_W) \simeq 1/2$  smaller than the magnetic one.

### Are $Z^0$ magnetic van Allen belts there?

The symmetry between magnetism and  $Z^0$  magnetism would suggest that the  $Z^0$  counterparts of van Allen belts and ring currents are also there and form a controlling part of the  $Z^0$  superconducting dynamo generating Earth's  $Z^0$  magnetic field. Exotically ionize ordinary ions and atoms would contribute to the  $Z^0$  ring currents.  $^4He$  ions are abundant in solar wind and exotically ionized  $^4He$  nuclei are of special interest. In particular, tetra-neutron [C2, C1] could be interpreted as an exotically ionized  $He_4^{2+}$  nucleus carrying two units of  $Z^0$  and em charge in  $d\bar{u}$  type color bonds between nucleons [K83]. The lifetime of tetra-neutron is about  $10^{-7}$  seconds. A continual ionization of  $^4He$  nuclei by dark  $W$  MEs would make possible for tetra-neutrons to serve as a source of dark  $Z^0$  magnetic field. The interaction with biosphere could be responsible for the ionization if ring current flows along space-time sheet serving as a magnetic body controlling biosphere.

Also dark variants of elementary particles carrying weak charges could contribute to the ring current. Note that the protonic radiation belt is believed to result through the decay of highly energetic cosmic ray neutrons to protons. Also Sun should have both magnetic and  $Z^0$  magnetic belts controlling to some extent the solar  $Z^0$  magnetic dynamo. As already noticed, the TGD based model for rotating astrophysical objects automatically predicts dynamolike structures. Planetary orbits could carry the ring currents controlling solar magnetic and  $Z^0$  magnetic fields and thus providing a feedback mechanism. Indeed, in the model of the tritium beta decay anomaly one is forced to assume that also Earth's orbit is surrounded by a dark neutrino belt [K83].

### 2.2.3 Observations Making Bells Ringing

Below I summarize some findings which turned out to be very useful in the attempts to understand whether and how magnetosphere could be a self-organizing living system possibly performing also bio-control.

#### Magnetospheres as self-organizing systems

The view that magnetospheres are self-organizing systems is supported by the observations accumulated about the magnetic self-organization of the solar system during last decades reviewed

in [J3]. According to this report we are living a period of transition basically due to a penetration of highly charged material from the interstellar space into the interplanetary space from an interstellar plasma structure containing various kinds of magnetic structures.

This energy feed is inducing various kinds of processes affecting not only the atmo-, iono-, and magnetospheres of Earth but also solar and other planetary magnetospheres. Also interplanetary transmitting properties are affected. The Schumacher-Levy comet, which for few years ago collided with Jupiter and among other things a induced plasmoid train and had dramatic effects on Jupiter's magnetosphere, is referred to as a "Comet" SL-9 in [J3]. I am not sure whether "Comet" was meant to suggest that SL-9 was actually a plasma magnetic structure from the interstellar space. There is also evidence that we are moving to a similar temperature instability that occurred for 10.000 years ago and which might have initiated the development of the bicameral society in turn leading to the modern society much later.

This process could be also seen as a re-self-organization and evolution of consciousness in solar length scale as a reaction to the encounter of heliospheric and interstellar magnetic intelligences. The penetration of interstellar plasmoid like structures to the interplanetary space through the solar magneto-pause could be interpreted as a failure of the magneto-immune system of the heliomagnetosphere. The interaction of the planetary magnetospheres with these intelligent (benevolent?) plasmoid like structures would in turn induce the re-self-organization. Needless to say, the interaction of the two intelligences might have far-reaching consequences for the evolution of the ordinary life.

### Connection with the Comorosan effect

Comorosan effect means that the irradiation of living manner by visible light over a period which is a multiple of  $\tau_C = 5$  seconds implies enhanced catalytic activity [I40, I13]. According to private communication, this effect is not restricted to living or even organic matter. TGD explains the effect [K99] but the deeper explanation of the time scale of  $\tau_C = 5$  seconds has remained a longstanding challenge.

The 5 second time scale associated with Comorosan effect is the spin flip time scale associated with proton's  $\Delta n = 1$  cyclotron transition in the field of  $B_{end} = 13.32$  nT (which could correspond to the value of  $B_E = 5B_{end}/2 = 33.3$  nT in magnetic lobes).  $\tau_C$  is also associated with proton's  $\Delta n = 3$  cyclotron transition and the electronic cyclotron spin flip in the field of  $B_{end} = 2/5B_E = 11.2$  nT (plasma sheet).

Lungs contain magnetic particles giving rise to  $\sim 10$  nT magnetic field and thus for  $B_{end} = 2B_E/5$  to  $n = 3$  protonic cyclotron transitions and electronic cyclotron spin flips in 5.5 second scale, which is very near to  $\tau_C$ . Perhaps Comorosan effect is used by the outer magnetosphere to affect the behavior of living matter and lungs are involved with this process.

### Plasma sheet as a "microchip"

Plasma sheet should be a seat for magnetospheric sensory representations in theta and delta bands and among other things provide a model of magnetospheric self. If plasma sheet has this kind of role, it should manifest itself in its properties. Plasma sheet should be self-organizing, complex structure rather than system near thermal equilibrium. Plasma sheet is also expected to perform bio-control.

There is a fascinating finding about the "memory chip" character of the organization of the ionic velocity distribution in the plasma sheet [F11]. The belief was that the distribution is a Maxwellian thermal distribution but an complex organization of the number of ions as a function of speed and direction relative to the direction of the local magnetic field has been detected [F11]. By coloring the bins representing small volumes of the velocity space, one finds that 3-dimensional features like "eyes" and "wings" appear! The proposed interpretation is that these features codes the history of ionic currents. One cannot exclude the possibility that these ionic currents could reflect even our sensory experiences. The prediction is that also other transition regions (in particular magneto-pause) should exhibit similar complex self-organization patterns. The simplest possibility is that the velocity patterns of ordinary electrons reflect the underlying pattern of dark matter at the dark magnetic flux tubes forming perhaps some kind of sensory representations.

## 2.3 General Assumptions About Sensory And Motor Representations

If one believes that magnetosphere is a living organism, the first thing one can do to concretize this belief, is an attempt to generalize the general wisdom about living organisms in the biosphere to the new context. Thus the notions of metabolism, sensory representations, and motor control should have magnetospheric counterparts. This might provide also new views about the physics of magnetosphere. The physics of magnetosphere could also allow to develop new ideas about TGD inspired quantum biology. The fact that also endogenous magnetic fields are of crucial importance for the understanding of ordinary life in TGD framework, means that the basic distinctions might be due to difference between scales.

### 2.3.1 Magnetosphere As A Living Organism

Consider now the analogy between biological organisms and magnetosphere in more detail.

1. In the living matter magnetic flux tubes and corresponding supra currents define what might be called magnetic circulation, kind of analog of the blood circulation, along which information and energy is carried by the supra currents. At the quantum level the spatial variation of the phase of the complex order parameter is a correlate for the supra current and the net phase changes around closed loops (say loop around leg) coming as multiples of  $2\pi$  characterize these currents. One of the earliest TGD inspired ideas about bio-systems was that these almost topological quantum numbers are ideal for the representation of biologically relevant information. Phenomena supporting strongly the existence of this kind of topological quantum numbers are known [A3].

Also in the case of magnetosphere similar magnetic circulation should be present and the phase increments around closed loops should represent “magnetobiological” information. For instance, supra currents could circulate around the plasma sheet and magneto-pause. Since plasma sheet is a self-organizing structure with very complex fractal structure, huge amounts of magnetobiological information could be stored to these supra currents.

2. Magneto-pause would be kind of a magnetic skin insulating the magnetic organism from the interplanetary magnetic field supra currents. Perhaps a similar insulation occurs also in the skin of the biological organisms and prevents the penetration of harmful magnetic fields to the organism. This would mean the flow of supra currents along skin. Typically the current would rotate around, say, leg and there is indeed evidence for the selection rules implied by the topological quantum numbers associated with these kind of supra currents [A3]. The recombination of the flux tubes of solar magnetic field with those of Earth at the magneto-pause could give rise to a “sensory input” from the magnetic skin: certainly solar supra currents carry a lot of negentropy. Polar cusps and caps would play the role of the parts of body which feed in the metabolic input and feed out the metabolic waste.
3. Magnetic Mother Gaia has besides magnetic skin also a material skin, biosphere. Individual organisms would act as sensory receptors. The notion of magnetospheric tactile senses mapping entire biosphere to the magnetosphere seems very natural in the conceptual framework of TGD inspired theory of consciousness.

### 2.3.2 Magnetospheric Nervous System

One could also try to find whether the magnetospheric counterpart of the nervous system might make sense. Of course, one must be very cautious in making this kind of associations. The first thing to notice is that nervous system corresponds to the self-organizing and strongly dissipating parts of organism. In magnetosphere the plasma rich regions certainly satisfy this criterion. The most one can hope is that there is direct mapping between brain structures and magnetosphere such that dominating EEG MEs in brain area project to the corresponding regions of the magnetosphere and define magnetospheric sensory representations there.

1. One function of the nervous system is to build a sensory map of the material world. Thus also the magnetospheric nervous system should process “sensory” information about biosphere. This fixes naturally the order of the hierarchical structure: the larger the distance from Earth’s center, the higher the hierarchy level. This also conforms with the fact that lower frequencies must correspond to the higher levels of self hierarchy.
2. The interpretation for the magnetosphere would be as brains of Mother Gaia receiving sensory input from biosphere with various organisms serving as sensory receptors. Outer magnetosphere would correspond to the highest and most abstract level of information processing contributing also to the brain consciousness via the sharing of mental images. Corresponding magnetic time scales indeed correspond to brain time scales. Self-organization is maximal inside magneto-pause and plasma sheets. Perhaps the identification as the counterpart of the cortex for either or both of these structures is appropriate. Magnetic lobes, analogous to the brain cavities, certainly serve as stores of magnetic energy. The low density of ions and approximate spatial constancy of the magnetic field means that magnetic lobes are not tailor made for the sensory representations. Day and night sides of the magnetosphere are good candidates for the magnetospheric counterparts of posterior (hind brain) and anterior (frontal lobes) parts of the cortex. It will be found that resonant magnetospheric sensory representations come in two basic types depending on whether the projector MEs from brain project to the same or the opposite side of the globe: the asymmetries between these representations resemble the asymmetries between left and right brain.
3. One can continue with the structural analogies. The inner magnetosphere could correspond to the subcortical regions. The scales for the magnetic transition frequencies suggest that protonic inner belts would perhaps be the counterparts of thalamus and hippocampus: representation of our long term memories could be in question. Electronic inner belt might correspond to cerebellum characterized by higher EEG frequencies. The outer electronic belt could correspond to basal ganglia and limbic brains (note the toruslike topology) and be involved with our imagination and planning of motor actions and also with speech production. Ionosphere, where also the representations based on heavier ions are possible, would correspond to brain stem, spinal chord, and the neuronal level. p-Adic length scale hypothesis and  $v = Lf$  scaling law [K66] give a rather precise meaning for this correspondence.

Individual organisms could be seen as sensory receptors of Mother Gaia and would be accompanied by their personal sensory magnetic canvases for which magnetic field strengths could be much weaker, and perhaps directed along the direction of the local magnetic field and penetrating to the interplanetary space. The simplest assumption is that the projector MEs to the personal magnetic canvas intersect the flux tubes of Earth’s magnetic field and in this manner generate magnetospheric sensory representations which might serve as memory representations.

The analogy with nervous system suggests that there is two-directional information transfer between magnetosphere and ordinary living organisms. Magnetospheric sensory representations and magnetospheric “motor control” would correspond to this bi-directional information transfer.

### 2.3.3 Magnetospheric Metabolism

Living systems are self-organizing systems in which highly negentropic energy flow enters the system, delivers its negentropy, and leaves the system. Usually only the negentropy of the solar radiation is considered as important. If magnetosphere is a living organism, also the negentropy feed by the ionic supra-currents flowing along the magnetic flux tubes of the solar magnetic field should play a key role.

Plants get their ordered energy directly from solar radiation via photosynthesis. Magnetosphere would in turn receive its energy and negentropy by breathing solar wind. The flow of ordered energy would enter via the polar cusps and magneto-pause via the leakage of the magnetic flux tubes of solar magnetic field to the magnetic lobes followed by a recombination with the flux tubes of Earth’s magnetic field. Magnetic lobes might be seen as reservoirs of magnetic energy and information resulting from the “sensory” input from solar wind and from Earth.

Magnetic storms transfer this energy along the plasma sheet down to radiation belts during magnetic storms and sub-storms. The incoming ionic flux should flow out back to the interplanetary

space somewhere. A good guess is that inertia forces the leakage of the supra current to a larger space-time sheet at the highly curved tips of the outer radiation belts dipped towards the polar caps, and the ions leak out to the interplanetary space along larger space-time sheet as Ohmic currents. The radiation observed instrumentally at the polar caps could result in this process. The energy vacuum zero point energy liberated in the process is about  $E_0 = \pi^2/md^2$ , where  $d$  is the thickness of the magnetic flux tube determined by the flux quantization. This corresponds to energy of about  $2 \times 10^{-9}$  eV which is very small as compared to the energy of the ion.

The energy feed is utilized to pay the energy bills of the dissipative ionic flow along the plasma sheet towards radiation belts and of the dissipative ring currents participating to the control of Earth's magnetic field by super-conducting dynamo mechanism. Also the ionic current flowing along circular flux tubes of the magneto-pause needed to build the magnetic field inside magneto-tail uses the energy of the solar wind. These circulating currents could be supra currents flowing along magnetic flux tubes which correspond to some other, presumably longer p-adic length scale so that the magnetic field would be weaker.

### 2.3.4 General Ideas About Sensory Representations

Consider first what the minimal assumptions relating to the sensory representations might be.

#### Two basic types of representations

The crucial assumption is that neither ionosphere nor Earth's surface can serve as a Faraday cage for the MEs nor for the magnetic flux tubes possibly involved. This is as it should be if the notion of many-sheeted space-time concept makes sense. If this assumption fails, a person in Faraday cage would lose most of the contents of consciousness. This prediction is testable and there are claims that the ELF radiation in alpha band can penetrate Faraday cage (the work of Dr. Andre Puharich): unfortunately, it is not clear to me whether these stories are only modern city folklore or not.

##### 1. Personal representations

The magnetic body consisting of vertical magnetic flux tubes associated with brain and body could serve as a personal magnetic sensory and motor canvas. Since the flux tubes of Earth's magnetic field emerge from the surface of Earth almost vertically, vertical flux tube structures could emerge as structures locally parallel to local Earth's magnetic field from the brain and body. These structures cannot however coincide with the field structures or Earth and flux tubes carrying magnetic field much weaker than Earth's magnetic field could be involved. For instance, eye contains static field of about 10 pT and the magnetic particles of lungs give rise to magnetic fields of order 10 nT. Also brain contains magnetic particles and they presumably give rise to net static magnetic field besides taking care that sensory projectors are oriented parallel to magnetic field and thus define a fixed coordinate frame for the sensory representations.

Ordinary magnetic fields with these typical intensities could be accompanied by dark magnetic fields satisfying  $B_{end} = 2B/5$  and corresponding to  $n = 5$  length of dark matter having flux tube radii scaled up by factor  $n = 5$  and perhaps making possible topological quantum computation in some sense [K4].

The transversal surface area (thickness) of the magnetic flux tube would code for the distance of the perceptive field or, more generally, some geometric property of a feature. The magnetic structures associated with pyramidal cells and red blood cells could anchor the coordinate frame for the sensory representations to the coordinate frame defined by the directions of Earth's magnetic and gravitational fields. Somehow the orientation of the ME projectors must be anchored to this frame and vertical flux tube structures might allow to achieve this anchoring. The cellular magnetic dipoles should be parallel to the local Earth's magnetic field which suggests that vertical magnetic fields might have different origin.

##### 2. Magnetospheric representations

Is the notion of personal magnetic sensory canvas necessary? One could consider also the possibility that everything is represented on the flux tubes structures of Earth's magnetic (and  $Z^0$  magnetic) field.

1. If only the magnetic flux tube structures are used so that sensory representations mean sharing of the brainy mental image with the mental image of Mother Gaia about position, one ends up with problems relating to space traveller consciousness. For instance, the nearby magnetic field around the moon traveller should differ dramatically from that at the surface of Earth so that contents of consciousness should change dramatically. This is not the case. Thus it seems that personal sensory magnetic canvas is there and codes at least for the sensory experience. Magnetic Mother Gaia could however contribute to various third person aspects of consciousness and also to memory.
2. TGD based explanation of near death experiences supports the notion of magnetic body remaining after the “physical death” and this body could correspond to the vertical magnetic flux tube structure or part of the magnetospheric sensory canvas.
3. Vertical magnetic flux tubes would also make possible a direct interaction between brain and Earth’s magnetic field. Sharing and fusion of our mental images and the mental images of Mother Gaia becomes possible. In particular, supra currents could flow between magnetic sensory canvas of Mother Gaia and brain and allow the control of organisms.

Thus it would seem that it is best to be as general as possible. Personal magnetic canvases should be there but also Mother Gaia is interested about what happens in our brain and contributes to our consciousness by the sharing of mental images.

### Place coding

Place coding is one of the key ideas of TGD based theory of sensory and motor representations. Place coding relies on the observation that the local strength of the magnetic field determines which em frequency induces magnetic transitions of the super-conducting particles residing at a given distance along the magnetic flux tube having a varying thickness. Therefore it becomes possible to code geometric information to frequency and translate it to a distance along the magnetic flux tube. Thus the requirement that endogenous frequency equals to the magnetic transition frequency determines a two-dimensional surface of the magnetosphere and in the case of personal sensory canvas point of the magnetic flux tube.

Endogenous cyclotron frequency  $f_c$  corresponds to ME with length which is multiple of the minimal length  $L = c/f_c$ ,  $f_c = qB/2\pi m$ , where  $q$  and  $m$  are the charge and mass of the charge carrier. If this length equals to the distance from brain to the point of the sensory canvas, ME acts as a waveguide amplifying the signal. This condition is very stringent and in the case of magnetosphere allows only one-dimensional curves as its solution. In the case of the personal sensory canvas  $S \propto L$  condition for the transversal area  $S$  of the magnetic flux tube as function of its length  $L$  guarantees resonance condition. In the case of magnetic mirrors, a further amplification results from the TGD counterparts of Alfvén waves representing oscillations of the magnetic flux tube and satisfying the dispersion relation  $f_n = nc/2L$ .

One must however notice the possibility that ME (and corresponding parallel magnetic flux tube in the case of a magnetic mirror) only intersects Earth’s magnetic flux tube rather than ending to it. In the case of ULF frequencies associated as magnetic transition frequencies with the magnetic lobes carrying very weak magnetic fields one must indeed assume that MEs can be much longer than the distance from Earth to the activated point of the sensory canvas. Meteor sounds provide support for the existence for MEs having length  $\lambda = c/f$ ,  $f \sim 40$  Hz.

#### 1. Place coding for features inside brain

The presence of endogenous magnetic fields giving rise to a magnetic circulation analogous to blood circulation is assumed. The strength of the endogenous magnetic field must be near to that of Earth’s magnetic field. Endogenous place coding of the features by magnetic flux tube thickness is assumed and there is evidence for this [J29]. The genetically coded magnetic crystals inside pyramidal neurons and haemoglobin molecules could serve as sources of magnetic fields. If endogenous magnetic fields result from the self-organization of Earth’s magnetic field, one can understand why the flux quanta of the complex endogenous magnetic fields have approximately the same thickness as those of Earth’s magnetic field.

#### 2. Place coding at the personal magnetic sensory canvas

The simplest hypothesis is that personal magnetic canvas consists of a magnetic flux tube bundle defining an almost vertical cone and that each straight flux tube is accompanied by a parallel ME. This structure will be referred to as magnetic mirror with the understanding that the ends of ME intersecting the magnetic flux tube define the mirrors. A ME of length  $L$  acts naturally as a wave guide amplifying frequencies, which come as harmonics of the fundamental frequency  $f = c/L$  (whether also  $f = c/2L$  might be considered: this depends on the boundary conditions).

ME could intersect the flux tube at any point of the tube. Alfvén waves [F19] correspond in TGD framework to oscillations of magnetic flux tubes and have spectrum  $f_n = nc/2L$  for fluxtube length  $L$ . More general types of Alfvén waves result if the magnetic flux tube has some kind discontinuity or sharp gradient in which Alfvén waves are reflected. The intersection of ME with flux tube (this is the optimal situation) or a highly curved portion of the magnetic flux tube could serve as this kind of discontinuity. Alfvén waves or reflected Alfvén waves can resonantly amplify the wave propagating inside ME.

Since magnetic flux is quantized, the average intensity of the magnetic field inside the flux tube is proportional to its transverse area  $S$ . Place coding by magnetic transition frequencies is achieved if the transverse area  $S$  of the flux tube is proportional to the distance  $L$  along the tube:  $S \propto L$ . This law can obviously hold true only above some threshold distance  $L_{min}$ . An explicit form of the resonance condition reads as

$$\begin{aligned} f &= \frac{c}{L} = f_m = \frac{keB}{m} = f_m^{max} \frac{S_{min}}{S} , \\ f_m^{max} &= \frac{keB_{max}}{m} . \end{aligned} \quad (2.3.1)$$

Here  $k$  is a numerical constant characterizing the particular magnetic transition frequency and  $f_m^{max}$  is the maximum value of the endogenous frequency and  $S_{min}$  corresponding flux tube thickness. This implies

$$L = \frac{c}{f_m^{max}} \frac{S}{S_e} = \frac{m}{keB_{max}} \frac{S}{S_{min}} . \quad (2.3.2)$$

For  $L > L_{min}$  the surface of the flux tube is paraboloid. Note that there is separate flux tube for each kind of magnetic transition frequency, in particular for each ion. Harmonics of a given cyclotron frequency can be however coded by the harmonics of the fundamental frequency ME.

Certain findings about the imprinting of water frequencies [I11] can be understood if the endogenous magnetic flux tubes satisfy the  $L \propto S$  law [K38]. Among other things this law also implies that the energy density of the magnetic field per unit length is constant: this is very natural in equilibrium situation.

MEs need not be straight cylinder like structures: the general solution ansatz allows also curved MEs but it is not clear whether any curved magnetic flux tube could form a magnetic mirror with a parallel ME. The magnetic flux tubes associated with the personal magnetic canvas need not be (only) those of Earth's magnetic field and the entire p-adic length scale hierarchy might be involved. For instance, the static magnetic field associated with eye is about 10 pT and corresponds to electronic cyclotron period about 8.87 seconds. If head is accompanied by a magnetic flux tube of thickness of order 8 cm, flux quantization implies that the corresponding electronic cyclotron time is of order 30 minutes.

### 3. Place coding for magnetospheric representations

In the case of magnetospheric representations analogous place coding can be assumed for the distances of the objects of the perceptive field and translates the distance to a cyclotron frequency scale defined by Earth's magnetic field. The thickness for the magnetic flux tube of Earth's magnetic field, varying as  $(r/R)^{3/2}$  in dipole approximation, provides the place coding for the distance of an object of perceptive field. EEG ME with ionic cyclotron frequency generates cyclotron transition at the magnetic flux tube of Earth and is assumed to create sensory self representing experienced position ("feeling of existence") entangled with various sub-selves of brain representing "features". This can be also interpreted as a sharing and fusion of mental images: one of them possessed by the "magnetic Mother Gaia" and the second one by the organism.

In the simplest model EEG MEs generate magnetic transitions at magnetic flux tubes amplified to quantum phase transitions at and in this manner give rise to the sensory and other representations.

#### 4. How projector EEG MEs are generated?

EEG MEs are generated by the dropping of ions from the atomic (or some larger) space-time sheets to the magnetic flux tubes of endogenous magnetic fields having roughly the same strength as Earth's magnetic field. The dropping ion enters into a cyclotron state with a high value of magnetic quantum number  $n$ , and this state decays by emitting ELF radiation at multiples of the cyclotron frequency. These ELF photons or ELF em fields in turn can induce magnetic transitions at the magnetic flux tubes of the appropriate magnetic structure.

In many-sheeted space-time particles topologically condense at all space-time sheets having projection to given region of space-time so that this option makes sense only near the boundaries of space-time sheet of a given system. Also p-adic phase transition increasing the size of the space-time sheet could take place and the liberated energy would correspond to the reduction of zero point kinetic energy. Particles could be transferred from a portion of magnetic flux tube portion to another one with different value of magnetic field and possibly also of Planck constant  $h_{eff}$  so that cyclotron energy would be liberated.

This mechanism or some of its alternatives need not be realized only at the level of brain. Also the plasma rich transition regions of the magnetosphere having interpretation as magnetospheric counterparts of brain structures could communicate with other similar regions by the same mechanism. What is needed is that the plasma ions return to high  $n$  cyclotron state at the magnetic flux tube, which then decays by emitting cyclotron radiation having MEs are topological correlate. Magneto-pause, plasma sheet, the transition region between inner and outer magnetospheres, and radiation belts are especially natural candidates for regions communicating in this manner.

### Hierarchy and modularity of representations

An entire hierarchy of sensory representations is predicted. Scaling law states that there is a mapping of brainy p-adic length scales  $L$  to much longer p-adic length scales  $L_{EEG} = \lambda_{EEG} = (c/v) \times L$ , where  $v$  is the typical conduction velocity for nerve pulses [K66]. The interpretation is that there is a physical mechanism transforming of EEG frequencies to much higher endogenous frequencies

$$f_h = c/L = (c/v)f_{EEG} \quad , \quad (2.3.3)$$

and vice versa [K41].

Quantum entanglement between different levels of the hierarchy makes possible modularity. The features assigned by quantum entanglement to a given point of the sensory canvas at given level can be representations realized at some lower level canvas. For instance, simple geometric features like triangles and circles could be represented at lower level canvas and associated with a point of higher level sensory canvas by quantum entanglement.

Similar hierarchical structure and modularity is expected to hold true for the representations at the magnetospheric sensory canvas. This applies also to the motor representations. This means modulation hierarchy. The lower level in the hierarchy adds kind of a ripple to the long wave length representation at the higher level. This applies also in the temporal domain. Thus rough control commands from higher level are gradually detailed at the lower levels (motor action as carving of 4-dimensional statue by adding gradually increasingly finer details).

### Also $Z^0$ magnetospheric representations could be there

$Z^0$  magnetic fields are crucial in the model of hearing and the memetic code believed to be behind the spoken language [K65]. Cognitive neutrinos pairs could provide one realization of the memetic code [K65]. Most importantly, classical  $Z^0$  force could be strong in the biologically most relevant length scales. Indeed, the p-adically scaled up electronic Compton scales corresponding to  $k = 151, 157, 163, 167$  are in the range 10-2500 nm. These primes correspond to Gaussian Mersennes  $(1+i)^k - 1$  and are excellent candidates for defining p-adic lengths scales associated with scaled

down fractal copies of standard model physics. The reason is that the known smaller Mersennes and Gaussian Mersennes correspond to physically important length scales in the hitherto studied energy range (below TeV energies).

The work of Shnoll [E7], [E7] demonstrates a correlation between fluctuations of radioactive and biological rates and astrophysical periods. This encourages to think that quantum communications *resp.* control based on  $Z^0$  *resp.*  $W$  MEs could be present also at the level of solar system and even longer length scales. The interpretation would be in terms of dark variants of weak bosons having very low masses.

### 2.3.5 What Brain Structure And Fractality Teaches About Magnetospheric Motor Control?

The first bundle of questions relates to the idea that brain structure and fractality could teach something about magnetospheric motor control (and perhaps also vice versa!).

#### Can one identify magnetospheric motor and sensory areas?

The mapping of the brain structure to that of magnetosphere to be discussed later in detail leads to the conclusion that day side outer magnetosphere very naturally corresponds to hind brain containing associated sensory areas whereas night side outer magnetosphere would correspond to frontal brain containing associative motor areas and association regions for high level planning. For the inner magnetosphere the only sensible option is that the representations at the same side of the globe correspond to sensory areas (otherwise one cannot realize 40 Hz sensory representations): those at the opposite side of the globe could, but need, not to correspond to motor areas. Right and left brain hemisphere in turn correspond to northern and southern magneto-hemispheres.

The example of brain suggests that the lowest motor and sensory areas are relatively hard wired. The higher areas responsible for the imagination and planning of the motor action should be less hard wired. Thus the areas responsible for planning imagination should be initial value sensitive and near to criticality. This would suggest that in the case of magnetosphere transition regions are the regions which are most natural candidates for sensory and motor areas. Bow shock, magneto-pause, plasma sheet, the transition region between inner and outer magnetosphere, and inner and outer radiation belts are good candidates for this kind of regions. Inner and outer radiation belts and the transition region between inner and outer magnetosphere could correspond to primary, secondary and tertiary sensory and motor areas whereas magneto-pause would correspond to sensory and motor associative regions. Even bow shock might be involved.

The magnetosphere of Earth is part of the solar magnetosphere and if helio-magnetosphere controls the behavior of the planetary magnetospheres, it must use those parts of the planetary magnetospheres which it can affect. Note that the effect of the solar spot activity on the human sensory consciousness (complex hallucinations) could be understood as being partially due to the effect of the solar wind on the day side magneto-pause, which is the counterpart of the sensory associative areas.

#### How do the magnetospheric structures communicate?

Ionic supra currents are the most obvious means of communication and would be counterpart for the corresponding communications at the level of brain a la TGD. Also Ohmic ionic currents in plasma rich regions (the current along plasma sheet down to ionosphere, ring currents, ...).

The topology of Earth's magnetic field provides a good overall view about the "neural circuitry" of Mother Gaia. There are ionic supra currents flowing along magnetic flux tubes around magnetosphere, both inner and outer. In the case of magnetic lobe, which seems to extend to the distance  $10^3 R$  these currents are also present. Radiation belts contain besides ring currents also ionic supra currents running back and forth along magnetic flux tubes. Josephson junctions between magnetic flux tubes might be an overall important aspect of the communications.

There are also currents associated with the transition regions where the tangential component of the magnetic field changes (magneto-pause, transition region between inner and outer magnetosphere, the boundary of the plasma sheet, ...) running along the transition surface and orthogonal to the discontinuity of the magnetic field. These currents might be also supra currents

and make possible horizontal communications inside these structures (magneto-pause would be the counterpart of associative regions) analogous to the horizontal neural communications inside regions of brain.

The regions of magnetosphere could communicate also by ME projectors. Also resonance is possible. For instance, the day side magneto-pause (associative sensory regions) and night side magneto-pause (associative motor regions) could communicate by projector MEs associated with the protonic cyclotron transitions and electronic spin flip transition.

### What is the counterpart of the thalamocortical circuitry?

One can also make questions about the counterpart of the thalamocortical resonance circuitry.

1. Inner and outer radiation belts turn out to be the magnetospheric counterparts of the primary and secondary sensory (same side of the globe) and motor (opposite side of the globe) areas in the mapping of the brain structures to magnetospheric structures. If the magnetic flux tubes of Earth emanate also from brains as they should do, a direct interaction with brain with the mediation of the supra currents becomes possible. Second form of control is based on ME projectors, in particular  $Z^0$  MEs.
2. Radiation belts do not only serve as radiation shield but would control the super-conducting dynamo generating magnetosphere. Since radiation belts are strongly affected by cosmic rays and solar wind, they indeed serve as kind of motor organ in very general sense. During solar storms the ionic supra currents running back and forth in radiation belts can leak from the magnetic bottle and end up to the the super-conducting dynamo in Earth interior and thus modify the strength of magnetic field. This control would be the magnetospheric counterpart of long term control of brain upon itself changing the very structure of brain.
3. Earth's inner core takes the role of thalamus in the mapping between brain and magnetospheric structures. This would suggest that Earth's inner core serves as a relay station through which the ionic supra currents run between regions of magnetospheric brain. Thalamocortical feedback suggests a strong feedback from radiation belts to magnetospheric thalamus and the dipole structure of the magnetic field guarantees this. This would however require that the super conducting ions can leak from the magnetic bottle formed by the increasing strength of the magnetic field inside magnetic tube toward northern and southern latitudes. Classically this is achieved if the longitudinal kinetic energy of the charged particle is high enough so that it is not completely transformed to the energy of the transversal motion before entering into the core. It is known that the ions can have much higher energies than expected [F5].

### 2.3.6 Do The Structures Of Nervous System And Magnetosphere Correspond To Each Other Fractally?

Control levels corresponding to magnetic and  $Z^0$  magnetic transition frequencies varying up to the time scale of life cycle might be present and correspond to a hierarchy of motor canvases. If this is the case, the hierarchy would continue to the length scale of light life.  $Z^0$  magnetic structures more or less resembling magnetic ones could be responsible for the hierarchy of motor canvases whereas magnetic structures could represent sensory canvases. The resonance condition  $f = c/L$  fixes the representational hierarchy practically completely by telling the distance at which given frequency is representable resonantly.

The correspondence between sensory areas and the periods of the periodic table follows from the p-adic length scale hypothesis and  $v = Lf$  scaling law [K41]. The model for the magnetospheric sensory canvas gives hopes of understanding this hierarchy at a deeper level, and leads to a general vision about how sensory experience, memory, and imagination correlate with the structure of the magnetosphere.

It must be emphasized that sensory representations of magnetic Mother Gaia are in question: these representations might however be behind our memories and imagination. These representations could result as a by-product of the representations at personal sensory canvas and magnetosphere. The best one can hope that there is a detailed correspondence between brain

structures and those of magnetosphere induced by the projector MEs associated with the personal sensory canvas.

### Representations in the ionosphere

For the representations in the lower ionosphere the transition frequencies would not differ appreciably from those at the surface of Earth and the representing ion could be same as the endogenous ion. 10 per cent variation for the endogenous transition frequency would mean variation of 3.3 per cent for distance so that the representations using same ions would make sense up from  $1.01R$  to  $1.04R$  which means the height interval 80-190 km (note that the lower boundary of ionosphere is at about 80 km). Endogenous magnetic field should be at least about 1 percent lower than the external magnetic field to guarantee that representation is above 80 km. Distance condition cannot be satisfied for these representations if one assumes that MEs have length equal to the distance from the representation point.

These representations would correspond to the lowest level representations associated with neurons, spine, and brain stem, which have emerged first during the evolution and should emerge first also during the development of individual. Also features could be represented using these low level sensory canvases and entangled to the points of the higher level sensory canvases.

At higher heights the representations with  $A_I < A$  are in principle possible and could form a hierarchy. At  $r = 2R$  representing the upper boundary of ionosphere protonic cyclotron frequency is 37.5 Hz.  ${}^4He^+$  ion would have cyclotron frequency about 12 Hz at this height. Rather remarkably, thalamocortical resonance frequency corresponds to the protonic radiation belt where the density of ions is high and representation should be intense.

### Inner magnetosphere does not allow representations in theta and delta bands

The resonance condition  $f = c/L$  stating that ME acts as a resonant wave, when applied at the boundaries of the inner magnetosphere ( $4R$  at day side and  $6R$  at night side), implies the lower bound 12.5 Hz *resp* 8.1 Hz for the frequencies representable at day side *resp.* night side. The conclusion is that in day side only beta and gamma bands are representable whereas night side allows also alpha band. This representation independent prediction is of utmost importance since at least our sensory and cognitive consciousness involves mostly beta and gamma bands and during sleep and meditative states theta and delta bands dominate.

One could also wonder whether the first person aspect of consciousness corresponds to the inner magnetosphere rotating with Earth and whether transpersonal consciousness (me experienced from third person perspective as in OBE experiences) could correspond to the outer magnetosphere (which does not rotate with Earth) plus plasma sheet. The frequencies near Schumann frequency would be at the boundary of these two modes of consciousness. During hypnagogy which is between these two modes, Schumann frequency indeed dominates EEG.

Protonic cyclotron transitions represent resonantly in the range 12.5 – 100 Hz (note that the upper bound corresponds to the highest EEG frequencies) and maximum protonic flux in the protonic radiation belt corresponds to frequencies around 40 Hz thalamocortical resonance band. The representation at the same side of the globe would be responsible for immediate sensory memories and the representation at the opposite side of the globe for symbolic, more long term memories. Also electronic spin flip represents: the maximum of the electron density in the outer radiation belt corresponds roughly to 12.5 Hz frequency. The deviation of the magnetic field from the exact dipole form modifies this prediction somewhat. Electronic  $Z^0$  spin flip frequency varies in the range 9.4 – 25.0 Hz and could represent symbolically motor skills (opposite side of the globe and alpha band) and motor imagination occurring in a shorter time scale (the same side of the globe and beta band).

### Plasma sheet and magneto-pause and consciousness in theta and delta bands

Because of their highly unstable character, both plasma sheet and magneto-pause accompanied by plasma mantle might be seats of the magnetospheric imagination and very high level bio-control realized using protons and electrons. Plasma sheet might also receive sensory input from the magneto-pause.

Ionic density is a direct measure for the intensity of the contribution to the conscious experience coming from given region of space and this is a natural criterion when one tries to understand the possible roles of various magnetospheric structures for consciousness. Plasma sheet [F8] indeed contains a high density of ions and thus could act as a layer of effectively two-dimensional computer screens of thickness of order  $R$ . In this region the intensity of magnetic field transforms from 10 nT to about 20 nT inside lobe immediately above plasma sheet. According to some sources the value of the magnetic field is 30 nT inside the lobe: this might hold true in nearby region. The structure suggests a sensory or a motor representation in which the vertical distance from the sheet represents the distance for the object of perceptive field.

The resonance condition  $f = c/L$  (higher harmonics of fundamental frequency for ME are not allowed) implies that only frequencies from 8.1 Hz down to .8 Hz, that is theta and delta band, can be represented in plasma sheet whereas alpha, beta and gamma bands would be represented in the inner magnetosphere at the night side. At the day side only beta and gamma bands are representable. The higher harmonics of protonic cyclotron frequencies make it possible to satisfy this condition in the plasma sheet (the distance of the representing surface varies as  $r/R \propto 1/n$ ). Various cyclotron harmonics would be nicely ordered along the plasma sheet. Similar conclusion holds true in the case of magneto-pause. Also electronic cyclotron spin flip frequency provides single representation.

The harmonics of the electronic  $Z^0$  cyclotron frequency provide representations in this region. The time scale is very slow: roughly  $Z^0$  representation could be responsible for high level motor control, perhaps for learned motor skills.

The electronic cyclotron spin flip frequency would be of order 1 cycle per 5 seconds whereas protonic cyclotron frequency would be 1 cycle per 15 seconds. 5 second time scale is involved with Comorosan effect. Furthermore, a 5 second delay that has been observed between the onset of a 1 to 2 mT magnetic field (about 40 times stronger than Earth's magnetic field) and the first bursts of brain activity responding to the magnetic field (Science 260 (11 June 1993), 1590). A further fascinating observation to be discussed later is that plasma sheet is a highly self-organizing structure containing "features" like "eyes" and "wings" [F11].

For 10 nT magnetic field the cyclotron time scale is 16.7 seconds for protonic cyclotron transitions and 8.9 ms (112 Hz) for electronic cyclotron transitions. For the latter time scale resonant amplification is not possible. For  $Z^0$  magnetic lobes cyclotron time scales are scaled up by a factor 800 to 3.7 hours and 7.1 seconds for proton and electron respectively. For electron higher harmonics allow to satisfy the resonance condition.

For endogenous  $Z^0$  magnetic field the transition frequencies are around 10 Hz for all atoms and molecules except hydrogen atom and much higher than  $Z^0$  cyclotron frequencies in the magneto-pause and plasma sheet.  $Z^0$  motor control from the magneto-pause is possible if  $Z^0$  MEs generate endogenous sound waves by  $Z^0$  piezoelectric effect, which in turn are transformed to electromagnetic oscillations via the ordinary piezoelectric effect.

In light of these arguments, the idea that plasma sheet and magneto-pause could contribute to our consciousness via the sharing of mental images might make sense. More detailed developments inspire a very concrete mapping between brain structures and magnetospheric structures and plasma sheet corresponds in this mapping to the magnetospheric self model located in insula whereas day side and night side magneto-pauses correspond to sensory and motor association regions. By the sharing of mental images also our self models are represented at plasma sheet.

### Are magnetic lobes, magnetosheath, and solar magnetosphere involved?

The density in magnetic lobes is about .01 ions per cubic centimeter so that these regions are analogous to the brain cavities containing white matter. Thus one might think they do not give a significant contribution to our everyday consciousness. In TGD framework however also blood cells are excellent candidates for defining sensory representations and this contribution to consciousness would correspond to the bodily "what it feels" consciousness (proprioception) whereas neuronal consciousness would represent the world as experienced from outside (seen and heard). Magnetic lobes and more generally, all regions of the magnetosphere outside the transition regions, are good candidates for this kind of sensory and motor representations.

According to [F13] the asymptotic value of magnetic field (outside plasma sheet,  $r \geq 100R$ ) in lobes is 9.2 nT. Second reference [F3] reports 30 nT magnetic field in magnetic fields and

presumably refers to region  $r < 60R$ . The scale of frequencies is same as in plasma sheet and magneto-pause so that the conclusions of the previous section apply.

Despite the low density of protons, the representations based on the harmonics of the cyclotron frequency are in principle possible also inside lobes and the low intensity of experience might explain why proprioception is an almost unconscious sense. The harmonics of the protonic cyclotron frequency define a sequence of representation surfaces inside lobes. These representations result naturally if the projector MEs associated with the personal sensory canvases intersect the magnetic flux tubes. The endogenous magnetic transition frequencies would be associated with heavier molecules with mass numbers around  $A \sim 1500$ . If magnetic lobes contribute to our consciousness, they contribute most probably to consciousness in meditative states. In certain sense “cosmic” consciousness would be in question. The control from this level could be bio-control rather than control of the behavior of an individual organism at conscious level.

In magnetosheath and solar magnetosphere the density of the ions is few ions per cubic centimeter and thus much higher than inside magnetic lobes so that they are better candidates for the seats of sensory representations. Possible are also the representations at the flux tubes of the interplanetary magnetic field, where the density of ions is few ions per cubic centimeter and thus much higher than inside magnetic lobes.

## 2.4 Resonant Representations

In this section magnetospheric representations satisfying some kind of resonance condition are studied. One can imagine several resonance mechanisms.

1. The first representation is based on the requirement that ME has length equal to the wavelength corresponding to the magnetic transition frequency so that ME acts as a wave cavity.
2. In the case of magnetic mirror Alfvén waves associated with the magnetic flux tube parallel to ME could provide an additional resonant amplification.
3. The second representation utilizes cavity resonances (in particular Schumann resonances). Even the representations at personal magnetic canvas could utilize this mechanism if personal projector MEs intersect the magnetic flux tubes of Earth’s magnetic field.
4. Also spherics associated with lightnings might act as amplifiers.

### 2.4.1 Hierarchy Of Sensory Representations At Magnetic Mother Gaia

In principle the cyclotron transitions of a given ion with mass number  $A$  in brain could be represented as transitions of any lighter ion with mass number  $A_I$  carried by magnetic flux tubes of Earth’s magnetic field. Thus one obtains a hierarchy of representations labelled by the pairs  $(A, A_I)$ ,  $A_I \leq A$ .

1. The magnetic sensory canvas defined by Earth’s magnetic field contains certainly protons. The requirement that the ionic cyclotron frequency  $f_p/A$  in brain equals to the protonic cyclotron frequency  $f_p$  at the magnetic flux tube of Earth’s magnetic field at distance  $r$  gives in dipole approximation (implying  $1/r^3$  behavior) the constraint

$$\begin{aligned} \frac{r}{R} &= KF(\Theta, \theta) \ , \\ F &= \left[ \frac{\sqrt{1 - 6\cos(\Theta) + 9\cos^2(\Theta)}}{\sqrt{1 - 6\cos(\theta) + 9\cos^2(\theta)}} \right]^{1/3} \ , \\ K &= A^{1/3} \ . \end{aligned} \tag{2.4.1}$$

The angle dependent factor  $F(\Theta, \theta)$ , where  $\theta$  denotes the polar angle for brain and  $\Theta$  for the point of magnetosphere, comes from polar angle dependence of the magnetic field.  $F(\theta, \Theta)$

varies in the range  $[1/2, 2]$ . The sensory canvases associated with heavier ions are farther away. For  $\theta = \Theta$  (vertical projection) one has  $r/R = A^{1/3}$  and  $A = 20$  gives  $r/R \simeq 2.1$  and  $A = 100$  gives  $r/R \sim 4.6$ .

2. The magnetic flux tubes containing electrons provide second very natural sensory representation. The formula for the distance reads now as

$$K = (m_p/me)^{1/3} A^{1/3} . \quad (2.4.2)$$

3. Any ion can serve as a representative ion at the sensory canvas and the distance is in general case given by given by

$$K = (A/A_I)^{1/3} . \quad (2.4.3)$$

The higher the mass number of representing ion at the canvas, the shorter is the distance to the canvas. The increase of the mass of the “brainy” ion means the increase of the distance of the representation.

4. The endogenous variation of flux tube thickness and the deviation of Earth’s magnetic field from the exact dipole form implies the generalization of the formula

$$\frac{r}{R} = K \times (B_e/B(r, \Theta))^{1/3} . \quad (2.4.4)$$

Here  $B_e \sim .5$  Gauss denotes the endogenous value of the Earth’s magnetic field whose variation is essential for the frequency coding.  $B(r, \Theta)$  denotes the value of the Earth’s magnetic field at given point of magnetic flux tube.  $B_e$  must be distinguished from dark magnetic field  $B_{end} = 2B_E/5 = .2$  Gauss used to explain the findings of Blackman and others. The simplest assumption is that the condition  $B_{end}/B_E = 2/5$  is satisfied quite generally in magnetosphere.

5. Even the ions of macromolecules could drop on the magnetic flux tubes of the endogenous magnetic field so that one could have an onion like hierarchy of sensory canvases labelled by the atomic weight  $A$  of the ion. Cellular size is certainly the upper bound for the size of the ionized structure and for water density this would give the upper bound  $r/R < 10^4 \times R \sim 10^{10}$  meters in protonic case, and  $r/R < 10^{11}$  meters in electronic case, approximately the size of the solar system. Small variations of the ionic cyclotron frequency in brain correspond to the small variations of radial distance at the magnetic sensory magnetic canvas.
6. If one does not allow overlap of the regions of magnetic sensory canvases associated with different ions in brain (mass number  $A$ ) one must have

$$\frac{B_{min}}{B_0} \geq \frac{A}{A+1} \quad \text{or} \quad \frac{B_0}{B_{max}} \geq \frac{A}{A+1} . \quad (2.4.5)$$

For large values of  $A \sim 100$  this allows one percent variation of cyclotron frequency scale. Actually larger variation is possible since only biologically important ions are involved with the sensory representations.

### 2.4.2 Endogenous Frequency Fixes The Representation Sphere

The elegance of the place coding by magnetic transition frequency is that the excitation of the frequency corresponding to a given distance automatically stimulates magnetic transition at a correct distance at the sensory canvas. There is only weak dependence on the position of the observer at the surface of Earth even when some fixed structure, say magnetosphere is used to realize the sensory representations. Given frequency determines for given brain a two-dimensional surface (kind of computer screen) of magnetosphere, actually two of them corresponding to different sides of Earth. In some cases the number of this kind of surfaces might be larger.

A given endogenous cyclotron frequency

$$f_m = k \frac{eB_{end}}{m} , \quad (2.4.6)$$

where  $k$  is a numerical constant, in turn defines a 2-dimensional surface. The harmonics of endogenous cyclotron frequency define a sequence of surfaces with increasing sizes. In the dipole approximation

$$\bar{B} = B(R, \phi = \pi/2) \times \frac{R^3}{r^3} (\bar{e}_z - 3\cos(\Theta)\bar{e}_r) , \quad (2.4.7)$$

the harmonics of the cyclotron frequency this sequence is given by

$$\frac{ke}{m} B(R, \pi/2) \times \frac{R^3}{r^3} \times \sqrt{1 - 6\cos(\Theta) + 9\cos^2(\Theta)} = f_{end} = n f_m , \quad (2.4.8)$$

which are obtained by the scaling  $r \rightarrow n^{-1/3}r$  from  $n = n_{min}$  surface. This scaling property holds quite generally and for transitions involving spin flip the scaling factor changes from  $n^{-1/3}$  to  $(n + \Delta)^{-1/3}$ . The distance between subsequent surfaces behaves as  $1/n^{4/3}$  and becomes small for large values of  $n$ . Note however that finite range  $[n_{min}, n_{max}]$  of values for  $n$  is possible. By varying the endogenous magnetic field the scale of the cyclotron frequency can be varied.

In magnetic lobes and plasma sheet the dipole approximation fails badly. Inside plasma sheet the representing surfaces are in a good approximation sheets parallel to plasma sheet. Magnetic field strength varies  $B_E$  from  $\sim 10$  nT to  $\sim 20$  nT from the interior of sheet to the exterior of sheet so that one octave of frequencies is still representable also for  $B_{end}$  by the basic assumptions. These sheets appear as northern-southern degenerate pairs. This brings in mind the left-right degeneracy of the sensory representations at the level of brain. The hypothesis that left and right brain hemispheres project to opposite magneto-hemispheres is at least worth of studying. Resonance at the fundamental frequency of the projector ME is possible only if the representation is realized at very long distance: for an electronic cyclotron spin flip the resonance distance would be  $272R$  and for proton cyclotron resonance  $817R$ .

Note that also the representations below Earth's surface must be considered since projector MEs should be able to penetrate the Faraday cage defined by Earth's surface (the cage is associated with atomic space-time sheets only). These high frequency representations might be also relevant.

### 2.4.3 Projector MEs As Wave Cavities

EEG contains several resonances frequencies and the most natural explanation for them is as resonances in a wave cavity defined by ME having length equal to the resonance wavelength defined by the endogenous magnetic transition frequency. The nice aspect of this representation is the possibility of resonant amplification of the EEG signal.

#### Resonance conditions

Projector MEs could be reflected from the flux tubes of Earth's magnetic field at distance  $L$ , which at resonance of  $n$ : th order is integer multiple  $nL_m$  of the magnetic transition length  $L_m = c/f_m$ , where  $f_m$  represents a variable endogenous magnetic transition frequency:

$$L = nL_m = \frac{c}{f_m} . \quad (2.4.9)$$

Thus the sensory canvas for a given frequency is a subset of a brain centered sphere of radius  $L_m$

$$|\bar{r} - \bar{r}_{brain}| = L = nL_m . \quad (2.4.10)$$

The intersection of this surface with the sphere surrounding the brain defines 1-dimensional curve where the resonance occurs. For large values of  $L = nL_m$  the conditions do not have any solutions at all. This is clear from the fact that  $L$  behaves like  $r^3$  whereas  $|\bar{r} - \bar{r}_{brain}|$  behaves as  $r$  and grows much slower. Thus solutions can be found only for sufficiently high endogenous frequencies representable as high harmonics of the cyclotron frequencies at the magnetic canvas.

1. *The situation in which longitudinal momentum increment vanishes*

If the magnetic transition is such that one can neglect the increment of the longitudinal momentum of the representing particle, one obtains a set of one-dimensional curves labelled by the pairs  $(n_c, n)$  of integers. Each harmonic  $n_c$  of the cyclotron frequency gives rise to closely spaced one-dimensional curves on the corresponding sphere. The variation of the endogenous cyclotron frequency scale implies that a set of two-dimensional surfaces close to each other is obtained. For large values of  $n$  this gives quite good representation for the sensory canvas although the quantization of 3-dimensional volume to 2-dimensional surfaces is unavoidable. From the point of view of information processing this compression of information is desirable.

For a given cyclotron harmonic  $n_c$  one can get a good grasp about the situation by solving  $n_c$  from the resonance condition when projector ME is vertical:

$$n_c = \frac{2\pi f_s}{f_c(r=R, \theta)} \frac{x^3}{x + \epsilon} \rightarrow \frac{2\pi f_s}{f_c(r=R, \theta)} x^2 , x \rightarrow \infty . \quad (2.4.11)$$

$\epsilon = \pm 1$  refers to the representation at the same/opposite side of the globe. For large values of  $x$  one has  $n_c \propto x^2$  so that the distance behaves like the radius of a Bohr orbit for a quantized harmonic oscillator.

In the plasma sheet the time averaged magnetic field is constant equal to  $B_E \sim 10$  nT. The harmonics of a given cyclotron frequency  $f_c = qB/2\pi m$  define a series of octave wide representations at the plasma sheet. The distance  $r$  associated with a given cyclotron frequency is given by the resonance condition as

$$x \equiv \frac{r}{R} = -\epsilon + \frac{k}{n_c} , \quad k \equiv \frac{2\pi f_s}{f_c} , \quad (2.4.12)$$

where  $f_s = c/2\pi R = 7.8$  Hz is Schumann frequency.  $\epsilon = \pm 1$  corresponds to the representations at the same/opposite side of the globe. The condition  $8 \leq x \leq 60$  gives the bounds  $k/(60 + \epsilon) \leq n_c \leq k/(8 + \epsilon)$  for  $n_c$ . For instance, for proton the allowed range of harmonics is  $13 \leq n_c \leq 90$ .

2. *Taking into account the increment of longitudinal momentum*

The previous discussion is oversimplified in that it does not take into account the increment of the longitudinal momentum of the representing particle. The ions at the magnetic flux tubes have also kinetic energy  $E = k^2/2m$ ,  $\hbar = 1$  associated with the longitudinal motion (this is indeed the case for the magnetic flux tubes of Earth's magnetic field). The possibility that the longitudinal kinetic energy of large number of ions changes in the magnetic quantum phase transition simultaneously brings in an additional degree of freedom, which replaces the discrete curve associated with a given endogenous frequency with a set of curves.

In this case the formula for  $n_c$  (assuming that the projector is in the vertical direction) generalizes to

$$n_c = \left[ 2\pi f_s \frac{1}{x + \epsilon} - \frac{\Delta k^2}{4\pi m} \right] \frac{x^3}{f_c(r = R, \theta)} . \quad (2.4.13)$$

Clearly the variation of  $k$  allows variation of  $x$  characterizing the length of ME.

The effective continuity of the new degree of freedom is not guaranteed since the value of the momentum  $k$  is quantized to the multiple of  $k_0 = \pi/l$ , where  $l$  is the length of the magnetic flux tube, just as in the case of the Alfvén waves so that one might expect a coupling of superconducting particles to Alfvén waves to be present. The representation with a given endogenous frequency becomes effectively continuous and thus two-dimensional if the condition

$$\frac{\Delta k^2}{2m} \simeq \frac{2k\Delta k}{m} \ll n f_c \quad (2.4.14)$$

holds true. This implies that the representation obtained by varying the endogenous frequency becomes effectively 3-dimensional.

The quantization of the longitudinal momentum implies that the condition is not trivially satisfied and requires

$$E_{||} \ll \pi n_c f_c . \quad (2.4.15)$$

For energetic ions and electrons the new degree of freedom is still more discrete than that associated with cyclotron frequency (recall that cyclotron energy scale is extremely low).

For highly relativistic particles (say electronic Cooper pairs in outer radiation belt with energies up to 10 MeV) with energy higher than the rest mass, the longitudinal kinetic energy is in a good approximation given by  $E_{||} = n_{||}\pi c/l$  and in this case the effective condition reduces to  $l \gg L$ , which is satisfied in a reasonable approximation. Thus electronic radiation belts could give rise to effectively 2-dimensional representations whereas nearby representations in the ionosphere and protonic representations would be one-dimensional. In particular, 40 Hz protonic representations would be one-dimensional.

### Can one understand basic facts about sensory representations?

The basic prediction is that resonance representations are effectively three-dimensional if the increment of the longitudinal kinetic energy of the ions is small in the magnetic transition and if the endogenous frequency varies. If the increment of the longitudinal energy is not possible, the representations are 2-dimensional and reduce to 1-dimensional if endogenous frequency does not vary. In general case one obtains actually a sequence of representation surfaces with effectively quantize 3-space to a collection of 2-dimensional surfaces.

Brain indeed contains two-dimensional representations: consider only the somatosensory maps of skin. Also the visual information from retina is two-dimensional and the objects of the visual field are represented as two-dimensional surfaces. The 3-dimensional visual field could result as a high level construct but it is not at all obvious whether genuinely three-dimensional representations are really needed. The compression of information implied by discretization might be more useful than faithful 3-dimensional representation.

Many fundamental features (such as edges, lines, triangles, circles) in the sensory representations of brain seem to be one-dimensional. Quantum entanglement between various levels in the hierarchy of sensory representations allows modularity so that an object of a lower level representation can be assigned to a point of a higher level sensory canvas. Low level representations, say 40 Hz representation at primary sensory areas are two- or one-dimensional depending on whether the endogenous frequency varies or not. By quantum entanglement these one- or two-dimensional features might be associated with higher level representations which might be non-resonant and thus genuinely two or three-dimensional representation for the positions of the perceptive field.

### Could also Alfvén waves be involved?

A further interesting point is related to the Alfvén waves. Alfvén waves are a somewhat phenomenological concept based on the notion of field line resonance (FLR). The idea is to treat field line as a system analogous to a violin string so that the frequencies of the modes are given by  $\omega = nk_{\parallel}$ ,  $k_{\parallel} = n\pi/L$ , where  $L$  is the length of the field line. Whether Maxwell's equations really allow FLR concept has been questioned [F18].

Amusingly, it seems that Alfvén's intuition might have gone far beyond Maxwell's theory. In TGD framework FLR modes correspond to the oscillation modes of the magnetic flux tubes and are very similar to the massless modes associated with strings (see the appendix). For straight flux tubes parallel MEs with same length as the magnetic flux tube would couple to the FLR modes resonantly and the ends of the magnetic flux tube would act as a pair of mirrors. This resonance mechanism might be crucial for the representations at the personal magnetic sensory canvas.

Also curvilinear MEs are possible but it is not clear whether the general solution ansatz for MEs allows also curvilinear MEs so that any flux tube would couple resonantly to parallel MEs. In this case the resonance condition would state that the length from brain along the magnetic flux tube to the representation point equals to the wavelength associated with the magnetic frequency at the representation point. This would allow to widen the representational repertoire to lower frequencies.

### 2.4.4 Sensory Representations Appear As Night-Day Conjugate Pairs

MEs should penetrate the Faraday cages defined, not only by the low boundary of ionosphere, but also by Earth itself. This means that it is possible to have sensory representations at the other side of the globe. As found, resonance conditions for the representation points at the same side of the globe do not have solutions for too low values of the magnetic transition frequency since the sphere associated with the observer is so large that it does not intersect the magnetic transition frequency = constant surface. One can however improve the situation by allowing the representation at the other side of globe. Thus representations come as pairs: a high frequency representation at the same side of Earth as the observer and a conjugate low frequency representation at the other side of the globe.

One can derive the lower bound for the resonance frequencies by simply noticing that the degenerate cases for the sensory representations correspond to a situation in which the vector  $\vec{r}$  of the point of the sensory canvas and the vector  $\vec{r} - R\vec{e}$  from the brain to the point of the sensory canvas are parallel. In this case representation point is vertically above the brain and the length of the ME determined by the endogenous transition frequency equals to the magnetic transition frequency in Earth's magnetic field. These two extremes define the frequency range which is representable for a given representative ion with atomic weight  $A_I$  and represented ion  $A$ .

In order to gain insight it is useful to study a simplified example idealizing Earth's magnetic field strength behaves strictly as  $1/r^3$ . If one requires that the length of the projector ME is same as the distance of the activated magnetic flux tube from the surface of Earth, one obtains a condition for the ratio  $A/A_I$ . The vertical distance  $d$  from the surface of Earth to the flux tube would be given by

$$d = R((A/A_I)^{1/3} - \epsilon) , \quad (2.4.16)$$

whereas the length of ME is under simplest assumption cyclotron wavelength  $\lambda_c = A/f_p$ .  $\epsilon = 1/-1$  holds true for the representation point at the same/opposite side of the globe.

This gives the conditions

$$\frac{[(A/A_I)^{1/3} - \epsilon]}{A} \times \frac{f_p}{2\pi f_s} = 1 . \quad (2.4.17)$$

Here  $\epsilon = 1$  corresponds to the representations at same side of globe and  $\epsilon = -1$  to the representations at the opposite side of the globe.  $f_p/2\pi f_s \simeq 6.1$  holds true for  $B = .5$  Gauss. The condition selects proton ( $A_I = 1$ ) as optimal for the sensory representations.

### Protonic and atomic cyclotron transitions

The numerical study of the condition of Eq. 2.4.17 in the case of proton demonstrates that the protonically representable frequency range is 12.5 – 100 Hz and thus contains beta and gamma bands but not the lower bands. This conforms with the fact that only these bands seem to correlate directly with our sensory and cognitive consciousness (note that these representations presumably correspond to our memories). Na ( $A = 13$ ) corresponds to the lower end of the spectrum and tritium ( $A = 3$ ) to the upper end of the spectrum. Li ( $A = 7$ ) and possibly  $O^{--}$  ( $A/Z = 8$ ) correspond to 40 Hz resonance band. Of course, these considerations are only order of magnitude considerations and the weak directional dependence of the magnetic field strength has been neglected. The homeostasis of the endogenous magnetic field does not help to satisfy the condition since the replacement  $B \rightarrow xB$  only means the replacement  $A \rightarrow A/x$  in the formula above.

Higher harmonics of the proton cyclotron frequency suggest a possibility to widen the representational repertoire to include alpha band perhaps even theta band.  $n = 3$  cyclotron transition allows the range (7.0 – 12.5) Hz ranging from Ca to Mg. In this case however the distances are of order  $r = 6R$  so that dipole approximation fails and the conclusion about the representability of alpha band are somewhat questionable.

${}^4He^{++}$  ( $A_I/Z = 2$ ) ion provides a second candidate for sensory representation. This representation allows ions with  $A \leq 19$  (F) and cyclotron frequencies above 15.8 Hz.  ${}^4He^+$  ( $A_I/Z = 4$ ) ion provides a third candidate for sensory representation in this case oxygen ( $A=16$ ) with cyclotron frequency 17.8 Hz is the heaviest representable molecule. It is obvious that when  $A_I$  increases the molecular weight of the heaviest representable molecule decreases.

### Electronic transitions

Electronic cyclotron spin flip transition provides a second natural candidate for sensory representation. Since the frequency is 902 Hz it corresponds to  $n = 3$  cyclotron transition for proton and effectively to  $A_I = 1/3$ . In this case the representable frequency range is (8.6 – 18.8) Hz and contains also alpha band. The lower end of the spectrum corresponds to  $Cl^-$  ( $A = 35$ ) and the upper end to  $O^+$  ( $A = 16$ ), which are thus only marginally representable. The representable frequency range corresponds to frequencies above 18.8 Hz.

For the electronic cyclotron transitions for which one effectively has  $A_I = m_e/m_p$ , the distance from the point of the magnetic sensory canvas is in general much longer than the minimal length of ME so that ME frequencies must correspond to higher harmonics of the fundamental frequency  $c/L$ . The frequencies are above 2.7 kHz for  $r < 6R$  in dipole approximation. Electronic cyclotron transitions could provide a representation of audible frequencies above kHz whereas cyclotron spin flip frequencies would represent audible frequencies below 1 kHz.

One could consider also the possibility of a sensory representation based on magnetic flux tubes of the interplanetary magnetic field. The strength of magnetic field varies in the range .2 – 80 nT with average value around 6 nT. For electronic cyclotron transition the corresponding frequency range is 2.4-960 Hz with the length of projector ME varying in the range 20.4 – .05R. 6 nT corresponds to 7.2 Hz corresponding to length 6.8R of projector ME. Thus also theta and delta band are included. Since the average solar magnetic field is constant it should be possible to find a point outside magnetosphere for which the resonance condition is satisfied. For protonic representations the frequency scales are scaled down by a factor  $2^{-11}$  and could be also realized but now the distance range is scaled up by a factor  $2^{11}$  and this means that distances are at east of order 100R. During sunspot maxima this contribution to consciousness should be maximal but also shifted to frequencies higher than 7.2 Hz.

### Thalamocortical resonance band and magnetospheric sensory representations

The sounds produced by meteors are in the thalamocortical resonance range 37.5 – 43.0 Hz instead of the expected range  $20 - 2 \times 10^4$  Hz for sferics and much stronger than expected and strongly dependent on position and the direction of meteor [F15]. This encourages the explanation in terms of resonances associated with the projector MEs at 40 Hz band emerging from brain and also from inorganic matter (sounds were recorded also electronically) and acting as amplifying wave guides [K15] ).

In light of this thalamocortical resonance band which is excellent candidate for the cyclotron frequencies associated with the magnetospheric sensory representations at primary sensory areas. The resonance range is indeed bounded by  $A = 8$  and  $A = 7$  cyclotron frequencies (37.5 Hz and 42.9 Hz). There are two options.

1. Thalamocortical representation could be associated with Cooper pairs of  $Li^+$  ions having  $A = 7$ . Endogenous magnetic fields would vary in the range  $(7/8, 1) \times B_0$ ,  $B_0 = .5$  Gauss, for this representation. The predicted 12.5 per cent variation is consistent with the general  $\sim 10$  per cent relative variation of EEG frequencies. That lithium acts as an antidepressant might relate to its role in generating sensory representations.
2.  $O^{--}$  ions or doubly ionized water molecules ( $A/Z = 8$ ), perhaps resulting when the  $OH$  bonds of a water molecule split, are second option. Note that doubly ionized oxygen is boson as is also  $Ca^{++}$  ion. In this case endogenous magnetic fields would vary in the range  $(1, 8/7) \times B_0$ , which means 14 per cent relative variation of the cyclotron frequency.

Both  $Li^+$  and  $O^{--}$  could be involved and be related to the sensory representations of the interior milieu (world as it feels) and external world (world as experienced in the third person perspective). In [K41] it is suggested that these two representations are separated by blood-brain barrier and are realized by sensory projectors emanating from red blood cells and pyramidal cells respectively (both cells contain magnetic structures).  $O^{--}$  would be associated with red blood cells whereas  $Li^+$  would relate to the pyramidal cells.

### 2.4.5 Representations Based On Cavity Resonances

Various resonances associated with the magnetosphere might help to amplify the cyclotron frequencies represented by MEs. There is indeed a rich repertoire of various oscillation modes associated with the magnetosphere. Being not a specialist, I can mention only the most obvious examples. Various structures defined by Earth and magnetosphere define a hierarchy of space-time sheets and the cavity resonances of the classical fields associated with are the most obvious candidates for amplification purposes. Cavity resonance frequencies could be same or very nearly same for both classical em and  $Z^0$  fields. This is certainly the case if large space-time sheets can carry both electromagnetic and  $Z^0$  fields simultaneously.

In many-sheeted space-time framework also the cavity resonances associated with the space-time sheets of Earth and Earth's inner and outer core plus possible other substructures such as ionospheric cavity and the thin cavities defined by boundary layers must be considered since the matter is at the atomic space-time sheets and the space-time sheets in question are practically empty of particles and could be super-conducting. Effective surface resonances have higher overall frequency scale (by the classical counterpart of Uncertainty Principle) than interior cavity resonances. Schumann resonances (for a detailed treatment see the appendix) are almost surface resonances because the surface layer involved is so thin. Also a well-defined dimensional reduction can occur. For Schumann cavity the lowest frequency is 10.6 Hz, which is essentially the frequency of the alpha peak and quite near to the basic frequency of the memetic code.

The hierarchy of space-time sheets would thus correspond to the hierarchy of potential resonance frequencies in EEG corresponding to the radii of Earth's inner core and outer cores, Earth's radius, ionosphere, the size of the magnetosphere, the sizes of the structures in the magnetotail, etc...

#### Schumann resonances and resonances associated with inner and outer core of Earth

Schumann resonances are usually identified as cavity resonances associated with the cavity between Earth's conducting surface and the lower boundary of ionosphere. Also in TGD cavity resonances should be very much like the resonances for the ordinary Maxwell fields. Coupling of MEs with Schumann resonances provides a possible manner to achieve amplification even when the length of ME does not satisfy the resonance condition.

The nominal values of the Schumann resonance frequencies are 7.8, 14, ...39, 45, ... Hz and many of these frequencies are important resonant frequencies of EEG which suggests that this amplification mechanism is indeed utilized. Numerical estimates demonstrate that radiation belts

containing the ring currents are especially interesting seats of representations amplified (also) by Schumann resonance. Dipole approximation for the magnetic field should be reasonable at the distance corresponding to the maximum of the ring current. Flux maxima are also good candidates for seats of sensory representation.

1. The flux maximum for the protons in the inner belt is at  $2R$ . The cyclotron frequency of proton is 37.5 Hz at this distance and corresponds to the lower limit of 40 Hz thalamocortical resonance band and is quite near to Schumann frequency 39 Hz. Note that in this case the resonance condition based on the length of ME can be also satisfied.
2. At the outer electronic belt extending to  $6R$  electronic ring current dominates and is maximum at  $4R$ : the cyclotron spin flip frequency for electron scales which is 902 Hz for  $B = .5$  Gauss scales down to 14 Hz, which corresponds to sleeping spindles, sensorymotor resonance frequency, and to the second Schumann resonance, and is also near to the endogenous  $Na^+$  cyclotron frequency 13 Hz. In the electronic case the distance condition is not possible to satisfy unless the representation is realized at the other side of the globe. Note that sleeping spindles could also correspond to control action (now lullaby!) exercised from the outer radiation belt.
3. Also the endogenous cyclotron frequencies sufficiently near 7.8 Hz could be represented as protonic cyclotron transition using Schumann resonance. The lowest Schumann resonance is probably relevant for hypnagogic states. Personally I sometimes experience during hypnagogic periods what it is to be quite another person. If Schumann resonance is in question, the interpretation would be that magnetic Mother Gaia experiencing us as sub-selves and sharing of mental image is in question. T

The distance for 7.8 Hz protonic cyclotron frequency is  $3.4R$  in dipole approximation whereas the length of ME would be  $6.3R$ . For the representation at the opposite side the distance would be below  $5.4R$  so that Schumann resonance is the only possible manner to achieve the amplification. For the third harmonic of the protonic cyclotron frequency the lower bound for the resonant amplification by ME is 8.6 Hz and rather near to the lowest Schumann resonance. The absence of the resonant amplification by projector ME wave cavity could explain why hypnagogy is unmasked only when the sensory input is absent. Note that the biologically important ions  $K$  and  $Cl$  have cyclotron frequencies near the lowest Schumann resonance.

In many-sheeted space-time also the cavity resonances associated with Earth's inner and outer core could be important. For the inner solid core of Earth having radius of 1200 km the counterpart of the lowest Schumann frequency is 41.4 Hz. The outer liquid core has radius 2900 km and in this case the lowest Schumann frequency is scaled up to 14.3 Hz, which is near to the sensorimotor resonance frequency and sleeping spindle frequency. Both of these frequencies are important resonance frequencies in EEG (and should be so in ZEG) and almost coincide with Schumann frequencies. Even more, the mantle above the outer core divides into two parts. The boundary is at the depth of 1000 km: the corresponding cavity frequency is 9.25 Hz and in the accuracy used equal to the lower bound of  $Z^0$  cyclotron frequency varying in the range 9.3 – 11.4 Hz.

### Cavity resonances in the magnetic lobe

Various oscillation modes associated with cavities like the inner magnetosphere and entire magnetosphere could also serve as resonant amplifiers of the signals carried by the projector MEs involved with sensory representations.

In particular, lobe cavity with length  $L \sim 10^3 R$  gives rise to electromagnetic oscillation modes in the direction of the lobes with the spectrum of frequencies having fundamental frequency of about  $f = c/L = c/10^3 R \sim 49$  mHz. A repeated reflection between magneto-pause and magneto-tail ( $r \sim 20R$ ) would give resonance frequency 2.45 Hz whereas the repeated reflection between the opposite sides of magneto-pause ( $r \sim 40R$ ) would give 1.23 Hz resonance frequency. These are of course only rough order of magnitude estimates. These modes might be involved with the amplification of the frequencies in delta band.

The frequencies of the night side auroral Pc5 pulsations are quantized as multiples of 0.9, 1.3, 1.95, 2.6, and 3.3 mHz [F12]. They have been interpreted as field line excitations (FLR)

excited by quantized compressional modes. TGD inspired explanation for the Pc5 pulsations would be following. The reconnection process excites the Alfvén waves associated with the flux tubes of the solar magnetic field. The distance to the Sun is  $L = 8$  light minutes, that is  $L = 2.9 \times 10^{11} R$ . The fundamental frequency is  $f = c/L = 1.1$  mHz and indeed of the same order of magnitude as the frequencies assigned with the compressional modes. If compressional waves are there, they could excite the FLR excitations of the solar magnetic field or vice versa. If solar magnetosphere is conscious self it could control Earth magnetosphere by exciting these modes (solar magnetosphere is known to have “memory”: the complex magnetic structure returns to the original one after 11 year sunspot period [E6] ).

### Delta band cavity resonances and epilepsy

Sferics are electromagnetic excitations associated with lightnings. Some authors define the frequency spectrum of sferics roughly  $20 - 2 \times 10^4$  Hz, which corresponds to the range of audible frequencies (this is perhaps not an accident). Some authors define sferics as the frequency range  $0 - 2 \times 10^4$  Hz.

The spectrum of sferics defined in the latter sense has a maximum at 3 Hz and spectrum resembles EEG spectrum in this region. A possible interpretation of the delta band peak is in terms of the cavity resonances. The general scale of the inner magnetosphere is about  $4R$  so that one would expect by scaling from Schumann resonance frequency  $f \sim 7.8/4 = 1.95$  Hz for the fundamental frequency. Also the previously mentioned resonances with frequencies are 1.25 Hz and 2.5 Hz (rough estimate) associated with the radial degrees of freedom inside magneto-tail contribute to delta band. Since the plasma sheet becomes thicker and the magneto-tail gets thinner near Earth, one expects that the fundamental frequency increases for the local reflection modes from the rough estimate 2.5 Hz so that also 3 Hz frequency should belong to the spectrum.

These cavity resonances could amplify delta band around 3 Hz. That petit mal begins with the amplification 3 Hz EEG rhythm might relate to the resonant amplification by sferics. For proton 3 Hz corresponds to  $r = 4.6R$  and for electron to  $r = 6.7R$  and resonance condition for ME gives the distance  $d = 16R$  which is in the outer magnetosphere. Here higher harmonics of proton cyclotron frequency would allow a resonant amplification. A loss of consciousness could result from the entanglement of entire self. The alternative option is that only mental image is entangled so that consciousness is not lost but that there is no memory representation about the conscious experience during the epileptic seizure (the situation would be same in the case of sleep state).

## 2.5 The Hierarchy Of Magnetospheric Representations

In the sequel magnetospheric representations and their interpretation are discussed in a more detail. The basic vision is that a hierarchy of selves extending up to the scales of lightlife can contribute to our own conscious experience. The mechanism generating sensory and motor representations would be the intersection of the magnetic mirrors associated with the personal sensory canvas with various magnetic flux tube structures of the magnetosphere. An essential correction to the earlier representation is that the frequencies correspond to  $B_{end} = 2B_E/5$  ( $= .2$  Gauss at Earth surface) rather than the Earth’s magnetic field  $B_E$ . There reasons for this are explained in the introduction.

### 2.5.1 EEG And Magnetospheric Sensory Representations

Resonance condition at lowest order gives extremely strong restrictions on sensory representations. These conditions become even more stringent if one assumes that only the fundamental frequency  $f = c/L$  of ME projector is of significance. The **Table 2.1** gives an overall view about how the frequency depends on the length of ME and allows to understand the implications of these conditions. An especially interesting consequence of the resonance condition is that audible frequencies must be represented inside brain as features and entangled to the sensory magnetic canvas rather than being directly coded to em or  $Z^0$  frequencies.

$x = d/R$	1	2	3	4	5	6	8	10	60	$10^3$
$f/Hz$	49.0	24.5	16.3	12.3	9.8	8.2	6.1	4.9	0.8	.05
$y = r/R$	1	2	3	4	5	6	8	10	60	$10^3$
$f_p/Hz$	300	37.5	11.1	4.7	2.4	1.4	0.06	0.06	0.06	0.06
$f(e)/Hz$	902	112.8	33.4	14.1	7.2	4.2	0.18	0.18	0.18	0.18
$f_e(Z^0)/Hz$	707	88	26	11	5.7	3.3	0.14	0.14	0.14	0.14

**Table 2.1:** The first two rows give the dependence of the fundamental frequency  $f = c/d$  of ME projector on its length  $d$ . The next rows give the dependence of of proton's cyclotron frequency  $f_p$ , electron's cyclotron spin flip frequency  $f(e)$ , and electron's  $Z^0$  cyclotron frequency  $f_e(Z^0)$  on the distance  $r$  from Earth's center. On outer magnetosphere the consideration is restricted to the plasma sheet. Earth's magnetic field of 10 nT is assumed in the plasma sheet above  $r = 8R$  and below this distance dipole approximation neglecting polar angle dependence is used. Cyclotron frequencies are calculated for endogenous magnetic field  $B_{end} = 2B_E/5$ : the reasons for a little bit strange representation are discussed in introduction.  $Z^0$  magnetic field is assumed to be related to magnetic field by scaling  $g_Z B_Z = eB/16$ .

### Magneto-tail represents delta and theta bands

If the higher harmonics of the fundamental frequency  $f = c/L$  of ME are *not* significant, one can deduce following conclusions about the representations in the magneto-tail.

1. The range of frequencies representable for projector lengths  $d < L_t = 60R$ , where  $L_t$  corresponds roughly to the distance to the tip of the plasma sheet (neutral point), contains frequencies between  $f_{min} = .8$  Hz and  $f_{max} = 8.1$  Hz and thus covers delta and theta bands. Perhaps it is not a mere accident that  $f_{min}$  defines a natural lower boundary of the delta band.
2. The lowest frequency representable inside the magneto-tail ( $r < 10^3R$ ) is  $f_{p,tail} = .049$  Hz which corresponds to a period of 20.4 seconds:  $f_{p,tail}$  is rather near to the protonic cyclotron frequency  $f_p$  inside plasma sheet.
3. Higher harmonics of  $f_p$  can be used to widen the representational repertoire at distances, where  $f > f_p$  condition holds true. The  $n$ : th harmonic of  $f_{p,tail}$  defines an octave wide representation and distance  $r_n = r_{max}/n$ . Same applies to the harmonics of the electronic  $Z^0$  cyclotron frequency  $f_{e,tail}(Z^0) = .14$  Hz.
4. The frequencies which are lower than  $f_{tail}$  must be represented as magnetic transition frequencies in the heliosphere. Most naturally at the night side, where the solar magnetic field weakens with distance.

### Inner magnetosphere represents alpha, beta and gamma bands

The lowest frequency representable inside the inner magnetosphere ( $r \leq 4R$  at the day side,  $r \leq 6R$  at the night side) is 12.5 Hz at day side and 8.6 Hz at night side: theta and delta bands are excluded at the night side and at the day side also alpha band is excluded.

By applying the constraints for the representations at the same and opposite side of the globe to the electronic case one obtains the following results: also proton and  $^4He$  are included for the sake of comparison.

The allowed electronic frequency bands and higher protonic cyclotron bands are rather narrow. For  $Z^0$  cyclotron frequency higher harmonics allow to reduce the lower bound but  $n > 3$  harmonics lead out of the inner magnetosphere. Even harmonics are expected to define much weaker cyclotron quantum phase transitions because of parity conservation in lowest order. The only exception is formed by frequencies near the maximum frequency 902 Hz *resp.* 707 Hz representable locally:  $d \sim 300$  km  $\ll R$ . For  $Z^0$  electronic representation also harmonics can be represented.

$f$	$f_d/Hz$	$f_u/Hz$
$f_p$	12.5	100
$f(e)$ and $3f_p$	8.6	18.8
$5f_p$	7.0	12.5
$7f_p$	6.1	10.0
$f_{He}$	15.8	75
$f_e(Z^0)$	9.4	25.0

**Table 2.2:** The allowed electronic frequency bands and cyclotron bands proton and  ${}^4He$ .

### Audible frequencies allow magnetospheric representation only if higher harmonics of ME projector frequencies are allowed

Mother Gaia should also hear and speak so that auditory experience should have representation at the sensory magnetic canvas and control of speech should be possible to some degree from magnetosphere. From the foregoing it is clear that the spectrum of audible frequencies does not allow resonant magnetospheric representation unless one allows higher harmonics of the fundamental ME frequency  $f = c/L$ .

The first possibility is that audible frequencies are represented as features inside brain and quantum entangled to the points of both magnetospheric and personal sensory canvases. Also motor representations provided by sensory canvases could be high level representations involving only frequencies below 26 Hz (roughly the limit of audible frequencies) and perhaps identifiable as internal speech. This idea conforms with the view that motor actions are like four-dimensional fractal statues carved quantum by quantum jump by adding further details in increasingly shorter time scales. TGD based quantum model for hearing indeed assumes a local representation inside brain based on “cognitive” neutrinos: the model predicts correctly the upper bound of audible frequency [E3] [K65].

The situation changes if higher harmonics for projector MEs are allowed. The range for audible frequencies is  $20 - 2 \times 10^4$  Hz. This frequency range corresponds to that of sferics [F7] and sferics might act as amplifiers of the signals between brain and  $Z^0$  sensory canvas.

#### 1. Place coding of frequencies of speech and sounds

Electron spin flip transition corresponds to frequency 33 Hz at  $r = 3R$  and varies up to 900 Hz below this height. This would suggest that electron spin flip might place code for the frequency range between 33 – 900 Hz. Also protonic spin flip,  $n = 3$  protonic cyclotron transition, and protonic spin flip plus cyclotron transition could be considered as translating sound frequencies to em frequencies in this frequency range.

Only the representations as electronic cyclotron transitions is possible above  $10^3$  Hz. Electronic cyclotron frequency is .564 MHz in the magnetic field of  $B_{end} = .2$  Gauss. The magnetic field  $B_{end} = 2B_E/10 = 4$  nT for  $B_E = 10$  nT at plasma sheet corresponds to a frequency of 112.8 Hz. At a distance of  $r = 8R$ , where plasma sheet begins, the frequency is 1.1 kHz. At  $r = 3R$  it is  $2 \times 10^4$  Hz. Thus the audible frequencies above kHz could be represented as electron cyclotron frequencies inside the night side inner magnetosphere at personal magnetic body with  $B_{end} = 2B_E/5$ .

From the foregoing it is clear that the frequency of 1 kHz is in a special role. This frequency is a remarkable frequency also in many other aspects.

1. The duration of single bit of the memetic code word is near to one millisecond.
2. The sound wavelength corresponding to 1 kHz is corresponds to the head size: above these frequencies sounds can be treated using geometric acoustics and below this frequency diffraction effects are important: for instance, the mechanism allowing to decide the direction of sound is different above and below 1 kHz.
3.  $\sim 1$  kHz is also the frequency neuronal synchrony.

### 2. Memetic code and speech

The harmonics of electron's  $Z^0$  cyclotron frequency could be involved with the motor control of speech. The same mechanism provides an alternative coding of speech frequencies below  $\sim 1$  kHz.

1. With the assumptions made about  $Z^0$  magnetic field ( $g_z B_Z = eB/16$ ), the representable range for  $f_e(Z^0)$  is (.14 – 707) Hz, if only the lowest cyclotron harmonic is allowed. These transitions might relate to the control of speech using memetic code. The resonantly representable frequency range (9.4, 25) Hz indeed contains memetic code frequency and  $r = 4.2R$  corresponds to the frequency 9.9 Hz: this distance corresponds to the maximum of the electronic flux.
2. All atomic (hydrogen atom forms an exception) and molecular  $Z^0$  cyclotron frequencies are in the range (9.4, 11.3) Hz in endogenous  $Z^0$  magnetic field. That the lower bound is same as for resonantly representable frequencies is to some degree a miracle.  $Z^0$  MEs from  $Z^0$  magnetospheric motor area could thus be responsible for the generation of speech. The fact that the cyclotron frequencies of all atoms and molecules are nearly identical might make possible effective amplification of  $Z^0$  signal in the body and head to internal speech and possible even real sound by  $Z^0$  piezo-electric effect. In accordance with the earlier speculations,  $Z^0$  MEs could be also responsible for internal speech which would be analogous to an imagined motor action.
3. The harmonics of  $\sim 10$  Hz frequency defining the duration of memetic codon are natural candidates for the frequencies appearing in the representation of the memetic codewords as fast amplitude modulation of the basic frequency  $\sim 10$  Hz. What this means that higher harmonics add a small ripple to the basic oscillation. The higher harmonics of the cyclotron frequency  $f_e(Z^0) \sim 10$  Hz up to  $126^{th}$  harmonic would provide the coding of the memetic code words of duration .1 seconds representing basic information units of speech (perhaps phonemes). The duration of a single bit is of order one millisecond and coincides with the typical duration of the nerve pulse. Actually the number of harmonics needed is vanishingly small as compared to the maximum number 126 since the number of phonemes is much smaller than the maximal number  $2^{126} \sim 10^{38}$ . Hence brain utilizes only vanishingly small part of the resources allowed by the memetic code.

What looks nice is that the difference between inner speech and actually heard speech would reduce to the difference between em and  $Z^0$  interactions. These considerations raise the question who is really expressing itself when I am speaking: me or Mother Gaia or some of its many sub-selves? To speak fluently is to let it go and it might be that magnetospheric selves are also expressing themselves when this happens.

### What the emergence of the oxygen belt could mean?

Interestingly, during the last decade two sub-belts have emerged inside the inner radiation belt [J3]. The first belt is electronic and at  $r \sim 2R$ . The second newcomer contains mainly  $O^+$  ions. If the  $O^+$  flux has maximum at  $r = 2R$ , this would mean the appearance of new strongly represented cyclotron frequency of about  $f_{O^+} = 2.3$  Hz for  $B_{end}$ , and perhaps a new delta band contribution to the magnetospheric consciousness (and perhaps even to our consciousness in some altered states).

Resonance condition cannot be satisfied for ME projectors from brain but could be satisfied for ME projectors from the magneto-tail so that one can imagine the possibility of radiative magnetospheric brain circuit connecting these two levels. Note also that cavity resonances inside magnetotail might serve as amplifiers of the cyclotron frequencies in delta band.

What makes the situation interesting is that DNA and presumably also mRNA sequences have a constant charge density [I20] so that the value of the cyclotron frequency does not depend on the length of the sequence. mRNA cyclotron frequency is very near to the cyclotron frequency  $f(O^+) = 2.3$  Hz of  $O^+$  ions at  $r = 2R$  as the following argument shows. The nucleotide pairs in DNA have atomic weights 260 (C-G) and 261 (A-T) and the average weight of the DNA triplet is  $A = 781$ . DNA and presumably also mRNA sequence has constant charge density of 5.88 charges per triplet [I20], which means cyclotron frequency  $f_{mRNA} = 2.26$  Hz in the field of  $B_e = .2$  Tesla.

This holds true irrespective of the length of DNA or mRNA. The question is whether a chart about active mRNA sequences might be generated to the  $O^+$  belt and provide kind of a 3-dimensional out-of-body hologram about organism.

### A little summary before continuing

For the benefit of the reader it is worthwhile to collect the basic consequences of the proposed model.

1. Inner “endo” -magnetosphere in principle allows representation of frequencies above 8.6 Hz, that is alpha, beta and gamma bands. The EEG spectrum in the range 12.5 – 100 Hz is resonantly representable using protonic cyclotron frequency in the inner magnetosphere, where dipole field approximation is reasonable. The third harmonic of the protonic cyclotron frequency allow to reduce the lower bound for the representable frequencies to 8.6 Hz which is near to the lowest Schumann resonance frequency. Representations come as conjugate pairs corresponding to the representations at the same and opposite side of the globe.
2. Theta and delta bands are representable in the plasma sheet using higher harmonics of cyclotron frequencies and representations are octave wide. This might explain why they are not involved with sensory representations directly conscious-to-us requiring strong intensity in order to be not masked by the sensory input. If non-sensory memories are represented by theta and alpha bands symbolically, this would also explain why memories are usually symbolic rather than concrete re-experiences. Only linear written language like representations by the harmonics of cyclotron frequency make sense inside lobes where the average magnetic field is constant. Symbolic coding could allow to achieve reliability even when the signals are too weak to yield sensory representations not masked by the background noise.
3. Electrons allow the representation of audible frequencies if the higher harmonics of the fundamental frequency of ME are allowed. The representation of audible frequencies at the level of brain using cognitive neutrinos and quantum entanglement is favored. This means also that communications and motor control from the magnetosphere should take place at frequencies which are in EEG range. Kind of high level commands would be in question and perhaps experienced as internal speech.

### 2.5.2 Do Magnetospheric Structures Correspond Directly To Brain Structures?

p-Adic fractality characterizes the long range correlations of real physics. p-Adic and real space-time sheets are glued together along common rationals, and typically p-adically short scale corresponds to long scale in the real sense and vice versa. Hence the p-adic local physics defined by the p-adic variants of the basic field equations would reduce the p-adic fractality of real physics to mere p-adic smoothness and continuity [K85]. This allows also a more precise view about the origins of p-adic length scale hypothesis.

If one takes seriously the origins of the p-adic fractality, the idea that magnetosphere could contain fractally scaled up representations of structures like brain, does not look so weird anymore. As a matter fact, infinite hierarchy of fractal copies of these structures are expected to be there and provide space-time realization for the universe as a hologram.

Protonic and electronic radiation belts [F14] are optimal candidates for the magnetospheric sensory and motor representations since the densities of protons and electrons are exceptionally high inside belts. The working hypothesis is that from our point of view magnetospheric sensory representations correspond to various kinds of memories (sensory and symbolic memories). Motor representation in turn would correspond to higher level motor control (motor imagination and motor skills).

Inner radiation belt is rather stable unlike the outer radiation belt and there is no night-day variation involved. Inner radiation belt is therefore optimal for the representation of sensory memories whereas outer belt is better suited for the representation of verbal memories using memetic code.

### What is the magnetospheric counterpart of the left-right asymmetry of brain functioning?

The decomposition of living systems into pairs of almost similar members such that the second member tends to entangle with the external world and the first member remains autonomous and un-entangled system is basic implications of TGD inspired theory of consciousness [K41, K74, K75].

This division of labor seems to occur already at DNA level in the sense that the apparently passive conjugate strand entangles whereas the strand busily expresses itself. At brain level this asymmetry corresponds to the left-right asymmetry. This asymmetry should have a counterpart also at the level of the magnetospheric consciousness and would mean that “right” and “left” magneto-hemispheres are magneto-anatomically different similar but the “right” one is more able to entangle.

Northern and southern lobes are indeed very similar magneto-anatomically and plasma sheet in the equatorial plane separates the northern and southern hemispheres also naturally. Plasma sheet could be a counterpart for the region through which the axonal bundles connecting left and right hemispheres run through: axons are now replaced with magnetic flux tubes. Frontal lobes would correspond to the magneto-pause at the night side and hindbrain would correspond to the day side.

There indeed exists a seed of a functional North-South asymmetry in the sense that the flux tubes of the solar magnetic field are antiparallel (parallel) to the magnetic flux tubes inside the lobe at the northern (southern) magneto-pause. This implies that reconnection process occurs asymmetrically. Since reconnection makes possible entanglement with helio-magnetosphere, this asymmetry might imply that either northern or southern lobe quantum entangles with the helio-magnetosphere with a higher probability.

### Magnetospheric counterparts of subcortical structures?

The identification of the counterparts for the structures of the middle brain can be based on the requirement that the typical EEG frequencies associated with a given structure are same as the cavity resonance frequencies of the magnetospheric counterpart.

#### 1. *Magnetospheric thalamus*

There are several good reasons for identifying the space-time sheet of Earth’s inner core as the magnetospheric counterpart of thalamus.

1. The characteristic property of thalamus is that it acts a neuronal relay station feeding sensory input to practically all parts of brain and receiving strong feedback. Since the magnetic flux tubes from the inner core of Earth can reach any point of the magnetosphere, the identification of the inner core as the magnetic relay station is uniquely fixed.
2. The space-time sheet of the inner core of Earth corresponds quite closely to 40 Hz cavity resonance frequency in accordance with the requirement that the counterparts of thalamus and primary sensory areas (protonic radiation belt) resonate at this frequency.
3. If the magnetospheric representations above ionosphere correspond to cortical representations, it would seem that the only possible identification for the magnetothalamus is as the inner core of Earth.

Magnetothalamus has even some nuclear structure in the sense that are two pairs of magnetic anomalies (Canada-East Siberia at northern hemisphere and Antarcitis-Brazil and southern hemisphere). This suggests that supra currents must have a crucial role in the transfer of information.

#### 2. *Magnetospheric basal ganglia*

Basal ganglia responsible for motor control correspond naturally to frequency of about 14 Hz, which is the basic sensorimotor beta rhythm. The space-time sheet defined by the liquid outer core has this frequency as cavity frequency. Note that the magnetospheric thalamus is topologically condensed at the magnetospheric basal ganglia. Therefore it is perhaps more natural to identify the brain structure in question as that containing thalamus and basal ganglia.

### 3. Magnetospheric pineal gland

Earth's mantle decomposes to two layers such that the sheet associated with the inner sphere has cavity resonance frequency 9.3 Hz. This frequency is the lower bound for the nuclear  $Z^0$  frequency defined by the duration of the memetic code word presumably involved with the symbolic representation of memories. Pineal gland seems to correspond to a frequency  $\sim 10$  Hz defining a biological clock and might correspond to the sphere defined by the inner layer of the mantle.

### 4. Magnetospheric limbic brain

Schumann frequency 7.8 Hz and its harmonics are associated with the space-time sheet of the entire Earth with ionosphere possibly included. Strong resonant input to the tertiary sensory and motor areas should characterize the counterpart of this brain structure. Perhaps a magnetospheric counterpart of hypothalamus, amygdala, and other parts of the limbic brain is in question. This identification is consistent with the fact that Schumann resonance has strong emotional effects.

### 5. Magnetospheric hippocampus

The lowest cavity resonance frequency corresponds to the top of ionosphere ( $r = 2R$ ) is 3.9 Hz. Hippocampus is characterized by the so called hippocampal theta ranging from about 4 Hz up to 12 Hz. Thus it would seem that hippocampus corresponds to the highest structure in the subcortical brain, which by definition contains also the structures below as topologically condensed space-time sheets, so that also higher cavity frequencies are included. A strong input to the association areas should characterize the corresponding brain structure and hippocampus indeed has input to the entire cortex.

## Magnetospheric counterparts of the sensory areas?

The next task is to identify the magnetospheric counterparts of the primary, secondary, and tertiary sensory areas of the cortex. These areas should correspond to a gradually decreasing frequency scale for resonant representations. The higher odd harmonics of cyclotron frequency indeed have this property (even harmonics couple weakly to cyclotron quantum phase transitions). For proton the two lowest harmonics have range above 8.6 Hz and correspond to the inner magnetosphere (with plasma sheet excluded).

The protonic inner radiation belt could define somatosensory representations of Mother Gaia such that single organism takes the role of neuron. Anatomically the protonic inner belt would correspond primary sensory areas. The primary sensory areas correspond to 40 Hz thalamocortical sensory representations and correspond to the maximum of protonic flux at at the inner belt. Here also 40 Hz cavity resonance associated with the inner core of Earth and analogous to Schumann resonance might help (note that Earth as conducting solid body exists only at the atomic space-time sheets!). That thalamus is regarded as a generator of 40 Hz resonance frequency conforms with this correspondence.

Secondary sensory and motor areas could define magnetospheric sensory representations covering frequencies down to 8.1 Hz defining the boundary of the night side inner magnetosphere. The decreasing density of protons poses a strong limitation. Schumann resonances could help to increase the intensity at the upper boundary of the protonic belt, where the protonic supra-current is weakest so that also alpha band could be represented. Hippocampal theta is only partially representable: the genuinely theta like part of the hippocampal theta must be represented in the plasma sheet.

Because of the low intensity of supra currents, the representations had better to be symbolic rather than direct images. The coding of EEG features with the duration varying in the interval determined by the range of alpha band by fast and weak amplitude modulation using harmonics of alpha frequency could code these representations. alpha frequency would code for the position and the higher frequencies would assign features associated with the lower level sensory canvases with this point.

Tertiary sensory and motor areas would correspond to magnetospheric sensory representations at the transition region between inner and outer magnetosphere. This region is just plasma sheet at the night side magneto-tail (, which is identifiable as the counterpart of the frontal brain). Plasma sheet defines an octave wide sensory representation for the harmonics of the protonic and

electronic  $Z^0$  magnetic frequencies. There are reasons to believe that the self representations in brain reside at the inner surfaces of the left and right brain hemispheres in frontal cortex (insula). This would suggest that plasma sheet which in a well defined sense is between internal and external world (rotating inner and non-rotating outer magnetosphere), is responsible for the magnetospheric self representation. This would also mean that plasma sheet is kind of a primus motor of the magnetosphere. This is consistent with the high level of self-organization (later the discovery about “features” represented in the plasma sheet [F11] will be described).

### **Plasma sheet and magneto-pause as counterparts of association regions?**

Associations and imagination represent higher level mentality than sensory experience. Sensory associations are generated at the junction OPT of occipital, parietal and temporal lobes whereas frontal lobes could be seen as the seat of highest level mentality like imagination and planning.

Magneto-pause is self-organizing unstable structure and thus ideal for imagination, planning and associations. Occipito-parietal-temporal association regions would be mapped to the day side magneto-pause and frontal association regions to the night side magneto-pause having much higher representative power (the frequency spectrum extends to much lower frequencies). Outer magnetosphere is in a direct contact with this region as are also tertiary sensory areas with various association regions so that the identification is consistent with the continuity requirement.

In the magnetic case day side (shorter cyclotron time scale) perhaps corresponds to sensory imagination whereas night side would correspond to symbolic memories. In the  $Z^0$  magnetic case night side would correspond to motor programs and day side to motor imagination. Communications between magneto-pause and plasma sheet could occur mainly via ME projectors since direct supra currents are not possible unless perhaps during magnetic storms and sub-storms. This is possible since cyclotron frequency scales are essentially same. Note that also entanglement between magneto-pause and plasma sheet making possible the generation of shared and fused mental images is possible. Hence plasma sheet is indeed an ideal candidate for the carrier of self model. Horizontal communications inside magneto-pause are made possible by surface (supra?) currents orthogonal to the discontinuity of the magnetic field.

### **2.5.3 How Do The Contributions Of Magneto-Tail And Inner Magnetosphere To Our Consciousness Differ?**

The study of the magnetospheric sensory representations leads to considerable insights concerning the differences between sensory, verbal, and motor memories, and imagination. An explanation for the distinction between sleep and awake emerges, and aging could be understood as a gradual shift of control from magneto-tail to the inner magnetosphere.

#### **The difference between sleep and awake**

Essentially entire EEG above 8.1 Hz is covered by the inner “endo” -magnetosphere. If the inner magnetosphere is responsible for daytime memories, one could understand why we do not possess memories from the period of sleep (we could be still conscious and the identification of plasma sheet as counterpart of self system in brain suggests this!). The dominance of the inner magnetosphere over the outer one should distinguish wake-up state from sleep state and the transition wake-up-to-sleep might be partially controlled by magnetosphere (sleeping spindles). During wake-up the dominance of the inner protonic belt over outer electronic belt would in turn distinguish high sensory alertness from a more inwardly oriented state. Non-autonomous and autonomous parts of the nervous system could correspond roughly to the inner and outer radiation belts. Autonomous system would be mostly unconscious to us because of the low density of protons and thus low rate of the cyclotron quantum phase transitions.

As already proposed, magneto-tail could correspond to frontal lobes and thus motor imagination and planning. This would mean that sleeping periods would involve kind of virtual world training of motor skills, which indeed seems very natural. Learned motor skills represent one type of memory and the magnetospheric electronic representations would have interpretation as this kind of memories. In  $Z^0$  sector magneto-tail would correspond to higher level control of speech

and verbal imagination: also speech faculties might be trained during sleep. Plasma tail would be responsible for the highest level of control as the magnetospheric self system.

### **Ageing as a gradual shift of consciousness from magneto-tail to inner magnetosphere**

Delta band gets weaker during aging and sleeping disorders increase during the old age. Delta band dominates in the EEG of infants and shifts gradually to become eventually alpha band. Thus aging could be seen as a gradual shift of the consciousness from the outer magnetosphere to the inner magnetosphere. That motor skills and speech develop by trial and error during the first years of life, conforms with the fact that motor consciousness must be highest during this period.

It would seem that aging means gradual stepping down along the ladder of consciousness and that Buddhist teachings about Karma's cycle might make sense in quite precise sense. This might be an illusion: the strong delta contribution in the EEG of infant could reflect strong higher level motor control and aging might mean learning to survive without the advice and control from this level. One could also see life as carving of a 4-dimensional statue and transition to the higher frequencies would mean concentration to increasingly finer temporal details.

The ability to generate new memories gets poorer during aging whereas childhood memories are rather stable. This is contrary to what neuroscience models for the long term memory tend to predict but in consistency with TGD based mirror mechanism. This difference does not relate to the assumptions of a particular model but to the basic philosophy about time.

Motor and verbal memory representations would be stored to electronic belts whereas sensory memories would reside in the inner protonic belt. Highest level memory representation in a form of self narrative would be stored in the plasma sheet.

In this picture one could understand why we do not have long term memories from the age before 4 years as being due to the absence of ME projectors needed to generate the magnetospheric memory representations. The shift of the control downwards in the magnetosphere could explain why the ability to generate new memories becomes poorer at the older age. During sleep we could enjoy magneto-tail consciousness but would remember what it is to be conscious during sleep only during sleep. Infants could be in this mode of consciousness all the time.

### **Magnetospheric consciousness evolves**

The strength of Earth's magnetic field has reduced by a factor of order two during the last thousand years whereas Schumann resonances must have remained same all the time. For  $10^3$  years ago the positions of the flux maxima have corresponded to frequencies which are twice the recent frequencies 37.5 Hz, 14 Hz, and 7.8 Hz. The ionic flux intensity at the distance corresponding to these frequencies has been weaker than today since the distance corresponding to these frequencies is scaled up by a factor 1.26. This might have had dramatic effects on the character of the magnetospheric consciousness and also to that of ours.

If sensory memories are represented protonically in the inner magnetosphere ( $r < 4R$ ), the increase in the intensity of the ionic fluxes involved with the memory representations could correlate with the development of science and the emergence of the high tech civilization. Also the vision of Jaynes [J17] about bicameral man who received commands and advices from collective levels of consciousness and gradually gained long term memory and self model during the last  $10^4$  years could be seen as a self-organization at the level of the magnetosphere, in particular as an evolution of plasma sheet leading to a magnetospheric model of self. This conforms with the fact that the anatomy of brain has not changed during this period appreciably and explains also the huge differences between chimpanzees and humans despite the fact that genomes are almost identical. An interesting question is whether the known temporary lowering of the temperature by several degrees for  $10^4$  years ago correlates with the magnetospheric dynamics and whether it might have initiated an evolutionary process in the magnetosheet with profound consequences.

### **Plasma sheet, imagination, dreams, and hallucinations**

It would be rather strange if brains would be out of use almost half of the lifetime. Rather, one would expect that the magnetic Mother Gaia uses our brains for information processing purposes during sleep. Imagination and the construction of self model is the most plausible guess

for the information processing involved. Dreams could be seen as sensory representations for this imagination.

It has become clear that dreams are cognitive activities involving frontal lobes in an essential manner. A considerable portion of dreams is known to be simulation of the situations encountered during the wake-up state. During daytime the information flow is dominantly from the sensory areas to the frontal lobes but during dreaming the direction is opposite. Brain stem makes dreaming possible but does not dictate the contents of dreams. Translating this to the level of magnetosphere one ends up with the conclusion that dreams and hallucinations are indeed communications from the magnetospheric self to the level of individual self. This view is completely consistent with the general vision of Jaynes [J17] formulated in TGD framework using the notion of semitrance (which is essentially sharing of mental images by quantum entanglement).

As opposed to the relatively high stability of the inner magnetosphere making it suitable for sensory and memory representations, the dynamics of the plasma sheet is rather unstable and self-organizing. This is indeed what imagination requires. The gradual loss of spontaneity and ability to imagine during aging could in this framework be understood as the gradual shift of the control from outer magnetosphere to the inner one. This would mean also gradual fixation of the self narrative when person “finds herself”: or equivalently ending up to an asymptotic self-organization pattern also at the level of local plasma sheet self-representation. Imagination should not interfere with sensory input and also this condition is satisfied in the plasma sheet.

Moon has also a magnetosphere, and during the period (three days), when the moon is inside the magneto-tail of Earth, the conscious magnetospheres of moon and Earth interact. Perhaps this interaction could provide a justification to the belief that the phase of the moon has strong effects on consciousness of some sensitive persons.

### Are the magnetospheric counterparts of brain circuits possible?

Brain is filled with circuits and there is a heavy feedback from cortex to midbrain and connections between various regions of brain. Also this circuitry should have a magnetospheric counterpart. Magnetic flux tubes define in a natural manner the counterpart of the neural circuitry (magnetic circulation should be present also in brain and represent the deeper quantum control level of neural signalling). Supra- and also ohmic currents running through, say, plasma sheet would provide a representation for their previous history. Even the quantum level counterparts of nerve pulses as solitons propagating along a pair of magnetic flux tubes connected by Josephson junctions realized as flux tubes are possible.

The supra currents emerging at Northern and Southern latitudes from the inner core, which is the magnetospheric counterpart of thalamus, are especially interesting since the flux tubes can lead anywhere in the magnetosphere. An interesting question is whether the leakage of ions in the polar regions could be somehow analogous to what happens when nerve pulse is transferred from neuron to another one. One can also wonder whether two parallel magnetic flux tubes with join along boundaries bonds/flux tubes between them defining Josephson junctions could carry soliton sequences associated with the phase difference of the super-conducting order parameters. These soliton sequences represent the deeper control signal giving rise to nerve pulse conduction in TGD based model of EEG and nerve [K66] [K66]. If so, then even the quantum counterpart of nerve pulse conduction might make sense at magnetospheric level.

The finding that plasma sheet indeed contains what might be called features [F11], supports the view that this kind of representation mechanism might be involved. Similar findings are predicted at magneto-pause. Supra current circuits would be optimal in this respect. Higher harmonics of proton cyclotron frequency generated by transitions in the plasma sheet and magneto-pause could induce the feedback to the inner magnetosphere and even the resonance condition  $f_m = c/L$  might be satisfied. This mechanism could also allow communications between various areas of the magnetospheric brain. The communication at 40 Hz frequencies between inner core and inner protonic radiation belt would be the magnetospheric analog of thalamocortical resonance.

Fractality inspires some speculations about the general structure of the magnetic circulation. For instance, does thalamus act as the magnetic dipole core of the nervous system? In particular, do the cortical neural loops from thalamus correspond to closed dipole lines at the day side and do the axons to the body define the thalamic counterparts of the magneto-tail? Do all nuclei of brain correspond to magnetic dipoles and does the neural circuitry follow field lines in reasonable

approximation?

### Plasmoids as living magnetic creatures?

Dipole type magnetic field is of course a huge idealization. For instance, plasmoids carry torus like magnetic flux configurations. In TGD Universe these structures could be regarded as higher level electromagnetic life forms. The flux tubes of magnetic field can form extremely complex knotted and linked structures. This topology provides almost enormous representational capacity and one can wonder whether the opportunistic Nature could really have failed to notice this opportunity.

Perhaps the simplest plasmoids (even ball lightning!) might be regarded as the magnetic counterparts of the simplest monocellulars. Note that small plasmoids should be generated also when supra-currents in bio-matter leak out from the magnetic flux tubes. Neural circuits might be accompanied by plasmoids responsible for the self-organization of the ordinary matter around them. Microwaves are effectively the “food” of plasmoids and if magnetic flux tubes carry a magnetic field of order .2 Tesla, the cyclotron transitions of electrons generate microwaves at the upper limit 2.4 GHz for microwaves hearing, so that these plasmoids could generate their “food” themselves. Sun has magnetic field of order .1-1 Tesla in the convective zone and might be ideal place for the plasmoid like life forms of this kind.

Also the dropping of ions from  $k = 151$  space-time sheet to larger space-time sheets generates microwaves (zero point kinetic energy), and this process is probably part of self-organization as suggested by the scaling law of homeopathy and the model of microwave hearing based on the scaling law  $f_h/f_l = c/v = 2^{137-k} \times 2 \times 10^{11}$  giving  $v = 6$  m/s for  $k = 151$  (alpha wave phase velocity at the surface of skull).

In many-sheeted space-time particles topologically condense at all space-time sheets having projection to given region of space-time so that this option makes sense only near the boundaries of space-time sheet of a given system. Also p-adic phase transition increasing the size of the space-time sheet could take place and the liberated energy would correspond to the reduction of zero point kinetic energy. Particles could be transferred from a portion of magnetic flux tube portion to another one with different value of magnetic field and possibly also of Planck constant  $h_{eff}$  so that cyclotron energy would be liberated.

Sun generates plasmoids, especially so during magnetic storms. plasmoids consist of closed magnetic flux tube structures and can be seen as conscious creatures leaving heliomagnetosphere and entering into the interstellar space. Also the plasma sheet of Earth’s magnetosphere generates plasmoids which would become thus magneto-ETs containing as its crew sensory representations about ordinary living organisms at Earth. Perhaps also solar plasmoid like structures could provide living documents about solar magnetospheric history and contain similar sensory representations. Sharing of the plasmoid mental images by quantum entanglement would make possible for the magnetospheres of Sun and Earth to extend their senses to the entire cosmos.

Also ET experiences might have interpretation as a sharing of mental images induced by encounters with the plasmoids generated during the tectonic activity. The visible pseudo UFO itself could be the plasmoid generated by the leakage of supra currents from magnetic flux tubes, when the flux tubes in the stream of magnetic flux from the spot of the tectonic activity reconnect with the flux tubes of the personal sensory magnetic canvas or with those of Earth’s magnetic field. Also genuine UFOs might be plasmoid structures emitted from the plasma sheet of some planet of a distant stellar system which have managed to penetrate through the cusp region of the magneto-pause of Earth, which serves as a magneto-immune system preventing the penetration of solar and other interplanetary magnetic life forms inside magnetosphere!

The somewhat ghostly crew of a magneto-UFO could consists of magnetospheric sensory representations for the inhabitants of this planet but this would not diminish the reality of the experience. Space travel of mental images would not require transfer of huge amounts of fuel through cosmos and light velocity would not be a limitation for the communications. There are good reasons to believe that higher levels of the self hierarchy have discovered mental space travel long ago if even we have been able to invent it!

There is however evidence for “metallic” UFOs too. TGD based model [K92] for the strange antigravity like effects observed in rotating magnetic systems [H22] leads to a mechanism which might be behind flying saucers. The basic idea is that the space-time sheet of rotating magnet is connected to the space-time sheet carrying Earth’s gravitational field by join along boundaries

bonds/flux tubes, one can visualize them as threads connecting the rotating system to the environment. Along these threads the gravitational flux created by the magnet flows to Earth's space-time sheet and these threads mediate the gravitational interaction.

Rotation causes the entanglement of the threads and when the rotational speed becomes high enough, the threads begin to split. This means that the ends of the split threads become carriers of negative and positive gravitational mass. Effectively the gravitational mass of the magnet system remains to the Earth's space-time sheet and the mass of magnet system itself decreases and angular momentum conservation implies an acceleration of the spinning motion (pirouette effect). If the inertial mass is equal to the gravitational mass as Equivalence Principle requires, one gets a system which is light as a feather!

One can wonder whether this could provide a mechanism making possible flying saucers. For instance, the rotating system could liberate some of its chemical energy to generate a very fast motion. It could also accelerate and change direction of motion very quickly. The strange properties of UFOs suggest that if they are really flying saucers, a reduction of the inertial mass is indeed involved. Thus one might think of the possibility that plasmoid like structure and a more rigid structure accompany each other in some cases. The rotating magnet system involves also plasma near its outer boundary and would in this case be due to acceleration of ions in radial electric field generate by the rotating magnet. Plasmoid like structures indeed involve magnetic flux tubes and this suggests that they could rotate rapidly and in this manner reduce their gravitational mass.

What about abduction experiences? Could they be mere quantum telepathy or do they represent real encounters with plasmoid like life forms? And what about the claimed Roswell case involving a "traffic accident" of UFO and dead bodies of aliens? The TGD based model for crop formations [K27, K28] suggests that parallel space-time sheet do not only carry supra currents but could be inhabited! Plasmoid like life forms would be much like ordinary life forms with DNA and proteins at magnetic flux tubes. The Chilbolton and Crabwood crop circles allow to even deduce rather precise information about the genetic codes of these life forms, and the second genetic code involves 80 DNAs and 23 amino-acids. This would mean that the civilization in question might be at a much higher evolutionary level that we are, and could have developed antigravity technology for long time ago. This forces to consider the possibility that abduction experiences are real interactions between life forms living at different space-time sheets.

### Plasmoids in laboratory

It seems that one of the most craziest predictions of TGD inspired theory of consciousness has been realized at laboratory. Quite recent report tells about plasmoids generated in a simple diode involving plasma generator creating plasma column between itself and the positively charged anode [I31]. The plasmoids are self-organizing structures able to evolve in a period of few microseconds. They possess many properties that life forms are expected to have. Plasmoids

1. grow from micrometer size up to cm size,
2. replicate by simply dividing into two pieces,
3. have an outer negatively charged surface separating the positively charged interior from the environment and obviously analogous to the cell membrane. Hence the plasmoid is analogous to a capacitor, and the exchange of matter with the environment could correspond to a dielectric breakdown essential for qualia in TGD based model of the sensory receptor,
4. possess a metabolic cycle involving the transfer of matter between the interior of the plasmoid and environment. This cycle is seen as a periodic generation of visible light at specific frequencies: the light balls are typically found to be red or yellow. The frequency of metabolic oscillations is at 25-45 kHz frequency range,
5. are able to communicate by generating electromagnetic radiation by inducing vibrations in the receiving plasmoid at the same frequency.

These findings give valuable hints concerning the more detailed modelling the "biology" of plasmoids. Plasmoids are in a key role in the TGD inspired model of pre-biotic evolution discussed

in [K33, K34]. For instance, one can ask whether the preferred colors might be interpreted in terms of quantized increments of zero point kinetic energies liberated when atoms or ions (such as C, N, and O) drop from the hot  $k = 131$  space-time sheets (temperature being of the order of the zero point kinetic energy) to larger space-time sheets.

### 2.5.4 Some Applications

Also applications provide tests for a theory and below some tests for the notion of magnetospheric consciousness are discussed.

#### Space traveller consciousness

The understanding of the basic facts about EEG on basis of resonance condition suggests that magnetospheric representations are there. The resonant magnetospheric representations cannot however be the whole story since this would mean spectacular effects on the sensory consciousness of space travellers. Long distance space travelling might be even impossible without dramatic effects for consciousness. The distance to the moon corresponds to  $d \sim 60R$  and in the interstellar space moon travellers should have experienced these effects. The fact that moon and space travellers have survived (although some of them have reported strange experiences and Edgar Mitchell has even founded Noethic Institute for the study of consciousness!) forces to consider the notion of resonance very critically.

The most realistic assumption is that our sensory representations are realized on personal magnetic bodies rather than that of Earth. This magnetic body would follow the space traveller. The representations at the magnetic sensory canvas defined by Earth's magnetic field are there but contribute mainly to the consciousness of the magnetic Mother Gaia and other higher level selves. These representations contribute also to our consciousness via the sharing of the mental images. The fact that  $B_{end} = 2B_E/5$  corresponds to the magnetic field strength explaining the effects of ELF em fields on matter supports this hypothesis.

Obviously, the study of consciousness of space travellers should provide valuable information about the importance of the magnetospheric contribution to the consciousness.

#### NDEs and OBEs

The distinction between out-of-body experiences and ordinary sensory experiences is a challenge for any model of sensory representations. Out-of-body experiences are associated with NDE experiences during which sensory input is absent and standard neuroscience suggest that brains do not contribute to the conscious experience. The characteristic aspect of out-of-body experience is third person aspect. This supports the naïve conclusion that personal sensory magnetic canvas is not responsible for OBES but that third person perspective involves entanglement with the mental image of the magnetic Mother Gaia about us. We would share the mental image of Mother Gaia about us. Even in the case that our personal sensory magnetic canvas ceases to exist, the magnetospheric representations would continue to exist. Also the deceased relatives encountered during NDEs could be magnetospheric mental images about them.

An interesting little sidetrack is perhaps allowed here. Stopping of breathing is the crucial step in the process leading to the physical death. The magnetic particles in lungs generate magnetic field with strength of order 10 nT: a magnetic field of same strength prevails also in plasma sheet and night side magneto-pause so that magnetic mirror communications at protonic cyclotron harmonics are possible between lungs and plasma sheet. The rhythm of breathing is in delta range which belongs to the range of frequencies representable in magneto-tail. Could it be that there are direct ME projections from plasma sheet to lungs at delta band and that the control of breathing involves these MEs and that the command leading to the physical death is sent from plasma sheet? Could it be that the "primitive" association of soul with breathing might carry some deep truth in it?

#### Relating the model to personal experiences

My personal altered states of consciousness have been a continual source of inspiration and challenge during the development of TGD inspired theory of consciousness. In the following I propose a model for the flow experience, which I have practically always when I close my eyes.

### 1. *The experience*

Especially inspiring has been the visual experience about complex background flow which becomes visible when eyes are closed. This experience does not seem to correlate with the sensory input although in light illumination the flow is brightly colored and the color varies in an unpredictable-by-me manner. The flow is most intense when I am in a calm state of mind and especially strong under creative periods of theory building. The flow contains in its “unexcited” state a “third eye” component, kind of a tunnel, to which the flow seems to converge. This sink can temporarily transform to a source. The disk like sink can also transform to a slit like sink. In a more aroused mental state the flow becomes very complex containing sources and sinks. The flow becomes also rotational: in particular, the flow whirls to the sink or from the source as a vortex.

I experience the background flow also at night time and there seems to be no sharp night-day difference. During night time immediately after wake-up I can also see very clear and beautiful organized abstract geometric patterns (like lattices) which vary very slowly. During my “great experience” the flow served as a background for vivid hallucinations. The hallucinatory contributions were superposed to the ordinary sensory input and these contributions were more or less independent from each other.

The complex, unstable background flow carries high resemblance to an incompressible hydrodynamic flow. Also magnetic field satisfies condition analogous to the incompressibility condition for the hydrodynamic flow ( $\nabla \cdot B = 0$ ). Hence the question has been whether this flow actually represents hydrodynamical flow, endogenous or exogenous magnetic field and supra current flow along its flux tubes, or whether it is a representation for a background neuronal activity which is usually not so strong.

### 2. *The explanation*

The most plausible interpretation for the experience is based on the observation that the background flow is best visible when eyes are lightly closed. This means that there is probably some amount of 40 Hz activity without definite sensory input and that alpha band dominates.

1. The flow represents alpha signal from the sensory canvas to brain mediated by Schumann resonances and is so weak because 40 Hz resonance is weak with closed eyes. The signal is masked by visual input when eyes are open. This mechanism explains also dreams and hallucinations as communications from various levels of magnetosphere via brain to the inner radiation belt and conforms with the semitrance model of bicameral consciousness.
2. The flow represents electronic supra-current flow running parallel to the magnetic flux tubes of the outer radiation belt. This flow could in turn represents the magnetic state of brain or body. The “third eye” contribution could represent the supra currents converging to the spinal cord. Or the vision could represent cortical magnetic flux tube structure converging to the thalamus serving as the basic dipole core of the brain’s magnetic field. Higher level selves might in fact represent it more or less automatically.
3. The presence of the hallucinatory component during great experience could be interpreted as additional communication from the magnetic sensory canvas via brain to the inner radiation belt. The simultaneous presence of both 40 Hz and alpha band vision would differentiate this period of a very intense brain activity from the experiences in which only alpha or gamma vision is present.
4. Also hypnagogic experiences which are sometimes transpersonal (I experience of being genuinely someone else) occur when alpha band dominates. This encourages to think that the amplification mechanism is based on Schumann resonance made possible by unusually strong coupling between magnetosphere and personal magnetic canvas: this coupling would become strong during creative periods. The correlation of the alpha band dominance with creativity is standard folk wisdom at least. Also this supports the view that communication from the outer radiation belt to brain and from brain to the first radiation belt is involved.

Besides the lowest 7.8 Schumann resonance also the second 14 Hz sleeping spindle Schumann resonance might be involved: I am often told that I have been sleeping when I have been sitting and thinking for a long time (I disagree strongly!). 14 Hz sleeping spindle Schumann

resonance corresponds to  $n = 3$  protonic cyclotron resonance and the electronic spin flip resonance at the electronic flux maximum  $r = 4R$  in the outer radiation belt.

5. The night time vision about highly symmetric slowly varying lattice like structures might in turn correspond to a situation in which the self-organization pattern in plasma sheet is projected to brain in theta or delta band and from brain to the first radiation belt. Also now the lattice like patterns in plasma sheet might represent the state of brain or body.

## Appendix

### 1. Schumann resonances

Schumann resonances [F9] represent resonant excitations of the Earth's electromagnetic field in the cavity defined by the spherical cell bounded by the Earth's surface and the lower edge of the ionosphere located at the height of roughly 100 km. The lowest Schumann resonance frequencies have nominal values 7.8, 14, 20, 26, 33, 39, 45 Hz with a temporal variation of  $\pm 5$  Hz.

It is often said that Schumann resonance frequencies characterize the cavity modes associated with the  $d \sim 100$  km thick spherical shell below ionosphere acting effectively as a waveguide bounded by Earth and ionosphere acting as conductors. This is not the case since the cutoff frequency for this waveguide would be in a good approximation  $f = c/d$  which is about  $f = 3$  kHz and much higher than Schumann resonance frequencies. The only manner to understand Schumann resonance frequencies is to assume that boundary conditions analogous to those used for half-open system, such as organ pipe. This amounts to requiring that the field modes vanish at the surface of Earth or the lower edge of the ionosphere but not both. Schumann resonances would be selected by a boundary condition stating essentially that the energy does not leak out from the system at the upper edge of the ionosphere.

It seems that the web contains a lot of confusion related to the Schumann resonances and the motivation to write my own view came with the realization that also my own understanding about Schumann resonance was rather misty. My sincere hope is that my unprofessional, TGD inspired ponderings do not increase the already existing confusion. The article "Schumann resonances and human psychobiology" by Richard and Iona Miller [J24] is recommended for a reader who wants to gain an overall view about various aspects of the phenomenon.

#### 1.1 Schumann frequency spectrum

Consider now the calculation of Schumann frequency spectrum by taking into account the finite thickness of the Schumann cavity neglecting the complications caused by spin of photon. For scalar wave equation the wave equation in radial variable for solution proportional to spherical harmonic  $Y_m^l$  reads as

$$\left[ -\partial_r^2 - \frac{2}{r}\partial_r + \frac{l(l+1)}{r^2} \right] F_l = \omega^2 F_l . \quad (2.5.1)$$

By writing  $F_l = G_l/r$  this equation can be cast into the form

$$\left[ -\partial_r^2 + \frac{l(l+1)}{r^2} \right] G_l = \omega^2 G_l . \quad (2.5.2)$$

The term proportional to angular momentum term varies very little in the thin Schumann cavity. Therefore it is reasonable to separate the constant part from the small variation by writing the equation in the form

$$\begin{aligned} \left[ -\partial_r^2 + l(l+1)\left(\frac{1}{r^2} - \frac{1}{R^2}\right) \right] G_l &= EG_l , \\ \omega^2 &= E + \frac{l(l+1)}{R^2} . \end{aligned} \quad (2.5.3)$$

Here  $E$ , playing the role of energy in the analog with Schrödinger equation, can be also negative implying that omega is below the alpha peak frequency for  $l = 1$ .

The Schumann frequency spectrum should be continuous since the only sensible boundary conditions correspond to organ pipe type boundary conditions requiring that the  $G$  vanishes at the surface of Earth (or, less probably at the lower edge of the ionosphere).

One can use the analogy with one-dimensional Schrödinger equation for particle with mass  $2m = 1$  ( $\hbar = 1$ ) and energy  $E$  at half-line  $r > R$  in order to understand the spectrum. The angular momentum term defines the potential function as

$$\begin{aligned} V(r) &= l(l+1) \left[ \frac{1}{r^2} - \frac{1}{R^2} \right] , \\ V(r) &= \infty \text{ for } r \leq R \end{aligned} \quad (2.5.4)$$

The potential function vanishes at origin origin and approaches to  $V(\infty) = -l(l+1)\frac{1}{R^2}$  at infinity. There are no classical bound state solutions since the force  $f(r) = -\partial_r V = 2l(l+1)/r^3$  drives the particle to infinity.

The spectrum satisfies the condition

$$\begin{aligned} E &\geq V(\infty) = -l(l+1)\frac{1}{R^2} , \\ \omega^2 &\geq 0 . \end{aligned} \quad (2.5.5)$$

In accordance with the expectation that the spectrum of Schumann frequencies is continuous.

### 1.2 The identification of Schumann resonance frequencies

In order to identify the Schumann resonances from the continuum one should apply some natural boundary condition. The vanishing of  $G$  at  $r = R + d$  is certainly not a natural condition. Schrödinger equation however suggests an analogy. The radial probability current is proportional to  $\partial_r G_l$ . In resonance this current should vanish at  $r = R + d$  so that one would have

$$\partial_r G(r)_{r=R+d} = 0 . \quad (2.5.6)$$

This condition determines the possible values of  $f$  for resonances. When  $d$  varies, also Schumann resonance frequencies vary. That the lowest Schumann frequency should be  $f_c = 1/(2\pi R) = 7.5$  Hz in a good approximation can be understood from the idea that in resonance ELF light rays move along geodesics of the sphere having length  $\lambda = 2\pi R$  defining the frequency as  $f_c = c/\lambda$ . This would suggest that at least the lowest Schumann resonance frequency does not appreciably depend on the thickness of the Schumann cavity.

### 1.3 Dimensional reduction of Schumann cavity to a sphere and alpha peak frequency

In the case radially very slowly varying modes dimensional reduction of the thin Schumann cavity to sphere occurs and wave equation reduces to that on sphere with radius  $R$  and the solutions are spherical harmonics. This allows to immediately write the frequency spectrum as

$$\begin{aligned} f_l &= \sqrt{l(l+1)} f_c , \\ f_c &= \frac{c}{2\pi R} . \end{aligned} \quad (2.5.7)$$

where  $f_c = 7.5$  Hz is the lowest Schumann resonance frequency and  $l = 1, 2, 3, \dots$ , characterizes the angular momentum quantum number of the spherical harmonic.

The following observations are rather interesting as regards to the interaction between magnetosphere and brain.

1. The lowest frequency of this kind corresponding to  $l = 1$  is  $f_1 = 10.6$  Hz. This is the peak alpha frequency and essentially the frequency of the memetic code! Note that this frequency does not depend on the thickness of the Schumann cavity at all. The lowest Schumann resonance frequency  $f_c \simeq 1/2\pi R \simeq 7.5$  Hz is by a factor  $\sqrt{2}$  lower than the peak frequency of alpha band.
2. The higher frequencies are  $f_2 = 18.4$  Hz,  $f_3 = 26.0$  Hz,  $f_4 = 33.5$  Hz,  $f_5 = 41.1$  Hz. The appearance of 26 Hz and 41 Hz, which are resonance frequencies of EEG, suggests a connection between alpha wave band and Schumann frequencies for almost radially constant modes. The comparison with the spectrum the spectrum 7.5, 14, 20, 26, 33, 39 Hz of Schumann frequencies shows that the two frequency spectra resemble each other.

alpha wave peak and possibly also higher peak frequencies of EEG spectrum could correspond to zero modes, which are very slowly varying with respect to the radial coordinate.

3. The cutoff frequency for genuine Schumann cavity solutions is  $f = c/d$  and for  $d = 100$  km one has  $f = 3$  kHz (note however that the values for  $d$  vary from 80 – 100 km. The time for the light ray to move forth and back in radial direction is .67 ms and only slightly shorter than the duration  $\tau = .78$  for the bit of the memetic codon. If the corresponding ME is parallel to curvilinear magnetic flux tube turning back at the lower edge of the ionosphere, the time is longer. This could easily explain the discrepancy.

#### 1.4 Coupling of the magnetospheric cavity modes with Schumann cavity frequencies

One can also consider the field modes associated with the space-time sheet representing a ball of radius  $R_1$  vanishing at the boundary. The solutions of the radial wave equation for  $F_l$  already written explicitly can be constructed in terms of spherical Bessel functions for which one can derive explicit expressions in terms of elementary functions. The lowest  $l = 0$  mode regular at origin is

$$F_0(r) = \frac{\sin(u)}{u} .$$

1. The vanishing of  $F_0(r)$  at the surface of Earth gives  $f_0 = c/R = 2\pi f_s$  giving  $f_0 = 47.2$  Hz. The lowest Schumann resonance frequency of the core-inner core boundary is around this value assuming that geometric argument holds true, and one can consider the possibility that a communication analogous based on the coupling between these modes is occurring.
2. It is also interesting to look for the cavity modes for the inner magnetosphere. The boundary of the inner magnetosphere is located in the interval  $[4R, 6R]$  which corresponds to the range  $[7.86, 11.8]$  Hz for  $f_0$  covering alpha band. For the lowest zeros of  $f_1$  and  $f_2$  the corresponding ranges are  $[22.5, 33.7]$  Hz and  $[28.8, 43.3]$  Hz. This suggests that discrete frequencies in alpha band and also higher EEG bands in Schumann cavity couple to the cavity modes associated with the space-time sheet of the inner magnetosphere. The erratic identification of this frequency as Schumann resonance frequency is possible. Also cyclotron frequency of proton at  $r \simeq 4R$  crucial for magnetospheric sensory representations is in alpha band.

This would imply a direct coupling between solar wind and brain: the solar wind would affect the size of the inner magnetosphere, in turn affecting the over all scale of the corresponding cavity frequency band in turn affecting the alpha band in Schumann cavity in turn affecting brain. Strong solar wind would compress the magnetosphere and tend to the discrete frequency in the alpha band. This could explain the negative effects of the solar wind on the mood of sensitive persons.

#### 1.5 Variation of the Schumann frequency with time

The measured lowest Schumann resonance frequency varies with time. There is a variation of  $\pm 0.5$  Hz but also claims about variation up to 11 Hz. The argument allowing to understand geometrically the lowest resonance frequency suggests that the varying thickness of the Schumann cavity does not affect the lowest Schumann resonance frequency. One can imagine several explanations for the claimed wandering.

1. Due to the coupling of the Schumann cavity modes to the modes associated with the space-time sheet of the inner magnetosphere (with radius varying in the range  $[4R, 6R]$ ) to be discussed below in detail, the wandering frequency identified as the lowest Schumann resonance frequency could actually be the cavity frequency of the inner magnetosphere. In this case quite wide variation range is possible.
2. The second option is that the boundary conditions stating the vanishing of field components fail to be satisfied at the surface of Earth. Physically this would mean the generation of an oscillating surface current and a surface charge density defined by the tangential discontinuities of magnetic and electric fields of the resonance modes. The simplest possibility is that there is a surface current parallel near to the surface of Earth with the rotational motion of Earth, which generates magnetic field discontinuity in the direction of longitudes and the discontinuity of electric field in the radial direction. This current would be oscillatory and might perhaps be seen as a parallel mirror image of the ionic current at the lower edge of the ionosphere of Earth: this real mirror current would cause Earth to effectively act like a conductor.

The lower edge of the Earth's crust at depth of 30-60 km is roughly a almost mirror image for the lower edge of the ionosphere and could be the seat of the mirror current. In the ideal situation the contributions of the two currents to the oscillating magnetic field at the surface of Earth would be of opposite sign and cancel but the variation for the height of the lower edge of the ionosphere would imply asymmetry, and the breaking of the standard boundary condition at the surface of Earth in turn changing the Schumann frequency.

## 2. Alfven waves, magnetic flux tubes, cosmic strings, and hadronic strings

In TGD framework Alfven waves correspond to the geometric oscillations of the magnetic flux tubes. The understanding of these oscillations represents a horrible mathematical problem and it is not even obvious that effectively massless modes are possible. It is however possible to understand magnetic flux tubes as a member of an extremely general family of solutions containing as special cases cosmic strings, hadronic strings and magnetic flux tubes. That Alfven waves would be mathematically very similar to the excitations of strings gives a glimpse about the mathematical beauties of the actual physics lurking behind such a simple looking thing as Earth's magnetic field.

One can in principle construct magnetic flux tube like solutions as deformations of cosmic string solution  $X^2 \times D^2$ , where  $X^2$  is any minimal surface and  $D^2$  is piece of the geodesic sphere  $S^2$  of  $CP_2$ . By allowing the  $M^4$  coordinates transversal to  $X^2$  to depend on  $D^2$  coordinates so that one has field theory in  $X^2 \times S^2$  with the transversal  $M^4$  coordinates taking the role of fields. A static flux tube is obtained when  $X^2$  is a piece of two-dimensional hyperplane  $M^2 \subset M^4$ . Thus an infinitely thin string representing projection to  $M^4$  spreads to a magnetic flux tube. The general stringy solutions  $X^2 \times D^2$  describe excitations travelling with light velocity along string. If the deformation inherits this property, one can say that the oscillations of the flux tube propagate with light velocity and  $f = c/L$  dispersion relation holds true apart from effects caused by the deviation of the induced metric from a flat metric.

Thanks to the progress in the understanding of the spectrum of the extremals of the Kähler action it is now possible to construct rather explicitly the deformations of "cosmic strings" to magnetic flux tubes. The construction demonstrates that the massless transverse modes of string indeed become Alfven waves [K10, K58].

## 2.6 Could brain be represented as a hyperbolic geometry?

There are proposals that neuronal systems in brain could have hyperbolic geometry [J10] (<http://tinyurl.com/ybghux6d>) in the sense that neurons could be mappable to a 2-D lattice like structure representable in terms of to 2-D hyperbolic geometry  $H^2$ . A concrete identification as a lattice-like structure in  $H^2$  would not be in question.

### 2.6.1 A concrete representation of hyperbolic geometry cannot be in question

The tessellations of  $P^2$  represented as Poincare disk have large density of points near the boundary. The concrete geometry of the cortex could very roughly correlate with the geometry of near the boundary of Poincare disk or even boundary sphere of 3-D Poincare ball representing 3-D hyperbolic space  $H^3$ . A rather abstract representation based on statistical properties of the network formed by the neurons would be in question. If a genuine geometric representation as a tessellation of hyperbolic space exist it must be realized somewhere else than brain.

To see what is involved, note that the line element of Poincare disk is given by

$$ds^2 = d\eta^2 + \sinh^2(\eta)d\phi^2 .$$

to be compared with the line element of ordinary disk given by

$$ds^2 = d\rho^2 + \rho^2 d\phi^2 .$$

For given neuron the size of the radial coordinate  $\eta$  of Poincare disk would correspond roughly to the number of connections it has, kind of popularity. For large values of radial coordinate  $\eta$  the circles of Poincare disk have radius proportional to  $\eta$  and circumference proportional to  $\sinh(\eta)$  increasing exponentially for large values of  $\eta$  whereas for ordinary disk both radial distance circumference would be proportional to  $\rho$ .

For the neurons of cortex, in particular pyramidal neurons, the image points would have large distance from the origin of hyperbolic space. The image points for neurons resembling each other would have small distance with respect to the angular coordinate of the Poincare disk. Since similar neurons can have large distances from each other at the level of brain, the representation must involve a map taking them close to each other.

### 2.6.2 Hyperbolic geometry and its tessellations

The standard representations for 2-D hyperbolic geometry are 2-D Poincare plane (<http://tinyurl.com/y8tnk1z6>) and Poincare disk (<http://tinyurl.com/y8bcd6cv>). Poincare disk is claimed to be natural representation space for the lattice like structure of neutrons. These lattice structures of  $H^2$  are known as tessellations.

**Remark:** There is a painting of Escher visualizing Poincare disk. From this painting one learns that the density of points of the tessellation increases without limit as one approaches the boundary of the Poincare disk.

The group  $SL(X)$ ,  $X = C, R$ , consists of matrices  $[a, b; c, d]$  with  $a, b, c, d \in X$  satisfying  $ad - bc = 1$ . The modular group  $SL(2, Z)$  acts subgroup of both  $SL(2, C)$  and  $SL(2, R)$ .  $SL(2, C)$  resp.  $SL(2, R)$  forms a double covering of Lorentz group  $SO(1, 3)$  resp.  $SO(1, 2) = SL(2, R)$ .  $SL(2, C)/SU(2) = SO(1, 3)/SO(3)$  defines 3-D hyperbolic geometry  $H^3$  realized as  $a = \sqrt{t^2 - x^2 - y^2 - z^2} = \text{constant}$  hyperboloid of future light-cone  $M_+^4$  having  $SO(1, 3)$  as isometries.  $SL(2, R) = SO(1, 2)$  acts as isometries of  $H^2$  realizes as hyperboloid of  $M_+^3$ .  $SL(2, C)$  resp.  $SL(2, R)$  acts as complex resp. real Möbius (conformal) transformations  $z \rightarrow (az + b)/(cz + d)$ ,  $ad - bc = 1$ , of complex plane resp. upper half plane.

The modular group  $SL(2, Z)$  acting as the subgroup of  $SL(2, R) \subset SL(2, C)$  consists of matrices  $[a, b; c, d]$  having integer valued elements satisfying  $ad - bc = 1$ . Alternative definition identifies the elements differing by sign ([https://en.wikipedia.org/wiki/Modular\\_group](https://en.wikipedia.org/wiki/Modular_group)) is a basic example of infinite discrete sub-group.

Modular group is representable as a free product  $Z_2 * Z_3$  with generators  $S$  resp.  $T$  subject to relations  $S^2 = I$  and  $(ST)^3 = I$ . Modular group has braid group  $B_3$  of 3 braids as a universal covering group. Modular group has an infinite number of congruence subgroups  $\Gamma(N)$  as subgroups. The diagonal elements of  $\Gamma(N)$  satisfy  $a \text{ mod } N = d \text{ mod } N = \pm 1$  and  $c \text{ mod } N = b \text{ mod } N = 0$  so that the matrices are equal to  $\pm I$  modulo  $N$ . There is also a hierarchy of subgroups  $\Gamma_0(N)$  for which matrices are upper triangular matrices modulo  $N$ .

In TGD one has also p-adic length scale hierarchy with preferred p-adic primes  $p \simeq 2^k$ . Therefore the groups  $\Gamma(p^n)$  are of special interest in TGD framework.

If replaces  $N$  with an extension of rationals, one obtains huge hierarchy of subgroups expected to be relevant in TGD framework. One can define the notion of integer also for the extensions of rationals. Algebraic integer is defined as a root of a monic polynomial  $P_n = x^n + \dots$  with integer coefficients. Also the counterparts of the groups  $\Gamma(N)$  can be defined, in particular those associated with  $N = p^n$ .

$H^n$ ,  $n = 2, 3$  allows infinite number of tessellations as left coset spaces  $G \backslash H^n$  of  $H^n = SO(1, n)/SO(1, 1)$ .  $G$  is here some infinite discrete subgroup  $G \subset SO(1, n)$  of  $SO(1, n)$  such as  $\Gamma(N)$ . For ordinary sphere  $S^2$  the analogs of tessellations are finite lattices and correspond to Platonic solids - tetrahedron, octahedron and cube, and icosahedron and dodecahedron. tessellations would therefore define hyperbolic analogs of Platonic solids.

The groups  $SL(2, Z)/Z_N$  are finite groups. For  $N = 3$  one obtains tetrahedral group and  $N = 5$  gives icosahedral group. Both groups play central role in TGD inspired model of genetic code [L3, L19] but their origin has remained unclear.  $\Gamma(N)$  is a normal subgroup  $SL(2, Z)$  so that the coset space is group too:  $SL(2, Z)/\Gamma(N) = SL(2, Z_N)$ . One can represent the elements of group algebra  $G(SL(2, Z))$  of  $SL(2, Z)$  as entangled elements in the tensor product of  $G(SL(2, Z)/\Gamma(N))$  and  $G(SL(2, Z_N))$ . Number theoretic state function reduction as a “small” state function reduction (SSFR) for elements of  $G(SL(2, Z))$  would project them to unentangled products of elements of  $G(SL(2, Z)/\Gamma(N))$  and  $G(SL(2, Z_N))$ . Maybe genetic code could relate with  $\Gamma(N)$  with  $N = 3$  and  $N = 5$ .

### 2.6.3 Could magnetic body provide a concrete geometric representation for the tessellation of hyperbolic space?

In TGD framework magnetic body (MB) having an onion-like structure and carrying dark matter as ordinary matter labelled by effective Planck constant  $h_{eff} = nh_0$ , where  $n$  corresponds to the dimension of extension of rationals serving as a kind of IQ. Various quantum scales, in particular quantum coherence length are expected to be proportional to  $n$  so that algebraic extensions of rationals define an evolutionary hierarchy with levels labelled by the dimension of extension. Space-time surface for given value of  $n$  can be regarded as a covering spaces with  $n$  sheets related by the action of Galois group of Galois extension acting as symmetry.

The question is whether one could generalize the hypothesis [J10] (<http://tinyurl.com/ybghux6d>) in TGD framework. In the sequel such a generalization replacing 2-D hyperbolic space with its 3-D counterpart and assuming that the hyperbolic tessellation is associated with MB of brain or of its subsystem considered. This generalization reduces to  $P^2$  if one restricts  $P^3$  to subspace  $P^2$  and restricts  $SL(2, C)$  ( $SO(1, 3)$ ) as symmetry to cylindrical symmetry  $SL(2, R)$  ( $SO(1, 2)$ ). Cylindrical symmetry is natural to magnetic flux tubes and cylindrical magnetic flux sheets so that  $P^2$  option might be more natural.

The notion of MB is extremely general and makes sense in all scales, and one can consider the possibility that the hyperbolic tessellations could provide a kind of universal for the MB of system responsible for cognitive representations.

### 2.6.4 Could regions of brain be mapped to tessellations of 3-D hyperbolic space defined by magnetic body?

The question is whether some 3-D lattice-like structures formed by neurons of brain or its subsystem could correspond to tessellations of 2-D or 3-D hyperbolic space  $H^3$  realization as cognitive representations at the MB of brain having hierarchical onion-like structure correlating with hierarchical structure of brain. The tessellation would be defined by an infinite discrete subgroup  $G$  of  $SL(2, C)$  such that elements are algebraic integers in the extension of rationals. The unit cells of the tessellation would be labelled by elements of  $G$  and would therefore define cognitive representation.

One can consider two basic options. Brain or its substructure as 3-D structure is mapped

1. either to a tessellation of  $H^3$  at which  $SL(2, C)$  acts as isometries,
2. or to a cylindrically to a tessellation of  $H^2$  at which  $SL(2, R)$  acts as isometries represented as upper half-plane or as Poincare disk where the action is as conformal transformation. One

can consider also mapping to a complex plane compactified to Riemann sphere at which  $SL(2, C)$  acts: now the action is however not as isometries but conformal transformations.

The interpretation could be in terms of symmetry breaking selecting time axis and spin quantization axis as direction of cylinder.

### Some basic facts

Consider first some basic facts about the possible role of 3-D hyperbolic space and its tessellations in TGD.

1. 3-D hyperbolic space  $H^3$  representable as hyperboloid  $t^2 - x^2 - y^2 - z^2 \equiv t^2 - r_M^2 = a^2$ .  $a$  has interpretation as light-cone proper time and in TGD inspired cosmology it corresponds to cosmic time. 2-D hyperbolic space could be seen as subspace of  $H^3$ . Now infinite discrete subgroups of  $SO(1, 3)$  would define tessellations as lattice-like structures. They would serve as 3-D analogs of Platonic solids. I have proposed [K49] that they could explain the astrophysical objects located along lines with redshifts coming as multiples of a basic redshift in terms of lattice-like structures in cosmic scales.
2. Brain region itself cannot correspond in any manner to a region of  $H^3$  represented as  $a = \text{constant} = a_0$  hyperboloid. MB of brain region might however do so. The mapping of brain region to the hyperboloid  $a = a_0$  could be mediated by gravitational magnetic flux tubes which can be radial since the Kähler flux vanishes in good approximation and there is no conserved monopole flux. Only the cognitive representation as discrete points in extension of rationals would correspond to points of the hyperboloid.

If MB participates in cosmological expansion assignable to CD, its size would scale up like  $a$  as also the cognitive representation associated with the tessellation, whose points would be labelled by discrete infinite subgroup  $G$  - say congruence group  $\Gamma(N)$  for extension of rationals. In ZEO this means that the part of tessellation inside CD would approach to the boundary of CD (or  $cd$ ). The finite size of CD would however prevent the expansion to values of  $a > T$ ,  $T$  is the size of CD define as the maximal radius of the intersection light-cones involved. It would also prevent MB from reaching the boundary of CD. One cannot therefore exclude cosmic expansion of MB.

3. One can challenge the assumption about cosmic expansion of MB. Quite generally, all known astrophysical objects participate in cosmological expansion by receding from each other as the cosmic redshifts show but do not experience cosmological expansion themselves. TGD solves this paradox by the assumption that cosmic expansion takes place as quantum phase transitions in which expansion occurs in rapid jerks, which correspond to reductions of length scale dependent cosmological constant  $\Lambda$  by a power of 2 if p-adic length scale hypothesis is accepted [L22].

There is evidence that even Earth has experienced this kind of expansion during Cambrian Explosion, which would have increased the radius of Earth by factor 2 [L16]. This would have been also a giant step in biological evolution as the multicellular life developed in the Earth's interior would have bursted to the surface of Earth and oceans would have formed. An interesting question inspired by the fractality of TGD Universe is whether one could see also the biological growth and development of organs and organelles as sequences of this kind of phase transitions.

This situation might hold true also for MB so that also it should evolve by rapid jerks as the value of  $\Lambda$  is reduced.

4. In TGD space-times are surfaces in  $M^4 \times CP_2$ . In zero energy ontology (ZEO) they are 4-surfaces in causal diamond (CD), where one has  $cd \times CP_2$ , where  $cd$  is diamond-like intersection of future and past directed light-cones.

For light-cone  $M_+^4$  one has a natural slicing is by using the hyperboloids  $a = \text{constant}$ . This slicing would define a natural time coordinate as analog of cosmic time. The usual linear Minkowski coordinates define a second natural natural slicing by  $t = \text{constant}$  sections, where  $t$  is the linear Minkowski time.

One can define the standard hyperbolic coordinates of  $M_+^4$  by the line element

$$ds^2 = da^2 - a^2(d\eta^2 + \sinh^2(\eta)d\Omega^2) .$$

$d\Omega^2 = d\theta^2 + \sin^2(\theta)d\phi^2$  is the line element of unit sphere  $S^2$ .  $\eta$  is the hyperbolic angle identifiable as analog of ordinary angle and having expression

$$\tanh(\eta) = \frac{r_M}{t} \equiv \beta$$

having an interpretation as velocity  $\beta = v/c$  in radial direction satisfying  $\beta \leq 1$ : one has  $t = a \cosh(\eta)$  and  $r_M = a \sinh(\eta)$ .

### About the precise correspondence between 3-D surfaces and $H^3$

What could the precise correspondence between 3-D surface giving rise to a cognitive representation of MB and tessellation of  $H^3$  be?

1. The space-time surface representing MB is not hyperbolic space itself but could in some sense have discrete subgroup of  $G \subset H^3$  as its symmetries: a possible interpretation would be as cognitive representations [L27, L20] consisting of points of  $H$  with coordinates in extension of rationals defining the adèle [L12, L11]. The lattice-like structure associated with 3-surfaces could be mappable to this kind of hyperboloid for some value of  $a$ .

Could the part of MB representing sub-system of brain in question be seen as an intersection of the with  $t = T$  section of  $M_+^4$  with the slicing of  $M_+^4$  by  $a = \text{constant}$  hyperboloids such that magnetic images of neurons as points of the tessellation of  $H^3$  defining cognitive representation would belong to the intersection? For  $t > T$  the 3-D structure would be preserved in good approximation.

2. The usual time=constant snapshot in  $M_+^4$  satisfying  $t = T$  intersects the hyperboloids with  $0 \leq a \leq T$ . The condition  $t = a \cosh(\eta) = T$  gives  $a = T / \cosh(\eta)$  so that  $a$  indeed varies in this range. This gives for the radial  $M^4$  coordinate  $r_M = a \sinh(\eta) = T \tanh(\eta)$  giving  $r_M \leq T$ .

It seems that this projection is 3-D analog of Poincare disk as a ‘‘Poincare ball’’ of radius  $r_M \leq T$  with at least analog of hyperbolic geometry. At least the density of intersections with hyperboloids increases as one approaches light-cone boundary since the density of hyperboloids increases.

3. A tessellation of  $H^3$  corresponds to the points  $\{(a \sinh(\eta_n), \Omega_n)\}$ . The lattice-like structure in  $E^3$  for  $t = T$  would correspond to points  $(r_M, \Omega)$  in  $\{T \tanh(\eta_n), \Omega_n\}$ . The difference from the representation hyperbolic geometry as  $H^3$  is that instead of  $r_M = a \sinh(\theta_n)$  for  $H^3$  one has  $r_M = T \tanh(\eta_n)$  for the analog of Poincare disk. For small values of  $\eta$  one has  $\sinh(\eta) \simeq \tanh(\eta)$  but not for large values so that  $E^3$  is compressed to Poincare ball  $B^3$ .

Neurons with large number of connections would correspond to points of tessellation with large values of  $\eta_n$  and similar neurons even if far away from each other would be mapped near to each other at spheres  $\eta_n = \text{constant}$  surfaces (spheres for  $H^3$  or circles for  $H^2$ ).

The discrete geometries for the magnetic image of neural sub-system as tessellations would naturally correspond to discrete subgroups of  $G \subset SO(1, 3)$  as analogs  $G \setminus H^3$  of Platonic solids. As found, there is infinite number of them and concordance groups  $\Gamma(N)$  one of special interest. One obtains also their 2-D variants as 2-D planar slices consistent with the symmetries just like one can have 2-D lattices as sub-lattices of 3-D lattices in  $E^3$ .

**Remark:** The elements of subgroup  $G \subset SL(2, C)$  for given extension of rationals provide natural coordinates for the unit cells of tessellation, and can be used instead of  $\{\eta_n, \Omega_n\}$ .

4. The system could have a finite size due to finite light-velocity if it has resulted in an event analogous to Big Bang like event (TGD predicts a hierarchy of cosmologies within cosmologies and cd is geometrically analogous to Big Bang followed by Big Crunch). This option does

not however look plausible at the level of visible bio-matter. At the level of MB this could be make sense and correspond to the emergence of a new onion-like layers to MB bringing in new scale of quantum coherence as CD.

In the case of MB one can estimate the  $T$  from the assumption that EEG corresponds to communications between brain and particular layer of its MB. Schumann frequency 7.8 Hz corresponds to wavelength of  $\lambda = 2\pi R_E$ ,  $R_E$  Earth radius. EEG alpha band is around 10 Hz and corresponds to a slightly shorter wave length lengths. If this frequency is realized as cyclotron frequency the corresponding part of MB should be of the order of Earth size. This would give  $R \sim R_E$  and  $T \leq R/c \leq .1$  s. The part of neuronal system considered could be the above described intersection corresponding to time  $t = T$ . After this no expansion would take place and the 3-D analog of Poincare ball would be preserved.

Note that if MB would participate in cosmic expansion, one would expect that the frequency scale of EEG scales down like  $1/a$ , which is not observed. Different bands of EEG could however correspond to different values of  $a = a_0$  defining different layers of MB.

The neuronal network has been assumed to be accompanied by flux tube network with flux tubes parallel to axons defining the “small” part of MB with size of order body size [L10, L15]. How the topology of this network correlates with the topology of the “large” part of MB with layers having size scales even larger than Earth size? Could the “small” networks at the level of biological body be representations of the “large” networks at the level of MB - or vice versa.

The higher level representations would re-organize the nodes of “small” flux tube networks by various criteria such as the number of connections to other nodes. Similar nodes - even distant ones - would correspond to points near to each other. Therefore similar neurons could be treated as coherent units with coherence induced from that at higher level. Synchronous firing would be the signature for nearness at the higher level. The hierarchy of layers of MB would perform basically classification of the objects of the system at the lowest level.

There is a huge number of possibilities for the cognitive representations corresponding to various values of  $N$  (in particular powers preferred prime  $p$ ) labeling  $\Gamma(N)$ , to hierarchy of extensions of rationals and the values of  $T$  possibly identifiable as roots of polynomials defining representation of layer of MB in  $M^8$ . Therefore one can hope that this vision could provide universal view about the anatomy of MB in relation to that of biological body (in very general sense).

### **The interpretation of the hyperbolic tessellations of neurons in terms of ZEO, $M^8 - H$ duality, and cognitive representations**

This picture suggests an interesting connection to TGD based view about quantum measurement theory [L28], which actually extends physics to a theory of consciousness. Causal diamonds (CDs) have a key role in ZEO and hyperbolic geometry is very naturally associated with them. The notions  $M^8 - H$  duality [L25, L24] could provide an explanation for the special value  $t = T$ , and tessellations could correspond to a particular cognitive representation [L27].

1. In zero energy ontology (ZEO) replacing ordinary ontology of quantum theory the notion of causal diamond (CD) plays a central role. CDs for a length scale hierarchy and CDs have sub-CDs. Space-time surfaces for given CD have ends at the upper and lower boundary of CD. In this picture the appearance of hyperbolic geometry at the level of MB would be very natural.
2.  $M^8 - H$  duality [L25] states that space-time surfaces could be regarded either as algebraic surfaces in  $M^8$  or as preferred extremals of action in  $H = M^4 \times CP_2$  reducing to minimal surface satisfying infinite number of additional conditions. Otherwise the consistency of dynamics in  $H$  dictated by partial differential equations with algebraic dynamics in  $M^8$  dictated by algebraic equations would not be possible.

One can say that space-time surfaces are roots of an octonionic polynomial obtained as an algebraic continuation of a real polynomial with rational coefficients to octonionic polynomial. This in the sense that either imaginary or real part of  $P$  in quaternionic sense vanishes and gives rise to 4-D surface in the generic case.

3. A special prediction of  $M^8$  picture is that besides 4-D surfaces as roots of algebraic equations also 6-D special brane-like solutions with topology of 6-sphere  $S^6$  are possible. For these solutions both real and imaginary parts vanish. These solutions have counterparts in  $H$ , and their intersection with  $cd$  is  $t = r_n$  ball, where  $r_n$  is the root of  $P$ .
4. I have called the moments  $t = r_n$  “very special moments in the life of self” identified as evolution of zero energy state of self by “small” state function reductions (SSFRs) as analogs of weak measurements. Also the size of CD increases in this process in statistical sense and corresponds to the increase of clock time as a natural correlate of subjective time defined by the sequence of SSFRs.
5. Could the state of neuron system at  $t = T$  correspond to  $T = r_n$  as a root of polynomial  $P$ ? Could these special moments correspond to rapid jerks in the cosmological expansion so that also the development of living organism would involve a sequence of them increasing the value of  $\Lambda$ . Presumably these jerks would occur at the level of MB and possibly induce those at the level of biological body. At the level of MB they could also correspond to a phase transition like events in the evolution of consciousness involving scaling up the size of MB.

To summarize, the tessellations of  $H^3$  or  $E^1 \times H^2$  suggest a universal cognitive representations realized at the MB of the system. One would have hierarchy of p-adic length scales and extensions of rationals giving rise to hierarchies of tessellations defining cognitive representations at corresponding layers of MB. Living matter would be only a special case. In living matter EEG would define important hierarchies of tessellations but also other frequency ranges would do so.

### 2.6.5 Empirical support for MB as a carrier of information about state of BB

If the view about hyperbolic brain and body is true, an abstract plan of brain and BB would be realized at MB. There are several findings supporting this view and in the following two examples are described.

#### Salamander recovers after shuffling of its brain

In the lab, the neurons of the brain of a salamander were shuffled like a pack of cards. The salamander however recovered and preserved its memories (identified as learned behaviors) [J27]. In [K62, K64] this finding was considered as a support for the view that the brain is analogous to a hologram (TGD Universe can be seen as a conscious hologram [K11]). It seems, however, clear that a single neuron cannot represent the information content of the entire brain. However, if memories are represented by the images of neurons at the level of the MB, the shuffling of neurons has no effect on memories as the experiment indeed demonstrated. Neurons would be analogous to RAM in computer science.

#### A chordate able to regrow all of its organs if dissected into three pieces

The popular article “Polycarpa mytiligera can regrow all of its organs if dissected into three pieces” <https://cutt.ly/SndWg81> tells about an extraordinary biological discovery.

The creature known as *Polycarpa mytiligera* is a marine animal commonly found in Gulf of Eilat that is capable of regenerating its organs. The surprising discovery was that the animal can regenerate all of its organs even when dissected into three fragments.

Such a high regenerative capacity has not been detected earlier in a chordate animal that reproduces only by sexual reproduction. In the experiment, the researchers dissected specimens in a method that left part of the body without a nerve center, heart, and part of the digestive system. Not only did each part of the creature survive the dissection on its own, all of the organs regenerated in each of the three sections.

This is highly interesting challenge for TGD. The information about the full animal body was needed for a full generation. How it was preserved in dissection? Was genetic information, as it is understood in standard biology, really enough to achieve this?

1. In TGD inspired quantum biology magnetic body (MB) carrying dark matter as  $h_{eff}/h_0 = n$  phases is the key notion.  $h_{eff}$  is an effective Planck constant defining the scale of quantum coherence.  $n$  is dimension of extension of rationals defined by a polynomial defining space-time region, and serves as a measure for algebraic complexity and serves as a kind of IQ. MB with high IQ defined by  $n$  serves as the master of BB controlling it and receiving information from it. The layers of MB also define abstracted representations of BB.
2. If BB suffers damage, the information about BB is not lost at MB and MB, which carries abstracted representations about BB and able to control BB, could restore BB partially. Healing of wounds would be the basic example. A more dramatic example about healing was discovered by Peoch: the neurons of the salamander brain can be shuffled like cards in a package but the animal recovers.

Indeed, since nothing happens to the MB of salamander or *Polycarpa Mytilera*, recovery is in principle possible. The new finding gives additional support for MB as a carrier of the biological information.

One can also make questions about the recovery process itself. Could recovery be seen as a self-organization process of some kind?

1. In the TGD framework, quantum measurement theory relies on zero energy ontology (ZEO) and solves its basic problem. The basic prediction is that in the TGD counterparts of ordinary state function reductions ("big" SFRs or BSFRs) time reversal takes place. In small SFRs (SSFRs) identifiable as analogs of "weak" measurements, the arrow of time is preserved. ZEO makes it also possible to understand why the Universe looks classical in all scales although BSFRs occur in all scales at the dark onion-like layers of MB controlling the lower layers with ordinary biomatter at the bottom of the hierarchy.
2. Time reversed dissipation after BSFR looks like self-organization from the perspective of the outsider with a standard arrow of time, called it briefly O, and would be a basic self-organization process in living systems. In dissipation gradients disappear but in time-reversed dissipation they appear from the perspective of O.
3. This makes possible also self-organized quantum criticality (SOQC), which is impossible in standard thermodynamics because criticality by definition means instability. The change of the arrow of time changes the situation from the perspective of O since the time reversed system tends to approach the criticality. Homeostasis would rely SOQC rather than on extremely complex deterministic control programs as in the computerism based picture. Change the arrow of time for a subsystem and let it happen. Very Buddhist approach to healing!
4. The change of the arrow of time would be also central in the healing processes and also regeneration.

## 2.7 DMT experiences and hyperbolic geometry

I received a link to a highly inspiring talk about a modelling of DMT induced experiences in terms of 2-D and more generally 3-D hyperbolic geometry. The title of the talk (see <https://zpr.io/7Bzbagjrk7LE>) was "DMT and Hyperbolic Geometry". The talk was by a person using the name "Algekalipso" and I understand that the person in question is Andres Gomez Emilsson. The organization in question is Qualia Research Institute (<https://cutt.ly/fG05D9W>). There is also article by Emilsson (<https://cutt.ly/YG05Qrk>) with essentially the same content.

### 2.7.1 Can one characterize DMT experiences by using temperature like parameters

The question posed in the beginning of the talk was whether there could exist parameters analogous to temperature allowing a general qualitative understanding of the nature of the DMT and more general psychedelic experiences. The proposal was that the DMT experience could be characterized by two parameters.

1. The first parameter characterizes how "hyperbolic" the visual field is and is identifiable as the curvature of the hyperbolic space. The idea is that during a DMT trip the experienced 3-space is not Euclidean but hyperbolic. This kind of geometry has been proposed as an effective statistical geometry of the brain in which functionally similar neurons distant from each other are close to each other [L32].

In the TGD framework, this effective geometry could correspond to a real hyperbolic geometry of 3-D hyperbolic space playing a key role in TGD and assignable naturally to the magnetic body (MB). Besides ordinary visual input also the projection of objects of  $H^3$  to the usual Euclidean space  $E^3$  would be experienced so that the experience would be "multiverse" experience.

In the TGD Universe, the space-times are minimal surfaces apart from singularities analogous to frames of soap films [L42] and their basic aspect is local saddle point property possessed also by hyperbolic spaces. Maybe DMT experiences make it possible to visually perceive 3-surfaces as objects in  $H^3$ . Also the usual vision corresponds to hyperbolic vision but with a small value of the  $H^3$  curvature.

2. The second parameter would characterize the complexity of the experience and could in the TGD framework correspond to algebraic complexity associated with the extension of rationals determined by the polynomial determining a given space-time region by  $M^8 - H$  duality [L29, L30].

The value  $h_{eff} = nh_0$  of the effective Planck constant, which can be larger than  $h$ , would correspond to the dimension  $n$  of the extension of rationals and serve as a universal IQ. Dark matter would correspond to phases of ordinary matter with  $h_{eff} \neq h$ .

As the IQ increases, the experience transforms from simple to complex and eventually chaotic since the experiencer is not able to make sense of it. Under some assumptions this would relate to the formation of Julia set type fractals.

The model also leads to a progress in the interpretation of TGD. In particular, a geometric interpretation of p-adic length scale hypothesis [K54, K46] suggesting that p-adic length scale is accompanied by much shorter length scale of order  $CP_2$  length scale finds an interpretation: p-adic length scale would correspond to the Euclidian scale defined by a hyperbolic length scale naturally emerging for hyperbolic tessellations.

### 2.7.2 TGD based model for DMT experiences

I have already earlier developed a TGD based model [L32] for the finding that the brain seems to obey an effective statistical geometry which is hyperbolic in the sense that neurons which are functionally near to each other have a short distance in this geometry. In the sequel a TGD based model for DMT experiences relying on hyperbolic geometry and based on the ideas already outlined is developed.

#### About hyperbolic spaces

First some mathematical background.

1. Hyperbolic 3-space  $H^3$  is a generalization of 1-D hyperbola of 2-D space-time as a curve defined by condition  $t^2 - x^2 = a^2$  but with its metric being induced from the 2-D Minkowski metric  $ds^2 = dt^2 - dx^2$ . By performing all possible rotations of this 1-D hyperbola one obtains  $H^3$ .
2. In particle physics  $H^3$  corresponds to mass shell  $E^2 - p^2 = m^2$  and in cosmology to cosmic time identifiable as  $a^2 = t^r - r^2$  in  $M^4 \subset M^4 \times CP_2$ .  $a$  defines Lorentz invariant cosmic time and is therefore analogous to absolute time invariant under Lorentz boosts which do not affect the tip of the light-cone. It is not invariant under translations however.

In the TGD framework  $H^3$  has a central role and plays a key role also in the model of the brain involving the notion of magnetic body (MB). One could say that cognitive and sensory representations are realized at the intersection of MB with  $H^3$ .

3. The value of cosmic time  $a$  characterizes the curvature of  $H^3$ . The curvature is proportional to  $1/a^2$  and the smaller the value of  $a$ , the larger the curvature and "hyperbolicity". As  $a$  decreases, one approaches the analog of the Big Bang with infinite curvature. As  $a$  increases, one approaches flat  $E^3$  in an infinite future. Cosmic evolution proceeds from the Big Bang to the future whereas DMT trip would be a travel towards the moment of Big Bang. One can of course ask whether trips could also be in the opposite time direction.
4. The lecture (see also the written version) contains a nice description of hyperbolic geometry. In particular, the volume of a ball in  $H^3$  increases exponentially as a function of its radius and this means that  $H^3$  has a lot of volume. This might be very relevant for memory storage. This can be easily understood from the visualization in terms of real hyperboloid.
5. The counterpart of plane  $E^2$  of  $E^3$  in  $H^3$  is 2-D hyperbolic space  $H^2$  and Poincare sphere gives a good view about what the projections of the tessellations of  $H^2$  look like when projected to  $E^2$ . The radial size for the basic unit of tessellations decreases with the distance from the origin whereas the region around the origin looks like  $E^2$ .  
Note that one particular tessellation, known as icosahedron-tetrahedron tessellation, plays a key role in the TGD based view about genetic code implied by the notion of bioharmony [L34], which relies on icosahedral and tetrahedral Hamiltonian cycles [L37].
6. The hyperbolic geometry  $H^2$  embedded locally in  $E^3$  has the saddle property meaning that in one direction the observer is at the bottom of the valley and in another direction at the top of the hill. This property has analog also at the level of abstract geometry: geodesic lines diverge very rapidly since the curvature scalar is negative: for spheres they converge.
7. By their negative curvature,  $H^3$  and  $H^2$  allow tessellations (analogs of lattices in  $E^3$  and  $E^2$ ) which are not possible in  $E^3$ . For instance, 7-polygons are possible. The number of tessellations is infinite whereas in  $E^2$  only 17 wall papers are possible.
8. Hyperbolic analogs of plants are mentioned as fractals.

### A possible interpretation of DMT experiences

DMT experiences could reflect both the relationship between the geometries of hyperbolic 3-space and Euclidian 3-space represented as 3-surfaces of Minkowski space and the algebraic complexity assignable to the tessellations of  $H^3$ .

#### 1. DMT trip as travel backwards in cosmic time

It was already mentioned that the proper time parameter  $a$  and algebraic complexity characterized by extension of rationals could characterize DMT experience. The increased complexity in turn means approach to apparent chaos since it is not possible to comprehend too high complexity. The following description is what I understood from the representation of Emilsson. I have not personally made DMT trips except spontaneously decades ago. This experience was so impressive that I got a passion to understand conscious experience from a quantum physics point of view.

1. For small DMT dose, the visual experiences correspond to patterns in plane  $E^2 \subset E^3$ , which can be regarded as plane  $H^2 \subset H^3$  for large value of  $a$  and thus small curvature.  
The lattices of  $E^2$  (17) called wallpapers serve as a background for the visual field. As if one would be perceiving two different worlds simultaneously. The lattices can be dynamical and pulsate. This kind of experience was part of the "Great Experience" decades ago.
2. As the DMT dose increases, the value of  $a$  decreases and one moves towards the Big Bang, so to say. In TGD and TGD inspired theory of consciousness, causal diamonds (CDs), identified as intersections of future and past directed light-cones, could be seen as correlates of perceptive fields [L28, L39] which in TGD are 4-D so that also memories could be seen as analogs of sensory perceptions. CD is analogous to a Big Bang followed by a Big crunch. The CDs form a fractal hierarchy.

The visual field becomes more and more hyperbolic. What we would see is the projection of the patterns of  $H_a^2 \subset H_a^3 \subset M_+^4$  to  $E_t^2 \subset E_t^3 \subset M_+^4$ , where  $a$  is cosmic time and  $t$  is the linear Minkowski time.

3. At the next step the 2-D patterns in  $H^3$  are replaced by patterns in  $H^3$  as hyperbolic analogous of curved surfaces in  $E^3$  and one can say that the dimension of the visual field becomes 3.
4. In TGD Universe space-time surfaces are minimal surfaces [L42] and analogous to 4-D soap films spanned by frames appearing as singularities where minimal surface property and also the determinism of field equations fail so that the frames are space-time correlates as seats of non-determinism. The saddle property of minimal surface could explain the appearance of the "hyperbolic plants" which Emilsson lists as part of DMT experience.

Do we really see a hyperbolic world or does the visual perception reflect only the statistical geometry of the brain? The TGD proposal is that these two views reflect real space-time surfaces. One can of course argue that since conscious experience itself is associated with quantum jumps in the TGD framework so that the experience is about becoming rather than about being in the physical sense.

### 2. Algebraic complexity of the experience as a second parameter

The second parameter discussed in the talk was meant to characterize what was called valence as a measure for the "degree of bliss" of the experience. TGD counterpart would be algebraic complexity associated with the extension of rationals defined by the polynomial defining the space-time region. The value of  $h_{eff}/h_0 = n$  as dimension of extension would serve as the parameter [L29, L30] For large values of  $n$  the situation becomes too complex to comprehend or remember and the bliss is lost.

In the TGD framework more complex systems can be engineered as functional composites of polynomials and this leads to the increase of  $h_{eff}$ . One can interpret this also as a construction of many-particle states with each polynomial, which represents a particle-like entity. When a fixed polynomial is iterated functionally, one obtains a fractal known as Julia set so that the connection with fractals is quite concrete [L33, L43, L44].

To sum up, the reports of Emilsson suggest a very concrete connection between DMT experience and TGD based views of space-time and number theoretical vision about quantum theory explaining dark matter as  $h_{eff} = nh_0$  phases. DMT perception would be perceptions of both ordinary and dark matter simultaneously.

## 2.7.3 Possible implications for the interpretation of TGD

The proposed picture involving in an essential manner both  $H^3$  and  $E^3$  suggests some highly non-trivial implications concerning the physical interpretation of TGD.

### $H^3$ is ideal for information storage and holography

The hyperbolic radial distance  $r_H$  in  $H^3$  from origin is given by  $r_H = a \operatorname{arsinh}(r_E/a) \simeq a \log(r_E/a)$ , where  $r_E$  is the Euclidean distance in  $E^3$ .  $r_H$  depends logarithmically of  $r_E$  slowly. The area  $S = 4\pi a^2 r^2$  of the hyperbolic sphere of radius  $u$  projected to Euclidean sphere with  $r$  increases as function of  $u$  as  $S \simeq 4\pi a^2 \exp(2u/a)$ . One can imbed a tree graph (say)  $m$  ranches in the node much more effectively than in the Euclidean case. One can think of the tree graphs a simple model for a neural network consisting of layers such that  $n$ :th layer has  $m^n$  nodes for

If a given node requires fixed area  $\Delta S$ , the solid angle  $\Delta\Omega$  required by a node decreases as  $1/r^2$  whereas in  $E^3$  it remains constant, the number of these areas at sphere increases as  $S/\Delta S = 4\pi \exp(2u/a)/\Delta S$ . In the Euclidean case it increases as  $S/\Delta S = 4\pi r^2/\Delta S$ . This means that the geometric information storage capacity of  $H^3$  is exponentially larger. Therefore the idea that the 3 surfaces associated with  $H_a^3$  could serve as information storage is very attractive.

### $H^3$ and the origin of p-adic length scale hypothesis

p-Adic prime assignable to a region of the space-time surface is identified as the largest ramified prime associated with the polynomial defining the region of the space-time surface. p-Adic length scale hypothesis states that the physical preferred p-adic primes correspond to p-adic primes  $p \simeq m^k$ , where  $m$  is a small integer:  $m = 2$  is the most important case.

I have proposed that there are two scales involved. The small p-adic length scale associated with  $m$  and the exponentially larger p-adic length scale proportional to  $\sqrt{p}$ . The origin of these scales has remained a mystery.

Could the small scales correspond to the radial scales  $r_H$  and large scales to radial scales  $r_E$ ?

1.  $H_3$  allows tessellations playing a key role in TGD framework and the size scale of the cell of the tessellation defines a natural length scale unit  $\Delta r_H = aX$ , which could define the small scale and scales would be expressible in terms of this unit.
2. In  $E^3$  the natural scale would correspond to Euclidean lattices with constant cell size  $\Delta r_E$ . For  $r_H = \Delta r_H$ ,  $r_E = a \sinh(r_H/a) \simeq a \exp(r_H/a)$  would give  $r_E \simeq a \exp(nX = am^{\Delta X/\log(m)})$ .
3.  $r_E = L_p = \sqrt{p}R$  would give  $\sqrt{p}R = am^{\Delta r_H \log(a)/a \log(m)}$ . p-Adic length scale hypothesis  $p \simeq m^k$  requires  $X = k \log(m)/2 \log(a/R)$ .

Note that there would be a logarithmic dependence of the p-adic length scale on the  $a$ , which would have an interpretation as a renormalization of the p-adic length- and mass scales.

## 2.8 Sensory hubs drift around brain although they should not

Sensory hubs (see <https://cutt.ly/dnDuKXk>) of the sensory cortex responsible for integrated brain function are found to behave in an unexpected manner (see <https://cutt.ly/DnDuJpz>). According to the textbook wisdom, sensory hubs responsible for sensory percepts should be static structures. Sensory hubs are however drifting in time scale of months. The phenomenon is called representational drift.

Sensory hubs are groups of highly connected neurons believed to be responsible for the integration of sensory experiences. They are present already from childhood and shift during childhood from the primary sensory areas receiving the sensory input from thalamus to the association areas. The connectivity strengthens, especially at frontal areas, from birth to adulthood. Note that also this shifting can be interpreted as a representational drift but in longer scale. Could this kind of evolution of the sensory hubs be present also in time scale of months and make the drift necessary?

### 2.8.1 The findings

The popular article describes some examples of representational drift. The odor specific sensory hubs found by the team led by Carl Schoonover and Andrew Fink to drift around the piriform cortex is the first example. The findings are described in the article is the first example. The findings are described in the article "Representational drift in primary olfactory cortex" [J31](<https://cutt.ly/MnDiCZx>).

1. It is odor specificity that drifts. Sensory hub is clearly like a moving vortex in a flow - moving self-organization pattern of water flow rather than moving water. The connection structure between neurons essential for the formation of associations as learning is drifting. The drift seems to involve learning, which cannot be induced by the ordinary sensory input. Could there be a "teacher" that provides virtual sensory input? Learning analogous to that encountered in AI comes first in mind.
2. In the case of odor perception studied for mice, daily sniffing slows down the drift. Why would the sensory input slow down or even prevent the virtual learning that seems to be present? Could the real sensory input interfere with the virtual sensory input?
3. Experiments using weak electric shocks to induce conditioning of neurons of the hub, show that the conditioning is preserved in the drift. Is it really neurons that are conditioned at the fundamental level? Could the conditioning takes place at some other, in some sense higher level?

Emotions are involved with conditioning. Who is the experiencer of these emotions? Does this higher level entity, kind of Mr. X, teach also the conditioning to the recruited neurons of the drifted sensory hub.

Interestingly, the analogy with dark matter is noticed by Schoonover and Fink. Maybe they suggest that something analogous to dark matter might be involved with living matter.

Also other examples are discussed.

1. Hippocampal place cells are mentioned as a second example. Motion of an organism from position A to B is represented by certain place cells of the hippocampus, which are firing during the movement. The locus of firing place cells drifts slowly. Standard neuroscience interpretation would be as an overwriting of memories. Mice moving in a T-shaped maze are mentioned as an example. The neuronal groups in the posterior parietal cortex involved with spatial reasoning are drifting.
2. Representational drift in the visual cortex is slower or not present. Could the slowness and possible absence be due to the more complex and precise organization? Or could it be due to the presence of a continual visual input interfering with the virtual sensory input needed for the drift?

However, for the mouse that watched the same movies over many days, the drift took place. Pan-psychist might imagine that the neurons or something else related to the sensory hub got tired or bored while seeing the same movie from day to day and became a poor perceiver so that fresh neurons had to be recruited?

### 2.8.2 Questions

These findings just describe raise the following questions:

1. How the representational drift is possible? The new neurons must learn associations and become conditioned. Ordinary sensory input cannot take care of this. Is there some kind of virtual sensory input from mysterious Mr. X present, which teaches the conditionings giving rise to specific sensory perceptions?  
How can the conditionings be preserved in the drift? Does this Mr. X also teach the conditionings to the recruited neurons by using virtual sensory input inducing them.
2. Why does the drift occur and what would cause it? Could the neurons of the sensory hub get "bored" and become non-alert perceivers so that new neurons must be recruited? Or could one think that serving as a hub neuron or its MB is hard work and also neurons or their MBs must have "vacation" and rest.
3. Why sensory input slows down the drift? Does it interfere with or prevent the learning process of the recruited neurons?
4. Could the analogy of drifting sensory hub with a moving vortex, self-organization pattern of flow, serve as a guideline? Note that incompressible hydrodynamical flow is mathematically highly analogous to a magnetic field. Could one see neurons as particles of an analog of hydrodynamic flow or perhaps its counterpart at the level of magnetic field?

These purposefully leading questions should make it easy for any-one familiar with the TGD based view about neuroscience to guess the TGD inspired model for the representational drift. Before introducing the model, some basic ideas about the brain in the TGD Universe are discussed.

### 2.8.3 TGD based view about representational drift

#### TGD view about sensory perception and emotions

The representational drift provides a new challenge for the standard dogma that sensory qualia are somehow constructed at neuronal level in the brain. There is also the problem that the neuronal stuff looks the same in all sensory areas: how could this give rise to so different sensory qualia.

Magnetic body (MB) defines the basic notion.

1. Magnetic body (MB) carrying  $h_{eff} = n \times h_0$  behaving like dark matter has IQ characterized by  $n$ , which is identifiable as a measure of complexity of an  $n$ -D extension of rationals associated with the polynomial defining a region of space-time surface assignable to MB [L29, L30].

$h = 6h_0$  is an assumption consistent with the findings of Randell Mills [L7] but it is quite possible that  $h_0$  can be smaller than  $h/6$ .

$n$  characterizes also the scale of quantum coherence at MB and this quantum coherence induces the ordinary (non-quantal) coherence of biomatter. By its higher IQ MB serves as a boss for layers of MB with smaller IQ and at the bottom of hierarchy is the ordinary matter with  $h_{eff} = h$ .

MB has an onion-like hierarchical structure and has both "small" parts with size scale of brain structure and "large" parts having size scale even larger than scale of Earth which corresponds to EEG frequencies around alpha band. Also highly connected neuron groups have both "small" MB and "large" MB. "Small" MB would have flux tubes parallel to axons and these flux tubes could induce the self-organization leading to the formation of axons and synaptic contacts.

2. The primary sensory qualia are at the level of sensory organs and the brain builds only cognitive representations (also secondary sensory representations not directly conscious to us are possible) and pattern recognition by receiving the input from the sensory organs and providing feedback as a virtual sensory input to sensory organs [L10]. REM dreams and hallucinations are a good example of a sensory experience due to mere virtual sensory input. Also imagination can be understood. The picture generalizes to the level of motor actions.

Phantom limb serves as an obvious objection: if the sensation is sensory memory this objection can be circumvented. Sensory memories can be produced by electrical stimulation of temporal lobes artificially.

3. In the TGD framework the sensory data are communicated to MB by EEG and its fractally scaled variants, where the fundamental representations reside. Communication by dark Josephson photons [K30, K69].
4. Neurons are analogous to RAM memory which is organized at the MB. Sensory perceptions are kind of artworks representing standardized mental images analogous to standard patterns in pattern recognition. The selection of neurons in sensory hub can be dynamical so that drifting is possible.

Neurons need not be even near to each other physically: it is enough that the data from the neurons contributing to the same subself are communicated near to each other at MB to form a quantum coherent structure.

There is indeed evidence that neurons in the brain obey an effective hyperbolic geometry determined statistically [L32]. Neurons functionally close to each other are near to each other in this geometry. Their images at MB would indeed be near to each other and this geometry would be hyperbolic as a geometry of hyperboloid of Minkowski space. One weird finding conforming with this picture is that salamander survives in a process reshuffling of its neurons [L32].

5. Sensory perceptions as standardized mental images created by a combination of a real sensory input communicated to MB and inducing as a response virtual sensory input from MB via brain to sensory organs as dark photons signals [L10]. This process is analogous to pattern recognition. Pattern recognition involves teaching period and MB could serve as a teacher.
6. Emotions are associated with conditionings and they would represent higher level sensory perceptions of MB and be essential for the conditioning. The "big" part of MB would be responsible for higher level emotions and "small" part for more primitive emotions like hunger and first essential for conditioning of neurons.

### The TGD inspired model model for the representational drift

The basic ideas of the TGD based model of representational drift should be rather obvious from foregoing.

1. Sensory hub is a higher level structure controlled by its MB. It is MB that experiences emotions as higher level sensory experiences by entangling with sensory organs and receiving sensory input also as dark photon signals. The highly connected flux tube structure of MB induces the neuronal connections of the sensory hub. Structural hubs are present from birth. Either the small MB of the sensory hub or its big brother would control the sensory hub by sending control signals and virtual sensory input.
2. Sensory hubs are present already in childhood. This suggests that standardized sensory mental images could be genetically determined and therefore inherited. This requires a realization of the genetic code at the level of MB.

The TGD inspired view about genetic code indeed predicts that genetic code is realized at the level of MB universally in terms of the tessellations of the hyperbolic 3-space  $H^3$  [L37]. Dark proton triplets represent genetic codons and also dark genes as higher level units are realized. Chemical realization would be a secondary representation mimicking this fundamental genetic code. Dark photon communications would be realized in terms of dark photon triplets and also now also dark 3N-photons representing genes would be realized as analogs of Bose-Einstein condensates.

Also basic emotional patterns could be genetically coded and inherited to some degree. This might relate to the epigenetic inheritance of moods. The TGD based model for the genetic code indeed leads to this picture. It should be noticed that in zero energy ontology (ZEO) not only structures but also temporal patterns (functions, behaviors) are inherited [L28, L38].

3. Representational drift requires that the connection structure for the neurons of a new hub is recreated by learning. Ordinary sensory input cannot generate the hubs with standardized sensory mental images at neuronal level.

Does MB as a boss teach standardized mental to neurons by using virtual sensory input just at it would do to induce standardized mental images? This would be analogous to teaching in associative learning used in AI.

4. Why does the drift occur? Why would MB recruit new neurons and teach them to produce standardized mental images?

Does something happen to the neurons of the hub such that drift becomes necessary? In TGD framework consciousness is universal so that one can ask what if I were a neuron of sensory hub. Could the MBs of neurons get bored or tired as I would do, and lose their alertness after experiencing the same mental images again and again? The notion of aging is a universal phenomenon in TGD view about life and consciousness [L81]: could the MBs of the neurons of the sensory hub begin to suffer from problems caused by aging?

The sensory hubs shift from the primary areas to the associative cortex during childhood and their connectivity increases. Could this mean some kind of personal evolution at the level of the sensory hub, analogous to professional at the level of human society.

To sum up, MB might be doing for the brain the same as we are now doing for robots, that is teaching them. Could our AI technology be an externalization of what MB is doing for the biological body?

## 2.9 Are we all artists?: or what my “Great Experience” taught me about consciousness

I could immediately answer the question of the title: we are artists - all of us. The construction of sensory mental images is not a passive process but a creation of an artwork, kind of caricature giving a representation of sensory input optimal as far as survival is considered. This means

decomposition of the sensory input to features and picking up the key features relevant for the survival.

This section is a written and slightly longer version of a talk in which I told about the role of vision in sensory experience seen in the theoretical framework provided by TGD inspired theory of consciousness. I decided to tell about my “Great Experience” around 1985 since it divides my life to two parts: life before and after this experience, and because this experience provided fascinating insights to consciousness and perception, not only visual, but also auditory perception and proprioception (body experience). I have told about this experience in my homepage (see <http://tinyurl.com/yccb73gq>) and in some material in books and articles to be found there (for instance).

There are online books about TGD proper (see <http://tinyurl.com/y89e3wn6>) and published books [K95, K5]. For TGD inspired theory of consciousness and quantum biology see the online books at my homepage (see <http://tinyurl.com/ycd318h1>) and the published book about consciousness and quantum biology [K2]. The article “Philosophy of Adelic Physics” [L11] explains the recent vision about the mathematics forced by consciousness theory.

### 2.9.1 The time before “Great Experience”

It is good to start from year 1977, say October. After running basic courses up to licenciate courses in theoretical physics, I had spent few years in a kind of Odysseia. I had a strange conviction that I would do something great and I was fully aware that telling this openly would raise eyebrows. Many young people have this kind of conviction and there is nothing bad in this. Academic environment however destroys this kind of dreams.

I had had several unsuccessful ideas but then everything changed. I really got the idea of century as was clear from the beginning. I had been pondering a problem related to General Relativity. The notion of energy is not well-defined. This is a simple fact that even first year student should understand but Einstein’s fully deserved authority is so huge that it is useless to try to explain the problem to an average colleague. Those who realize that the problem is real, say that gravitational interaction is so weak as compared to the other interactions that you can safely see this as a beauty spot of a marvellous theory. What adds to the irony, is that the classical conservation laws play a fundamental role in quantum field theory and gravitation has turned out to be a notoriously difficult to quantize. Even superstrings and M-theory failed to realize the dream. This should put bells ringing.

As a loner I was however not aware about what is socially suitable I saw nothing problematic in pondering this problem seriously. And then it came, the idea! For God’s sake, if space-times are 4-surfaces in certain higher-dimensional space the problem completely disappears. This space would be Minkowski space with points replaced with very small compact space. It soon turned out that this vision can be regarded also as a generalization of string model with strings (then hadronic strings then) replaced with 3-D surfaces (super-string theory came in fashion for 6 years later). It took two years to realize that the choice of the embedding space is unique from the condition that the standard model interactions (electromagnetic, weak, and strong) are obtained besides gravitation.

I was so convinced about the power of the idea that I marched to meet a professor and told that I have discovered an idea of of century! And also told that I would be happy to have a research position to continue work it. After two weeks I was told that my services it the department of theoretical physics of Helsinki University are not needed anymore.

I had to find some manner to fulfil the life mission that I had just identified, and I had good luck. I got a kind of unemployment job as an office worker in the Physics Laboratory of Technical High School. I was probably expected to become a good corporate operating citizen in this manner but it was too late to do anything anymore: I wrote a thesis work about my great idea during the next four years.

Nowadays this would be a criminal act but hippie era had left behind it kind of tolerance to new ideas and I was allowed to work rather freely with the idea. After four years work the thesis was published as article in International Journal of Theoretical Physics and J. A. Wheeler regarded the work as brilliant. I took the thesis and the referee statement and went to the same professor and told about my intentions. He did not have any other choice than to ask opinion from

two professors: the first one regarded the work as brilliant and second one debunked it. Thesis had to be accepted and the professor became my formal adviser.

For a brief period I thought that days of economic anxiety would be over and it would be possible to enjoy funding and get some research position. This turned out to be impossible. I had to invent some manner to make money and at the same time develop TGD further. I went to an IT course and learned the basics. Correction fluid and typewrite were replaced by text process, which was a really big practical step forward.

I went to a job in big oil company. My task was to model de-sulphurization of oil in reactor. Nothing bad in this but this was not meant for me. I felt deep self disgust for serving two masters simultaneously while sharing my life to few months long pieces of TGD and money making. I had also to spend 3-4 hours in day to the mere driving to the job and after year or so I was mature for burnout as the term goes nowadays. I was in high fever and unable to work. No-one knew what the problem really was but certainly psychologically impossible situation was the deeper cause of it.

During this period I had the “Great Experience”. After it I was mature to leave petroleum industry and find some kind of job allowing to continue my work with TGD. Then something very positive and unexpected happened. I was invited to Schrödinger centennial and made a visit to Einstein’s summer house to talk about my work. This had dramatic effect in local authorities. I got a job as a full-time teacher in Dept of Theoretical Physics but there was no hope about research position. After 6 years I made very stupid thing and applied for “dosentuuri”: I would be docent enjoying no special salary but allowed to lecture about my own research work. In their statement two young Finnish professors labelled me as a madman and I became an academic corpse. I left the University.

### 2.9.2 Very intensive sensory experiences

Back to the experience. In the beginning the experiences were very intense sensory experiences. Both visual, auditory experiences, and proprioception (body experience) were very intensive. The experiences often began with an amplification of heard sounds, say sound of a refrigerator. At the same time I had sensation analogous to cold shivers travelling along spine but now through the entire body like waves. My body also began to oscillate like a bed of reeds in wind in sea. I had a strange sensation that the refrigerator is attracting me towards it! I had a fear that my mind fuses to it somehow, and often stopped the experience. What was remarkable was the extreme purity of these experiences. No sensory noise, no tingle as usually. I called this experience “whole body experience”. Now I would interpret it as a phase transition to large  $h_{eff}/h$  phase establishing macroscopic quantum coherence in the scale of the entire body.

Some examples are help to understand what was involved. Consider first purely visual experiences.

1. In my neighbor lived a couple: both were doctors. I had been for about week in fever and the wife, a very friendly woman, came to see what might be the problem with me. I was surprised to see that her face literally radiated light. Only much later I realized that this might have been the aura which some people claim to be able to see.
2. Second example of a very intense visual experience was created by Renoir’s painting. The painting describes a street cafe in spring, in May perhaps. There is erotics and flirt in the air and the faces of young people radiated light. There was extremely strong feeling of real presence. I felt like standing on the street in a frozen moment and time could start to flow again at any moment.
3. Third example. I was walking along path in wood. It was a beautiful day of May. No snow anymore. There were little ponds and the sunlight was reflected from the surface of water and the reflection of trees on pond was like another world. There was a majestic silence and everything was shining. This kind of silence is of course not a lack of auditory consciousness as little as darkness is a lack of visual experience. I experienced that the world was completely pure without any dirt, just like my body in the whole body experience. I pondered whether all the dirt usually present in sensory experience is only due to the experiencer, rather than

being a fault of reality. By replacing dirt with suffering one ends up to a problem, which so many thinkers have pondered: is suffering only the outcome of ego?

There were also intense experiences involving music.

1. The first experience was stimulated by a piece by Debussy: Golliwog's cakewalk, a piece for children. I have though that Golliwog is a frog but I learned that this is not true: it is kind of imagined figure, rag doll (see <http://tinyurl.com/pukdj42>). The piece was played by a Japanese Hammond virtuoso, whose name I failed to find. The experience was fascinating in its surrealism and I felt how strong pulses from subconscious accompanied it.
2. Second experience involved both music and vision. I was seeing an animation about the evolution of life at Earth from TV. The music was Ravel's Bolero. The volume of sound increased steadily symbolizing the emergence of new life forms. As one might guess, the life and to escape Earth since human kind had destroyed the prerequisites for civilized life. Also now the strange surreality was present.

For some time I thought that my sensory experience had permanently intensified, and the eventual return to a normal consciousness was a great disappointment. I find now easy to understand we cannot enjoy deep euphoria continually. The generation of mental images requires metabolic energy and this does not favor those aspects of experience, which do not directly support the survival. We are like gardeners: the plants, which are not useful plants or ornament plants, are weeds and must be eliminated. Artists can have ornament plants in their mental garden - provided they can sell them at the market!

In the market economy based on furious competition this leads to a monoculture of consciousness. People are extremely specialized due the requirement of extreme effectiveness. For instance, students are not anymore allowed to spend few years in the intellectual Odyssea as was possible in my student days - this was partly thanks to the hippie era which changed the attitudes of students. We listen the same music, see the same movies, and spend our time in internet chatting. This rise of monoculture is very similar to the rise of biological monocultures leading to the disappearance of animal and plant species.

### 2.9.3 “Psychedelic” experiences

At later stages of the “Great experience” there was also an active component superposing with the sensory input. - Depending on one's attitude this component could be called hallucinatory or psychedelic. For me this component was not all hallucinatory: some of the key ideas of TGD inspired theory of consciousness emerged already during the experience and as a result of pondering this experience. These experiences completely destroyed my naïve materialistic world view about consciousness and life to which I have been harshly conditioned during 5 years as physics student. I realized that we do not have a slightest idea what consciousness and life really are. It is frustrating to see that after more than 3 decades most scientists and laymen still share the same delusion.

#### Freud was right!

The “psychedelic” experience (I have no personal experience about psychedelics so that the term might be misleading!) began as I was lying in the corridor of the health center. I had a horrible head ache and I realized that keeping eyes gently closed it is not quite so intolerable. I suddenly realized that my visual field contains a kind of hydrodynamic flow consisting of points going forth and back and containing vortices. I see this kind of flow also when I am writing and have very calm state of mind: it is however much dimmer. I would like to interpret the flow in terms of something flow along magnetic flux tubes: magnetic flux is indeed mathematically analogous to incompressible flow.

There was however also something else. An array of what looked like computer monitors or cartoon boxes. In each box something very wild was taking place. Salvador Dali and Hieronymus Bosch were the artists, whose works this vision brought into my mind. The boxes contained strange creatures, half animals and half human, humans, which were half males and half women. There was sex, physical violence, blood.

I had learned about the works of Freud during my school days at age of fourteen or so, perhaps too early! During student years I ceased to take seriously his theories. This experience however forced me to realize that Freud was absolutely right about Id-ego-super-ego trinity: Id was what I saw! I had however doubts whether it can be really me who has this kind of visual imagination: could these images flow to my retina from collective consciousness?

What would TGD inspired theory of consciousness say about this. I believe that if physicist tries seriously to develop a theory of consciousness, the outcome predicts almost unavoidably a hierarchy of conscious entities since also physical systems form hierarchies. This kind of hierarchy would generalize the Id-ego-superego trinity of Freud.

It is also natural to assume that conscious entity experience the entities below it and associated with its subsystems as mental images. This has surprisingly strong implications. My mental images die and are reborn continually. I am a mental image at the next level of hierarchy, perhaps kind of collective consciousness. Also I should reincarnate! If my mental image is very unpleasant, I do not allow it to be conscious: no metabolic feed and the mental image dies! Same should apply to me as a mental image. Maybe I have been especially unpleasant mental image in the collective consciousness of the community of theoretical physicists: at least I have not enjoyed a single coin of metabolic feed during these decades!

The hierarchy of conscious entities means pan-psychism in the sense that conscious entities can exist in all scales. In TGD many-sheeted space-time, p-adic length scale hierarchy, and the hierarchy of Planck constants  $h_{eff}/h = n$  implied by the adelic physics would serve as correlates for this hierarchy. It is interesting that also the IIT (integration information theory) of neuroscientists Tononi and Koch [J13] (for TGD inspired comments see [K87, K76]) assumes pan-psychism. Neuroscientists are forced to give up the naïve brain centered view about consciousness.

### Meeting the “Great Mind”

I found it very difficult to understand how I could have this extremely vivid visual imagination and concluded that I have got a contact to what I called “Great Mind”, maybe some kind of collective consciousness. I realized that I have a marvellous opportunity to ask all great questions bothering me and get answers! I also discovered that I can imagine of writing my questions on the computer screen in my visual field. The question appeared in it as beautiful calligraphy and were followed by an answer represented as a visual image, often dynamical. I understood also that there are two languages. The language of words and the language of images and there might be even a dictionary between them!

I started to build this dictionary! I wrote word and got a visual symbol as a response. Eventually I had the courage to write even the word “death”. The response was a symbol representing total blackout: all skin hair in my body stood up and I was horrified.

Eventually I also wrote a question “How long I will live?”. The answer was humorous. It was like an odometer of car with very many digits running wildly. I understood that I would live forever! Later I learned that I would re-incarnate again and again in other galaxies and even in other Universes: about the latter I could not make sense then in TGD framework and was a little bit annoyed!

The idea was there are two languages and the visual language would not be conscious to me. These language are indeed very different. Written or spoken language are very abstract: “house” represents entire equivalence class of houses, which can look very different but sharing some abstract features defining “houseness”. Very few digits are needed to express a given concept and this makes possible highly effective verbal communications distinguishing our species from others.

The image of a house (unless a symbol) provides a concrete representation of a particular house and requires a large number of bits. Images provide a holistic representation based on 2-D geometry not provided by written language or speech. Consider as an example a graph with nodes and links between them representing a structure of some complex systems with a lot of mutual relationships. It is rather tedious to represent this using only words. Algebra and geometry clearly correspond to language as text and language as images.

Interestingly, there is some evidence that dolphins have a language based on acoustic holograms: could it be that dolphins have developed acoustic languages based on 2-D acoustic analogs of visual images. Also human languages have developed from words represented as images and

only later came the abstraction decomposing words to letters having no direct meaning analogous to the decomposition DNA codons to letters. In chinese letters are still much like images.

### Are there also other two-country nationals?

I had also another experience with active component. I was also now lying on the corridor of health center and looking at the tiles in the roof and listening to a quite music. The tiles were dancing in the rhythm of music and inside them something very lively was taking place. I thought that perhaps there is really another world there, and I am able to perceive this other world. I wondered whether there are also other citizens of two worlds. How to get a contact with them? I certainly cannot go and tell to anyone about dancing tiles in the roof and what happens inside them!

It however turned out that this worry was premature. I became ordinary citizen again and although I sorely yearned for these experiences. They came only occasionally when I was falling asleep and lasted for a short time. A year or two later I had however a similar experience lasting for one night. Also it had profound effect on my life.

### 2.9.4 We are all artists!

The “Great Experience” inspires the idea that we are all artists: the process giving rise to mental images is an active process building a kind of caricature abstracting just the relevant features and suppressing the irrelevant ones. The following argument makes this claim more precise.

1. In some cases people who are congenitally blind can get their vision back. They do not however have any use for this ability: they report only a perception of diffuse light. This suggests that the perception involves a lot of processing analogous to that occurring in the pattern recognition, in which one has input, which generates a feedback - kind of virtual sensory input - depending non-linearly on input and interfering with it. The iteration of this process leads to a standard pattern, one in the repertoire of learned patterns and the feedback is tailored so that the pattern is as near as possible to the input. For instance one half of picture can be completed to the full figure in this manner. Pattern recognition is central problem in robotics. The robot must be able to recognize same object in various lightings and orientations, or by seeing only part of it. The object must be also distinguished from other objects. Same challenge is encountered in speech recognition.
2. This suggests that the feedback is virtual sensory input propagating to the level of sensory organs, such as retina. In principle, the feedback could also stop at a higher level and never reach the sensory organs. REM sleep and oto-acoustic sounds (heard even by outsiders in some cases!) however suggest that feedback propagates down to the sensory organs. If so, virtual sensory input from brain or via brain would be an essential part of sensory perception. Brain would also give names for the objects of perceptive field created in the process and build various associations. This would also lead to standard mental images making possible communications using language: language indeed distinguishes us from the other species.

This view would strongly suggest that the sensory qualia are at the level of sensory organs: this would be very natural since they are specified to produce specific qualia. Quantum entanglement between the sensory images would bind different sensory inputs to single coherence experience. This requires macroscopic quantum coherence in the scale of entire body and in TGD the hierarchy of Planck constants  $h_{eff}/h = n$  makes this possible.

3. Phantom leg experience serves as an objection against this idea. A person without leg lost in say traffic accident can feel pain in it. This should not be possible if the leg is missing since the nerve cells are not there anymore. Neuroscientist concludes that sensory qualia are generated at the level of brain and the pain is in the still existing sensory map of the leg. Sensory qualia should be assignable to the sensory areas. The problem is that nothing in the structure of neuronal circuitry suggests an explanation for why the qualia are so different in various sensory areas.

The most natural TGD based explanation is that pain in the non-existing leg is pain in the leg, which still exists in the geometric past - sensory memory. Sensory memories are indeed

possible. Idiot savants are capable of memory feats (say drawing a memory of a landscape in full detail or playing music piece that they have heard), which could be understood if they have sensory memories as genuine sensory experiences. Also ordinary people can have sensory memories if neurons in temporal lobes are excited electrically. A good reason for having no sensory memories is that they would interfere with sensory input and one would not know what time one is living in! I remember that my Grandma lived at very old age many years in her childhood. She was even going to a ball! Wonderful gift to lift youth again after long and hard life!

This makes sense in zero energy ontology (ZEO) in which perceptive field corresponds to a 4-dimensional causal diamond (CD) identified as the intersection of future and past directed light-cones. That sensory memories can be generated by the electrical stimulation of temporal lobes even in ordinary subject person supports this view. This could also explain why persons with about 10 percent of brain left can survive: they could use the brains of their geometric past.

4. What about imagination in this framework? Imagination is almost experiencing: almost seeing, almost hearing. Internal speech is almost talking. This suggests that the virtual sensory input from the brain or via the brain (from magnetic body) almost reaches sensory organs but not quite. For instance, in the case of vision signal could propagate down to the nuclei known as optic chiasma but not below it. Note that the sensory feedback in sensory perception should propagate down to the sensory organs if sensory qualia are there. The barrier preventing the generation of genuine virtual sensory input could however overcome in special situations and induce hallucinations or psychedelic experiences. Same applies also to imagined motor actions.

In adelic physics imagination can be understand in terms of p-adic space-time sheets. Strong form of holography (SH) allows to continue 2-D data at certain 2-surfaces to 4-D surface in p-adic sectors of the adele thanks to the phenomenon of p-adic pseudo-constants replacing integration constants with piecewise constant function depending on finite number of binary digits in partial differential equations. What is imaginable in this sense is not however always realizable since in the real sector integration constants are indeed constants and there is no flexibility of this kind! In the recent case imagination realized as p-adic perception would not allow continuation to a full perception in real sense and signal would not propagate to the sensory receptors.

5. What happened in the Great Experience? It seems that somehow the feedback associated with imagination managed to leak through the barrier preventing its manifestation as a genuine sensory input. Quantum criticality would be in question. Hallucinations, psychedelic experiences, dreams, and the experiences occurring when one falls asleep or wakes up, provide examples of this. This kind of leakage cannot happen always since it would be very dangerous. Brains are known to have its own psychedelic, DMT: could it have a role in making REM dreams possible?

Tesla is a well-known example of a person who saw his thoughts. This made him a technological genius. Many great composers have also heard music directly. For instance, Tchaikovsky suffered in his childhood from the continual music played in this head. Oliver Sacks tells about this kind of experiences in his book “Musicophilia” [L4] (see also the article [L4]).

The conclusion would be that we are artists of our own life. If one wants to build a better world, one could ask whether there could be some kind of program for achieving this. Could it be a good idea to use mor hours for art in the elementary school and in all education? The challenge would be to motivate the children to realize that they can learn to virtuosos of sensory perception and perhaps even artists in the ordinary sense of the word.

I known from a personal experience that this is possible. At the age of twenty the music of many composers left me cold: I could not comprehend it. After more than four decades I can enjoy almost any music provided it is complex enough. Also morning walk is a marvellous experience and with my eyes suffering from cataract I probably see much more than with the eyes of of twenty-year old! Our senses are the best gift that we have and at least in this age one can enjoy life by just perceiving.

## 2.10 Fatima Marian Apparitions And TGD Inspired Theory Of Consciousness

The MARIAN Project is an acronym form Multicultural Apparitions Research International Academic Network. Its funded on the data and results obtained by the trilogy books by the Portuguese historians Fina d'Armada and Joaquim Fernandes, since 1982 to 2002 [H8]. There is also a book by Vallee [H15] about Fatima apparition phenomenon.

The Project will take a deep look into a few clues, such as:

1. Identities and differences among human extraordinary experiences, i.e. OBEs, NDEs, AASs (Alien Abduction Scenarios) and MAs (Marian Apparitions), from the narrative, hermeneutic and sociopsychological levels and also cultural/religious backgrounds;
2. Neurophysiological details and all experimental elements that could be tested in laboratory, as the very common “buzzing” sounds heard by several witnesses at Fatima spot near the oak contact only when the Lady, according to Lucia, was speaking with her. This is the most hard clue ever depicted for a case of an hypothetic geomagnetic variables influence (very low magnetic fields?) tested in lab. by Michael Persinger and his team in Laurentian University [J23] .

In the sequel I shall comment Fatima Marian Apparation from the point of view of TGD inspired theory of consciousness. I base the discussion on what I learned about Fatima Marian Apparation via email exchanges with Joaquim Fernandes and some web sources. The basic data items used in the sequel are following.

Three children, Lucia, Fransisco, and Jacinta met a brilliantly effulgent lady whom they identified as the Virgin Mary. This occurred six times at 13th of each month. The so called Sun miracle was witnessed by people in a large area measured about 20-30 miles (it is estimated that about 70.000 people congregated in the vicinity of Cova de Ira to witness the predicted miracle!).

The witnesses reported a light tunnel and little image of Mary at its center. Also reported were heat waves with sudden drying of clothes, healings, fall of white filaments (“hair angle” ), and a strange auditory sensation defined by some witnesses as a “buzzing of bees within a vase”. This sound was heard *only* when the seer Lucia told that “the Lady was talking to her *without* moving the lips”. Also glowing globe-shaped vehicle appeared suggesting a similarity with UFO experiences.

### 2.10.1 General TGD Based Model

The TGD based model for Fatima Marian Apparition relies on the notion of self hierarchy allowing identify the entity “Maria” as a collective higher level self, a real conscious field entity receiving information from human brains by TGD counterparts of EEG waves, realized perhaps in magnetosphere. The visions and also some experiences of witnesses could involve in an essential manner quantum entanglement with “Maria” allowing sharing and fusion of mental images: no classical communication is needed. Quantum entanglement is the basic mechanism of remote mental interaction and remote healing: the occurrence of healings during Fatima apparitions were indeed reported. Microwave static, known to correlate with taos hum phenomenon involving sometimes also buzzing sounds [I26], is a possible candidate for the inducer of TGD counterparts of intense EEG waves by a general mechanism to be discussed. Also tectonic activity could have generated microwaves. Microwave static explains the buzzing sound as microwave audition [I23]. The presence of a plasmoid like structure serving as a relay station entangling with both seer and “Maria” could have generated light at visible and infrared frequencies and induces effects like heating and drying.

#### Self hierarchy and collective levels of consciousness and “Maria” as a conscious field entity

The basic notions of TGD inspired theory of consciousness are quantum jump between quantum histories identified as a moment of consciousness and self, which is essentially a pile of quantum

jumps integrated to single experience. The sequence of quantum jumps corresponds to subjectively experienced time which is in principle separate from the geometric time of physicist.

The preservation of self identity means that self does not generate bound state entanglement with the external world and remains thus quantum autonomous system during the subjective time development by quantum jumps. The generation of entanglement leads to a loss of consciousness: one can say that everything is conscious but consciousness can be lost. Selves form a hierarchy having the hierarchy of space-time sheets as a geometric correlate. Fusion of two space-time sheets by flux tube is the geometric correlate for the generation of entanglement. Sub-selves of two separate selves can entangle and this results in a fusion and sharing of a common mental image. This mechanism provides a general explanation of various remote mental interactions, such as telepathy, remote healing, and collective experiences. Also phenomena like apparitions and UFO experiences can be explained in terms of remote mental interactions.

In TGD universe any system has besides the visible, physical, body also field (magnetic) body, which has much larger, actually astrophysical size in the case of humans. What I call personal sensory representations are realized at the personal magnetic body of astrophysical size. Second type of sensory representations (third person view) would be realized at the magnetosphere of Earth and would give rise to multi-brained electromagnetic selves representing collective levels of consciousness. Amazingly, plasma sheet at the night side of Earth's magnetosphere is known to be a highly self organizing structure and the ionic velocity distributions represent features like "eyes" and "wings" [F11]. Even religions could represent to collective levels of consciousness having a rich repertoire of mental images like Maria and saints.

The simplest working hypothesis is therefore that the entity "Maria" is self, a completely real conscious entity, at a higher level of self hierarchy. In TGD framework any self defines a mental image of higher level self having it as a sub-self. The conscious entity "Maria" could communicate with humans using quantum entanglement making possible telepathic sharing and fusion of mental images.

1. The most obvious identification of "Maria" is as a mental image of a collective multi-brained consciousness realized at the magnetosphere and having only the field body. This would explain the cultural, standardized aspects of the vision.
2. One can consider also the hypothesis that the luminous "Maria" was analogous to UFO and in TGD framework identifiable as plasmoid, electromagnetic life form in TGD Universe, in the lower atmosphere, perhaps generated by tectonic activity. The physical effects associated with Sun miracle indeed suggest the involvement of a plasmoid like structure. The identification as Virgin Maria would thus reflect only the cultural background. It is however not obvious how plasmoid like primitive conscious entity could have predicted the occurrence of Sun miracle beforehand.
3. A compromise of this views is that plasmoid like structure was involved and served as a relay station entangling with both seer and "Maria", just like in TGD based model of UFO experiences. This option gives better hopes of explaining the physical effects involved and allows a lot of freedom in the identification of "Maria": even the identification as an extraterrestrial becomes possible.

### **Many-sheeted space-time, topological field quantization, and extraordinary experiences**

In TGD Universe space-times are 4-dimensional surfaces of certain 8-dimensional space-time. Many-sheeted space-time is the basic prediction of TGD and means roughly that various structures that we see in various length scales correspond to space-time sheets with outer boundary glued by tiny wormhole contacts to larger space-time sheets representing larger structures containing them.

Topological field quantization distinguishes between TGD and Maxwell's electrodynamics. What happens is that em field and classical fields in general decompose into flux quanta represented by space-time sheets. For instance, radiation field decomposes into cylindrical structures carrying em fields propagating with light velocity. These structures ("massless extremals", MEs [K57]) are ideal for classical communications: classical signal propagates with light velocity inside a cylindrical tube and without weakening making high precision targeted communication possible,

and the non-determinism of the associated vacuum current propagating also with light velocity allows a coding of arbitrary signal. At quantum level MEs serve as field bridges making possible quantum entanglement allowing sharing and fusion of mental images among other things. The mirror mechanism of long term memory relies on MEs allowing entanglement between geometric past and now and resulting in sharing of mental images.

Magnetic flux tubes and their electric counterparts represent also general solution families to field equations [K59, K58]. The flux tubes of Earth's magnetic field are super-conductors in TGD Universe and this super-conductivity is crucial for life. Closed magnetic flux tubes plus ions and their electric duals (involved with bio-electrets and liquid crystals and also with cell membrane) are the fundamental electromagnetic life forms around which ordinary bio-matter self-organizes.

Magnetic flux tubes are an essential element of the model of sensory representations on magnetic sensory canvas. Schumann resonances transmit horizontal communications between brains and could make possible collective shared experiences characteristic for Fatima case. Hypnagogic states give also rise to analogous experiences and probably involve Schumann resonances. The nodes of the super-conducting circuitry formed by the magnetic flux tubes could be of special importance for phenomena involving communications with higher levels of self hierarchy. Therefore special geomagnetic features could characterize the places where apparitions occur.

Water has an especially complex many-sheeted space-time structure and the proposal of A. Brodziak [H7] is that the spring water associated with places where apparitions have occurred plays some important role. We ourselves consist mostly of highly self-organized water and it would not be surprising if water would have varying degree of self-organization depending on external parameters such as the structure of the local magnetic field. Perhaps highly self-organized water helps to generate the quantum entanglement.

There are strong resemblances between TGD based models for UFO experiences, NDE experiences and Marian apparitions. Also in the case Fatima apparition structures which might have been interpreted as UFOs in our cultural context appeared and even "Maria" could have been interpreted as UFO in modern cultural context. The TGD based model of UFO experiences discussed involves in an essential manner quantum entanglement between conscious electromagnetic entities (plasmoids), and unifies Persinger's theories [J23] with the view that ETs are real, although not in the sense usually thought. Plasmoids could be seen as advanced counterparts of spaceships having a rather ghostly crew consisting of mental images (sub-selves) entangled with the magnetosphere of some distant astrophysical object serving as its telesensory system and able to entangle also with the person having UFO experience. Translating directly to this case this would mean that plasmoid like structure in the vicinity of the apparition place would have served a role of relay station entangling with both seer and entity "Maria", which could have been even extraterrestrial intelligence.

### Did "Maria" communicate quantumly or classically?

Taking seriously the idea about "Maria" as a collective conscious entity and a mental image of some collective self communicating from magnetosphere, one is led to ask how this communication could have occurred.

1. If the communication occurred purely quantumly just by entangling collective mental image/self "Maria" with the mental image of the receiver, the topological field quanta of EEG would have acted only as entanglers but not as carriers of classical information. This mechanism is extremely robust since there is no need to code information to a classical signal. TGD based model of long term memories relies on this mechanism. Very metaphorically: to have a long term memory from moment two years ago is to look at quantum mirror at distance of one light year. The attribute "quantum" means a telepathic sharing of mental images between sender and receiver. No storage of memories of past to recent moment of geometric time is needed. The immediate implication is that length scales of order light life are relevant for human consciousness: against this background magnetic sensory canvas hypothesis does not look so radical.

In this case the task is to generate topological field quanta of EEG which are intense enough to generate sufficiently stable and long lasting bound state entanglement between "Maria" and receiver making possible sharing of mental images by quantum entanglement. This requires

only that a sufficient amount of energy is transformed to the energy of EEG MEs at definite resonance frequencies so that the mechanism is very robust. plasmoid like structure could have served as kind of relay station entangling with both seer and “Maria” and perhaps also inducing at also visible radiation inducing heat waves and drying effects. Microwaves are not plausible candidates for causing heat waves since they might have caused too much biological damage.

2. One can imagine also classical, non-telepathic communication in which topological field quanta (topological light rays) carry classical signals regenerating the sound percepts in the brain of the receiver. This model raises many challenges: what is the code of communication for the classical signals, how the sender can resolve the problems caused by the fact that this code probably depends on receiver (by feedback one might hope), etc... Clearly, Occam’s razor does not favor this option.

### What was “real” and what was “hallucinatory” ?

The basic question relates to what reported effects had local physical correlates and which represented shared mental images. The microwaves possibly explaining the buzzing sound should have been real. The buzzing sounds themselves could have been purely endogenous. The reported glowing globe-shaped vehicle might have identification as a real plasmoid like structure. Even what was identified as “Maria” could correspond to a plasmoid like structure in the vicinity of the place of apparition. The “Sun turning around” is an excellent candidate for a plasmoid like structure. The radiation responsible for effects like heat waves and drying of clothes must have been real and perhaps induced by plasmoid like structure emitting at least visible light resulting in ionization of the atoms of atmosphere.

Collective sharing of mental images with plasmoid like structure entangled with “Maria” could explain the collective “hallucinatory” aspects of the experience. These self-organizing conscious structures could reside also in the outer magnetosphere, say in the plasma sheet at the night side of Earth [F8]. The reports about light tunnel with the image of little Mary at the center and about pouring of flower petals would suggest a collective experience based on the sharing of mental images.

### Healing effects

TGD provides a general theory of remote healing relying on quantum entanglement occurring even in astrophysical length scales and involving collective selves [K67]. There is support for the view that remote healing is possible even when the healer does not know the patient personally or where the patient lives. As if there would be a third party involved, a collective multi-brained higher level self, for whom the data, which is insignificant for healer, makes sense. Also the well documented healing effects of prayer and meditation groups can be understood if there is this third party. In this case this collective self would be “Maria”.

## 2.10.2 The Mystery Of The Buzzing Sound

The witnesses of Fatima Marian Apparition report buzzing sounds like bees in a vase. It would be interesting to determine the frequency spectrum of the buzzing sound produced by bees: presumably it results from the periodic motion of wings. Also one could test how strongly the sensation depends on the average frequency and to what degree the shape and phase relationships of Fourier spectrum are responsible for the sensation.

### Meteor sounds, taos hum, and physiophonic sounds

The buzzing sound might relate to several other strange sound phenomena like meteor sounds, taos hum, and physiophonic sounds. These exotic sound phenomena are discussed in [K42].

1. A strange finding supporting the TGD view about sensory representations is that, contrary to expectations, the sounds generated by em fields of meteors have fundamentals around 40 Hz thalamocortical resonance band responsible for sensory representations [F15]. This sound

is like “pop”, not buzzing, but frequency spectrum might be nearly the same. One might check whether 40 Hz frequency band is involved also with the buzzing sound produced by bees.

2. Taos hum [I26] is a strange phenomenon which might relate to the microwave audition. No source for this sound, which has frequency spectrum in the range 40-80 Hz, has been identified. Taos hum seems to be an endogenous sound generated by classical em or  $Z^0$  field which does not penetrate outside the body. Buzzing sound is also sometimes associated with taos hum. If the buzz has the character of taos hum, this would require that sounds heard also by the witnesses were endogenous and not recordable by microphones. There is strong correlation between taos hum and so called microwave static having poorly understood biological origin [I26].
3. Physiophonic sounds are endogenous sounds produced by electric stimulation of skin. One can transform speech to electric signals applied to skin and experienced as comprehensible speech. Physiophonic sounds are probably closely related to taos hum.

### Microwave hypothesis

It has been proposed [H8] that so called microwave audition [I23] could be involved with the mysterious buzzing sounds reported by witnesses of the Fatima Marian Apparitions. There exists a standard physics explanation for microwave audition based on thermal effects caused by microwaves inducing small pressure pulses [I23]. This explanation is however subject to objections to be discussed later and TGD suggests an alternative mechanism.

According to [H8] French and Canadian researchers have found interesting results using a source of microwaves on the subjects heads: one of the sounds type heard was a “buzzing”. The source was between 200 and 3000 MHz with a mean intensity of from 0.4 to 2  $mW/cm^2$  to a density level of above 300  $mW/cm^2$ . The modulating frequencies ranged from 200 to 400 Hz. According to [H8], the insect sounds resulting from the motion of wings could be put between that interval. An order of magnitude for the resonance frequency of body guessing the sound velocity to be  $v = 300$  m/s in body and body to have a size of order  $L = 1$  m is  $f \sim v/L = 300$  Hz. Microwaves could correspond to microwave static of biological origin [I26] or be generated by plasmoid like structures.

Microwaves has been proposed as an explanation for the other physical effects reported in Fatima apparitions, namely those associated with the so-called Sun miracle when the people saw the “Sun” turning around itself and produce a heat wave that dry the soil that moments before has been wet by a sudden rain, as well the clothes of people in the spot, also wet. The problem with this explanation is that microwaves with the required intensity might have had drastic physiological effects: there is no known evidence for this. A more plausible explanation is that the plasmoid like structure playing the role of entanglement relay station induced these physical effects at visible and infrared wave lengths and was erratically identified as Sun. Ionization of atmosphere would have indeed induced emission of visible light.

Most importantly, microwaves could accompany EEG MEs by a mechanism to be discussed later: these topological field quanta in turn make possible quantum entanglement and sharing of mental images. Topological field quanta corresponding to 40 Hz resonance band are especially interesting candidates in this respect since in TGD based model they are responsible for sensory representations at magnetic sensory canvas.

### 2.10.3 Microwaves, Consciousness, And Life

The TGD counterparts for strong EEG waves are topological field quanta (electromagnetic bridges or topological light rays connecting seer with “Maria” ) generating quantum entanglement making possible the sharing of mental images. Also witnesses could participate in the vision (image of Mary in the center of the cylindrical light tunnel, Sun turning around). Microwaves received by the brain and possibly by the body of the seer and also witnesses (creating sensation of buzzing sound) could have generated topological field quanta of EEG waves and induce as a byproduct also microwave hearing [I23] responsible for the sensation of buzzing sounds.

### Support for the importance of microwaves

Microwaves span the wavelength range 1 mm -30 cm corresponding to the frequency range 300- 1 GHz. Note that the size of the dots in X-ray film was of order one 1 milli-meter and corresponds to the upper limit of 300 GHz for microwave. There is support for the importance of microwaves for living systems coming from various anomalous phenomena involving microwaves.

1. Microwaves in GHz range are found to be involved with water memory and homeopathy [I11]. Microwave frequencies are accompanied by ELF frequencies such that the high and low frequencies  $f_{high}$  and  $f_{low}$  are related by the scaling law to be discussed later.
2. Microwave hearing [I23] is a phenomenon in which microwaves in the frequency range 2-3 GHz (wavelength range 10-15 cm) induce a hearing sensation. There is evidence that ears are not involved with the microwave hearing [I12]. The average pressure of the radar wave at the threshold of hearing is roughly three orders of magnitude less than the average pressure of a sine wave in air at the threshold of hearing air waves. Second, the location of the most sensitive area for hearing radar is remote from the ears, on top of the head. Third, the subjective frequency spectrum seems to include higher frequencies for radar hearing than for normal hearing of air waves. Fourth, the direction from which sound seems to come does not change as the head is turned about in the radar field.
3. Microwave static of biological origin having strong correlation with taos hum [I26] and taos hum could be seen as a particular case of microwave hearing [K42].
4. The proposal of Joaquim Fernandez [H8] that microwave hearing would also explain the strange buzzing sounds reported by the witnesses of the Fatima apparitions served as a clue to the TGD based model of this phenomenon. The model led to the realization that quite a many apparently unrelated phenomena rely on a general mechanism of remote mental interactions in which microwave MEs propagate like mass-less particles inside ELF MEs, which generate the entanglement between remote subjects and thus make possible sharing of mental images and remote realization of intentions. Microwave MEs in turn induce self-organization at the end of the receiver. The same mechanism is involved also with the endogenous realization of intentions and remote healing.

### Breaking of super-conductivity in many-sheeted space-time and microwaves

The transfer of charged particles between space-time sheets is possible provided so called flux tubes connecting the boundary of a smaller space-time sheet to the boundary of a larger space-time sheet are generated [K15]. Particles simply flow along this bond connecting the space-time sheet to the larger space-time sheet, say magnetic flux tube, and also vice versa. This mechanism leads to the breaking of super-conductivity since super-conducting matter from the magnetic flux tubes, which can be at extremely low temperature, flows to the atomic or possibly some other space-time sheets.

Microwave radiation could generate flux tubes. The energies of microwave photons in the wavelength range 1-100 mm are in the range  $10^{-5} - 10^{-3}$  eV and correspond to the temperature range .1-10 K. The critical temperatures for low temperature super-conductors are in this range. One can interpret this by saying that super-conductivity is not destroyed by the heating of the magnetic flux tubes but by the generation of the flux tubes with bond energy of order of the gap energy causing the leakage of the supra current to non-super-conducting space-time sheets and thus inducing dissipative effects.

### Microwaves and biological control circuitry

The basic vision of the TGD inspired theory of consciousness [K48] is that everything is conscious and consciousness can be only lost. This philosophy naturally leads to the view that plasma structures consisting of closed magnetic flux tubes plus atomic space-time sheets containing plasma ions represent primitive life forms. All life forms metabolize. In the case of plasmoid like life forms micro-waves induce a primitive metabolic cycle in which ions are transferred from the magnetic flux tubes to atomic or some other space-time sheets, where they dissipate and induce ionization and UV and visible light and then “drop” back to the magnetic flux tubes. If the intensity of the

magnetic field is about .2 Tesla, which by the quantization of magnetic flux, corresponds to p-adic prime  $k = 157$  and p-adic length scale of 80 nanometers), electronic cyclotron transitions generate microwaves with frequency of about 2.4 GHz and the system can thus generate its “food” itself.

Microwaves can also “kick” ions from magnetic flux tubes to  $k = 151$  space-time sheets since the zero point kinetic energies for  $k = 151$  correspond to microwave frequencies. It seems that the process involves at least the following space-time sheet:  $k = 137$  (atomic),  $k = 151$  (cell membrane),  $k = 157$ , and  $k = 169$  (magnetic flux tubes of Earth’s magnetic field). UFOs are often observed near the lines of the tectonic activity could represent this kind of life form using the energy of microwaves of tectonic origin (quartz crystals are piezoelectrics and can amplify wide range of microwaves) as their “food” and therefore following the microwave beam emanating from the spot of tectonic activity. Also the UFO like structures associated with the Fatima apparition could be plasmoid like life forms.

In the living matter the same simple biological Karma’s cycle has developed to an extremely complex many-sheeted circuitry in ionic flow equilibrium and controlling the homeostasis [K38]. Microwaves radiated in the conformational transitions of proteins and possibly amplified by the rotational transitions of water molecules and clusters of them mimicking the rotational spectra of molecules generate bridges connecting super-conducting space-time sheets and atomic space-time sheets and thus sustain the dynamical circuitry. If some protein fails to be expressed genetically, this implies the absence of certain microwave frequencies so that corresponding bridges are not present and erratic functioning of the current circuitry result. Medicines and homeopathic remedies in which water clusters mimic the rotational spectrum of the medicine molecules generate the microwave spectrum of the proteins, which are not expressed.

The average number of the bonds per say area element is the natural measure for the effectiveness of the bridge, and the increase of the microwave radiation intensity at some frequency increases the effectiveness of the corresponding bond and thus modifies the homeostatic equilibrium. Electromagnetic radiation in microwave range is known to be lethal to micro-organisms: this could be due to the transformation of the biological current circuitry induced by the radiation. Too high leakage of supra-currents to atomic space-time sheets might be also fatal. Personal computers and travel phones produce microwave radiation and this raises interesting questions about their role in modifying many-sheeted current circuitry and thus modifying the homeostasis. One can also wonder about the role of this radiation in electric allergies.

### Microwaves and the mechanism of remote intentionality

TGD based model of remote mental interactions is discussed in [K67]. The model is based on the notion of bound state quantum entanglement having as a geometric correlate the formation of so called flux tubes. Magnetic flux tubes as well as topological field quanta of radiation (“mass-less extremals”, or briefly MEs [K57] ) could act as such bonds. Many-sheeted space-time makes in principle entanglement possible in even astrophysical time scales. Also time-like entanglement is possible by the non-determinism of the basic variational principle and is provides quantum mirror mechanism of long term memory [K70] ). Essential is also the notion of adjunct serving as a kind of relay station entangling any two subjects during remote mental interaction, say healer and healed, and inducing sharing and fusion of mental images and making possible also classical communications. An object possessed by the healer or healed is one example of an adjunct.

The entanglement is generated by mass-less extremals having a length, which is a multiple of the wavelength of the radiation involved and therefore the frequencies involved are typically ELF frequencies. On the other hand, the work done after developing this model has shown that also microwave MEs are probably involved. Human intention could be able to generate microwave MEs giving rise to the bonds between magnetic flux tubes and atomic space-time sheets also outside the body. Brain and body certainly generate microwaves (GHz frequency scale corresponds to protein and DNA conformational dynamics and water’s rotational transitions), and the intention could be remotely realized as these microwaves if the system is sensitive to the microwaves. The problem is to understand how ELF MEs and microwave MEs are related to each other.

### How microwave MEs and ELF MEs are related?

The existing TGD based model for remote mental interactions is based on ELF (extremely low frequency) MEs serving as field bridges between sender and receiver and inducing entanglement. Also microwaves must relate closely to the remote realization of intentions. The question is how these two aspects of remote mental interactions are related.

1. ELF MEs are crucial for the sensory representations at the personal magnetic canvas and on the magnetic flux tubes structures in magnetosphere. The simple “feeling of existence” is generated by cyclotron transitions and the most effective manner to generate these is to “kick” super-conducting ions first to the atomic or some other space-time sheet. The ions having large zero point kinetic energy can “drop” back to high  $n$  cyclotron states at the magnetic flux tubes and decay by emitting a large number of ELF photons. Microwaves might be responsible for generating the bridges making this flow of ions to the atomic space-time sheets possible. Microwaves could also “kick” ions from magnetic flux tubes to  $k=151$  space-time sheets and the “dropping” of ions back by photon emission would generate further microwaves.
2. Magnetosphere is expected to contain plasmoid like life forms defining sensory representations getting input from biosphere. Microwaves are the “food” of the plasmoid like life forms and the question is where these life forms get their food from: from biosphere or from brains perhaps?
3. The so called scaling law [K38] predicting that high and low frequency MEs somehow accompany each other, helps to understand the situation more clearly. The scaling law abstracted from the findings summarized in [I11] reads as

$$f_{high} = (c/v) \times f_{low} \quad , \quad c/v = 2^{137-k} \times 2 \times 10^{11} \quad .$$

Here  $v$  is some velocity associated with the system transforming low frequency waves to high frequency waves and vice versa and  $k$  is prime of power of prime defining so called  $p$ -adic prime  $p \simeq 2^k$ , labelling the space-time sheets of the many-sheeted space-time and characterizing their sizes.  $k = 137$  corresponds to the space-time sheets of atomic size and gives  $c/v = 2 \times 10^{11}$ .  $k = 151$  corresponds to the cell membrane length scale and gives  $v \simeq 6$  m/s, the phase velocity of alpha waves at the surface of skull.

TGD allows to understand the mechanism behind the scaling law:  $f_{high}(k)$  corresponds to zero point kinetic energy of an ion at the space-time sheet labelled by  $k$ , and flow to cyclotron frequency at the magnetic flux tube of Earth’s magnetic field: both these energies are inversely proportional to the mass of the ion.  $k$  refers to the space-time sheet from which the ion “drops” to the magnetic flux tube. The value of  $c/v$  is inversely proportional to the local value of Earth’s magnetic field and thus varies somewhat. In the case of  $k = 151$  this could explain the variation of the nerve pulse conduction velocity and EEG phase velocity.

The problem is to understand how EEG MEs and microwave MEs are related. It has been already hypothesized that they implicate each other and TGD provides mechanisms for how this is possible. A more detailed hypothesis is that the ELF MEs serve as entangling em bridges along which the microwaves MEs propagate like mass-less particles to the magnetic sensory canvas to be used by the plasmoid like life forms. The ions are “kicked” by microwaves to the atomic or possibly also other space-time sheets and “drop” back to high  $n$  cyclotron states which then decay by cyclotron radiation in ELF energy range. This self-organization process generates the simple “feeling of existence” mental image at magnetic sensory canvas entangled with more complex mental images in brain.

### Microwave hearing

The previous findings encourage to think that microwave hearing involves the transformation of microwaves to EEG waves responsible for entangling brain with the magnetic sensory canvas. It might be that microwave beam actually induces the transfer of ions from magnetic flux tubes to atomic space-time or cell membrane space-time sheet (say), which then “drop” back and in

the latter process induce also cyclotron radiation at EEG frequencies generating the auditory experience. Interestingly, for  $k = 151$  the zero point kinetic energies of ions are in microwave range and the “dropping” of ions from cell membrane space-time sheets to magnetic flux tubes of Earth could be involved with the amplification of both microwaves and generation of EEG waves by cyclotron transitions at magnetic flux tube. The velocity parameter  $v$  corresponds in this case to alpha wave phase velocity at the surface of skull. The lowest Schumann resonance at 7.8 Hz is in alpha band and there are reasons to believe that it is closely related to the UFO experiences and thus also to Fatima apparition.

In TGD universe these EEG MEs would project directly to the auditory magnetic canvas and generate the experience. Of course, one could argue that the modulation of EEG wave by a frequency higher than EEG wave does not make sense. There is actually however no reason forbidding “fast modulation” analogous to small ripples on sea waves and this kind of representation has been proposed to give rise to “features” [?] in alpha band [K42]. The fast modulation could also occur with respect to subjective time: the fast modulation of the number of EEG MEs with respect to subjectively experienced time (defined by quantum jump sequence) is also possible: in this case there would be no modulation with respect to the geometric time. If the space-time sheet associated with brain and various brain structures (the sizes are correct!) serve as a receiving microwave antennae they could also act as active emitting antennae.

The amplification of microwaves could be seen as a maser like mechanism in which ions are pumped to  $k = 151$  space-time sheet by microwaves. The existing microwave photons stimulate the dropping of ions back and thus also the generation of new microwave photons.

In many-sheeted space-time particles topologically condense at all space-time sheets having projection to given region of space-time so that this option makes sense only near the boundaries of space-time sheet of a given system. Also p-adic phase transition increasing the size of the space-time sheet could take place and the liberated energy would correspond to the reduction of zero point kinetic energy. Particles could be transferred from a portion of magnetic flux tube portion to another one with different value of magnetic field and possibly also of Planck constant  $h_{eff}$  so that cyclotron energy would be liberated.

If the “dropping” of ions from  $k = 151$  space-time sheet amplifies the microwaves, microwave hearing is predicted possible from 3.75 Hz (He cyclotron frequency 75 Hz) down to frequencies.16 GHz corresponding to delta band (1.5 Hz cyclotron frequencies possible for heavy ions). Delta band dominates during deep sleep and the model of magnetospheric sensory representations predicts that brains can entangle with the plasma sheet by EEG MEs at delta band. This could correlate with the appearance of microwave static at nighttime [I26]. Perhaps delta waves entangle sleeping brains with magnetospheric selves and microwaves feed energy to the corresponding mental images. The plasma sheet at the night side of the magnetosphere is indeed known to contain self-organizing plasma structures with ionic velocity distributions representing features like “eyes” and “wings” [F11]. The prediction is that heavy ions should play important role in the generation of EEG during sleep.

The resulting unification would be rather economical. The formation of sensory representations, remote mental interactions, homeostasis, and homeopathy would all rely on the same basic mechanism: high frequency MEs propagating as mass-less particles along low frequency MEs. Low frequency MEs would induce quantum entanglement and high frequency MEs would force self-organization at the end of the receiver.

### Do electromagnetic life forms “eat” microwave energy?

In the case of UFO experiences, and perhaps also in the case of Fatima Marian apparition, microwaves, possibly generated by the tectonic activity, could have also a further important function besides entangling brains with the conscious entity involved. According to the TGD based proposal, so called plasmoids consisting of closed magnetic flux tube structures carrying supra currents plus atomic and  $k = 151$  (at least) space-time sheets associated with them, are good candidates for primitive electromagnetic life forms, in particular plasmoids identified as UFOs. Ordinary bio-matter is assumed to self-organize around these structures and nerve circuit represents a good example of a structure resulting in this manner.

Plasmoids from outer space could leak into the magnetosphere mostly through pole gaps, where the magnetic field of Earth is weak: elsewhere magneto-pause serves as a magneto-immune

system, which does not allow the penetration of the external magnetic life forms to compete about energy sources. In accordance with magneto-immune function, planetary magnetospheres are known to be self-organizing structures and the fact that Mars does not possess magnetosphere might relate to the disappearance of Martian life. Also the magnetic field of Earth is getting weaker and the change of the polarity expected to occur within two thousand years might have rather dramatic consequences for the life as we know it.

Also the magnetic life forms need energy feed to self-organize and stay awake. Plasmods could populate magnetosphere and only wait for energy sources to self-organize. The basic metabolic mechanism would be the same as in the case of living matter [K41]. Energetic super-conducting ions must be somehow driven from the magnetic flux tubes to the atomic space-time sheets, where they collide with atoms, ionize them, and generate visible light in the atomic transitions giving thus rise to the observed luminous phenomena interpreted as UFOs (perhaps as the luminous entity “Maria” in Fatima case). The ions would eventually “drop” back to super-conducting space-time sheet and liberate the zero point kinetic energy as a quantum of metabolic energy defining what is often referred to as a universal energy currency. Essentially identical energetic cycle of Karma would be realized also in living matter but involve a complex molecular organization and many-sheeted current circuitry responsible for the control of homeostasis. For the proton the quantum is predicted to be of order .5 eV liberated also when a single molecule of ATP is used.

The realization of this primitive metabolic cycle requires the breaking of super-conductivity: some mechanism must generate join along boundaries bonds serving as bridges connecting magnetic flux tubes with atomic space-time sheets along their boundaries so that supra current leakage becomes possible. Microwave radiation could generate the required flux tubes to  $k = 151$  space-time sheets and pre-existing IR MEs could be responsible for the bridges between  $k = 151$  and atomic space-time sheets. The energies of microwave photons in the wavelength range 1-100 mm are in the range  $10^{-5} - 10^{-3}$  eV and correspond to the temperature range 1-10 K. The critical temperatures for low temperature super-conductors are in this range (note that the temperature at the magnetic flux tubes would be much lower). One can interpret this by saying that super-conductivity is not destroyed by the heating of the magnetic flux tubes but by the generation of the join along boundaries bonds with bond energy of order of the gap energy causing the leakage of the supra current to non-super-conducting space-time sheets and thus inducing dissipative effects, the dropping of protons and ions from  $k = 151$  cell membrane space-time sheet generates also microwave radiation.

This suggests that microwave photons could induce these bridges, break super-conductivity, and induce energy feed and self-organization. A similar breaking of super-conductivity might be also involved with the driving of the super-conducting ions to the  $k = 151$  space-time sheets in the living matter. Proteins could generate the needed microwave photons by coherently occurring conformational transitions. Also rotational transitions of clusters of water molecules could emit microwaves and perhaps mimic and amplify the microwaves generated by proteins. IR photons of .5 eV produced metabolically “kick” protons to atomic space-time sheets. The MEs with electrical potential difference of .5 eV define the classical correlate for this process as acceleration of proton in electric field in full consistency with the existing model of ADP-ATP process.

Plasmoids, being extremely light structures, could easily follow the energy beam flowing from the spot of tectonic activity, and the random variation of the beam direction could explain the random butterfly like motion of UFOs often observed and very difficult to understand if UFOs are structures built of steel and copper. The strange motion assigned with Sun in the case of Sun miracle can indeed be interpreted as an example of this kind of rapid random motion of plasmoid possible following microwave beam of tectonic or some other origin.

One can also imagine that plasmoids generate partially their microwave “food” themselves via the cyclotron transitions of electrons. This would require that the magnetic flux tubes in question carry a magnetic field of about .2 Tesla: the p-adic length scale in question corresponds to the thickness of the cell membrane. Solar convective zone contains magnetic fields with this strength.

### 2.10.4 Fatima Apparition And Microwave MEs

In the case of Fatima apparition the interaction of microwave MEs accompanied by ELF MEs would generate entanglement between the brains of people seeing the visions, plasmoid like life forms serving in the role of medium, and conscious entity “Maria”. Same mechanism applies to UFO and ET experiences in general.

#### What was the source of microwaves?

The buzzing sound heard only when Maria talked with closed lips might be understood as follows. Buzzing sound would be due to microwave hearing. Facial expression is important part of communications, especially so when one cannot speak loudly. When microwave energy feed was near the threshold of the microwave hearing, “Maria” had to use also facial expression in order to become better understood. This explanation however implies that the strength of microwave radiation was not under the control of the sender of the message or that the control was only partial.

The microwaves could correspond to the so called microwave static having biological origin and correlating strongly with taos hum: also taos hum can involve buzzing sound sensations [I26]. This microwave static appears at evening and ceases in the morning hours at definite local time. One plausible source of microwaves are transitions associated with protein conformations for which the time scale of dynamics is around .1 nanoseconds. It would be interesting to know what time of day the apparitions appeared. The occurrence of the event at 13<sup>th</sup> of every month is suggestive of both external intelligence and a biorhythm giving rise to especially intense microwave static with a period of month.

The possible biological origin of the microwave static raises the question whether the oak was the source of the microwave static. Oaks are holy trees in many ancient cultures: perhaps their ability to induce apparitions by strong microwave static could explain this partly. Some people (including me in very calm state of mind) are able to experience what might be called “a silent conscious presence” of trees. The energy scale for the rotational excitations of molecules is in the microwave region. In particular, rotational transitions of water molecules and clusters of them can generate microwave radiation effectively. Quartz crystals, piezo-electrics used both in clocks and for healing purposes, could amplify the microwaves using the energy provided by the tectonic activity. If the dominating contribution of the microwave energy is of tectonic origin, the strange motion of Sun experienced by many witnesses during Sun Miracle could correspond to the motion of a plasma ball following tectonic microwave beam. Of course, this is not the only possibility. The reported healings during apparitions suggest that microwave photons directed from the plasmoid to the brains and bodies of the witnesses were involved. If plasmoids carrying magnetic fields of order .2 Tesla for which electron cyclotron frequency is 3 GHz were involved, they could have generated these microwave photons. Also the model for crop circle formations requires plasmoids with similar magnetic field strength [H18] [K27] and light balls are frequently observed near crop formations.

The heat wave causing drying of soil and cloths could have been caused by visible and possibly also infrared light generated by the plasmoid like structure, when highly energetic superconducting ions flowing to the atomic space-time sheets dissipated their energy by colliding with the atoms of atmosphere and by ionizing them.

#### Connection with Schumann resonance

If microwave hearing involves the “dropping” of ions from  $k = 151$  space-time sheet and liberation of zero point energy as microwaves propagating along EEG MEs one could understand the connection with the Schumann resonance at 7.8 Hz in alpha band.

a) As a cavity resonance Schumann resonance prevails in entire Earth size scale, and is in TGD based model of magnetospheric sensory representations responsible for horizontal communications between different brains, and more generally, between various conscious entities. For instance, during hypnagogy alpha band dominates and could be the sharing of mental images give rise to the strange experiences in which one experiences of being another person. alpha band is also associated with creativity: perhaps our ideas are not completely ours.

b) The velocity parameter  $v$  predicted by the scaling law for  $k = 151$  (cell membrane space-time sheet) is the velocity of alpha waves at the surface of skull which suggests that alpha waves

are generated in the process. For  $K^+$  and  $Cl^-$  ions cyclotron frequencies are 7.5 Hz and 8.5 Hz respectively and near to Schumann frequency and these ions are important for brain functioning: their cyclotron radiation could resonate with Schumann resonance (note that the local value of Earth's magnetic field in brain could be subject to homeostatic control). Thus the "dropping" of these ions from cell membrane space-time sheet could be crucial for the quantum entanglement with the conscious entity Maria.

### Angel hair

The mysterious angel hair might result when ions from magnetic flux tubes flow to atomic space-time sheets. Perhaps the process creates chemical compounds in molten state which then cool and solidify. Hair like appearance might reflect the geometry of magnetic flux tubes (whose thickness is about 2.5-5 micrometers for Earth's magnetic field). Many crop formations are known to contain magnetized iron [H18] as well as small glass balls consisting of  $SiO_2$ , that is quartz [H10]. Meteoric iron could come from the ionosphere along magnetic flux tubes. Si ions or quartz could flow along magnetic flux tubes from the spot of the tectonic activity to the plasmoid, and become heated to high temperature when entering to atomic space-time sheets and colliding with oxygen atoms of the atmosphere. This in turn would give rise to glass balls. An analogous mechanism might be give rise to angel hair.

### Were the "vehicles" real?

There is some anecdotal evidence suggesting that UFOs are more than mere plasma balls, and this kind of objects might have been involved also with the Marian apparition. Many-sheeted space-time concept predicts a mechanism leading to the reduction of inertial and gravitational masses of spinning magnetic systems [K92]. These objects are predicted to be accompanied by plasma. There is laboratory evidence for this kind of phenomenon [H22]. Hence some UFOs could be space crafts possessing almost vanishing gravitational and inertial masses and the vehicles observed by witnesses in the case of Marian apparition could be also genuine space crafts of this kind.

### Healing phenomena and apparitions

Healings and water with special healing properties are also associated with Marian apparitions [H7]. Microwave hypothesis provides understanding also about this aspect, and somewhat unexpectedly, about the mechanism of homeopathic healing.

In [K38] it was proposed that the clusters of water molecules forming liquid crystals can mimic the rotational spectrum of various molecules, and that the ability to reproduce the rotational frequency spectrum of the medicine molecule is an essential element of homeopathic healing. The level of self-organization of water would thus be measured by how complex mimicry it is able to perform.

Why rotational microwave energy spectrum is so important for healing, can be understood as follows. The many-sheeted current circuitry, involving atomic space-time sheets and magnetic flux tubes and also other space-time sheets, is extremely complex control structure [K59, K58]. The continual regeneration of bridges between say atomic space-time sheets and magnetic flux tubes by microwaves emitted by proteins is necessary to sustain this circuitry. An important category of diseases is due to the failure to generate the bridges between super-conducting and atomic space-time sheets so that this control circuitry suffers shortcuts. Perhaps the genetic expression of some proteins responsible for the microwaves generating particular bridges fails. The medicine or its homeopathic counterpart would help to generate (or even re-establish the generation of) the microwave spectrum responsible for the generation of the lacking bridges in the circuitry.

This would allow to understand why spring water with special healing properties seems to be a correlate of apparition places [H7]. Just like the homeopathic remedy, the spring water would mimic the rotational energy spectrum of some medicine molecules and would induce the same healing effects (I am grateful for A. Brodziak for emphasizing the importance of the homeopathic aspect).

In present case the healing would require the feed of microwave energy to the healed. It could be the energy is transferred via the mediation of the self-organizing plasmoidic life form and has tectonic origin.

## Chapter 3

# EEG and the structure of magnetosphere

### 3.1 Introduction

Roughly 15 years ago I proposed the idea that Earth's magnetosphere could serve as a sensory canvas in the sense that biological systems, in particular the vertebrate brain, could have sensory representations realized at the "personal" magnetic body (MB) closely associated with the magnetosphere of the Earth [K44, K42]. EEG would make communications to and control by MB possible [K30, K69].

During fifteen years a considerable progress has occurred. At that time I did not have yet the idea about the number theoretical realization of hierarchy of Planck constants  $h_{eff} = nh_0$  in the framework of adelic physics fusing the physics of sensory experience and cognition [L11, L12]. This hierarchy is crucial for understanding the basic aspects of living matter such as metabolism, coherence in long scales, correlates of cognition, and even evolution.

Also the concept of zero energy ontology (ZEO) [L28] forming now the basis of the quantum TGD was missing although there was already the about communication to past using negative energy signals. ZEO is now central role in the understanding of self-organization [L26] - not only the biological one. The new view about time predicting that time reversal occurs in ordinary state function reductions (SFRs) allows to understand homeostasis as self-organized quantum criticality [L80].

For these reasons it is interesting to consider the notion of sensory canvas from the new perspective.

#### 3.1.1 Some basic ideas of TGD inspired quantum biology

The following list gives the basic elements of TGD inspired quantum biology.

1. Many-sheeted space-time allows the interpretation of the structures of macroscopic world around us in terms of space-time topology. Magnetic-/field body (MB) acts as intentional agent using biological body (BB) as a sensory receptor and motor instrument and controlling the BB and inheriting its hierarchical fractal structure. The quantum coherence of MB in turn induces the coherence of biomatter.

That MB receives sensory input motivates the idea that MB serves as a kind of sensory canvas [K44, K42]. This idea generalizes: the information received can be also more abstract information and the layers of the MB could define a hierarchy of increasingly abstract representations of the sensory data [L32, L82].

Fractal hierarchy of EEGs and its variants can be seen as communication and control tools of MB. Also collective levels of consciousness have a natural interpretation in terms of MB.

MB makes also possible entanglement in macroscopic length scales. The braiding of magnetic flux tubes makes possible topological quantum computations and provides a universal mechanism of memory. One can also understand the real function of various information molecules

and corresponding receptors by interpreting the receptors as addresses in quantum computer memory and information molecules as ends of flux tubes which attach to these receptors to form a connection in quantum web.

2. MB carrying dark matter as  $h_{eff} = nh_0 > h$  phases of the ordinary matter and forming an onion-like structure with layers characterized by large values of Planck constant is the key concept of TGD inspired view about Quantum Mind to biology.

MB is identified as intentional agent using biological body as sensory receptor and motor instrument [K62, K61]. EEG and its fractal variants are identified as a communication and control tool of the MB and a fractal hierarchy of analogs of EEG is predicted. Living system is identified as a kind of Indra's net with biomolecules representing the nodes of the net and magnetic flux tubes connections between them.

The reconnection of magnetic flux tubes and phase transitions changing Planck constant and therefore the lengths of the magnetic flux tubes are identified as basic mechanisms behind DNA replication and analogous processes and also behind the phase transitions associated with the gel phase in cell interior. The braiding of magnetic flux makes possible universal memory representation recording the motions of the basic units connected by flux tubes. Braiding also defines topological quantum computer programs updated continually by the flows of the basic units [K4, K3, K94]. The model of DNA as topological quantum computer is one application. In ZEO the braiding actually generalize to 2-braiding for string world sheets in 4-D space-time and brings in new elements.

3. ZEO makes possible a p-adic description of intentions and cognitions and their transformations to action. Time mirror mechanism (see **Fig.** <https://cutt.ly/DcDKyTj>) based on sending of negative energy signal to geometric past would apply to both long term memory recall, remote metabolism, and realization of intentional acting as an activity beginning in the geometric past in accordance with the findings of Libet. ZEO gives a precise content to the notion of negative energy signal in terms of zero energy state for which the arrow of geometric time is opposite to the standard one.

The associated notion of causal diamond (CD) is essential element and assigns to elementary particles new fundamental time scales which are macroscopic: for electron the time scale is 1 seconds, the fundamental biorhythm. An essentially new element is time-like entanglement which allows to understand among other things the quantum counterparts of Boolean functions in terms of time-like entanglement in fermionic degrees of freedom.

4. The assignment of dark matter with a hierarchy of Planck constants gives rise to a hierarchy of macroscopic quantum phases making possible macroscopic and macrotemporal quantum coherence and allowing to understand evolution as a gradual increase of Planck constant.
5. One can also understand genetic code. The model for dark nucleons leads to a surprising conclusion: the states of nucleons correspond to DNA, RNA, tRNA, and amino-acids in a natural way and vertebrate genetic code as correspondence between DNA and amino-acids emerges naturally [L5, L19]. This suggests that genetic code is realized at the level of dark nuclear physics. The chemical realization would provide only a secondary representation of the code.

The recent findings support the view that the genetic code is actually universal and realized at the fundamental level in quantum TGD. Hitherto unknown realizations in living matter are suggestive [L37]. Second realization of the genetic code would be associated with communications using dark photons. It would be in terms of dark photon triplets defining 3-chords of light and realized in terms of icosahedral and tetrahedral Hamiltonian cycles giving rise to a set of bio-harmonies having interpretation as correlates of emotions at the molecular level [L3, L34, L37]

### 3.1.2 Some questions

MB has roles as both sensory canvas and controller of the ordinary matter with standard value  $h_{eff} = nh_0 = h$  using EEG and its fractally scaled variants for these purposes. This raises some questions.

### Could magnetosphere be a living and metabolizing organism?

$h_{eff}$  is a measure for algebraic complexity and analogous to IQ.  $h_{eff}$  tends to be reduced spontaneously. Metabolic energy is needed to preserve the distribution of  $h_{eff}$  and also to drive self-organization.

Could one think that MB is a higher level organism utilizing energy arriving from the Sun. Could solar radiation and solar wind provide metabolic energy to the Earth's magnetosphere (MS) accompanied by "personal" MBs. Could MB also receive metabolic energy produced by photosynthesis at the surface of the Earth?

Could the rotating inner MS transfer energy from solar radiation and transfer it to the night-side of the Earth. Could also solar wind provide energy to magnetopause, plasma pause, plasma sheet and neural sheet which are self-organizing highly dynamical structures? Could these regions of the MS serve as a sensory canvas?

### Could the anatomy of the magnetosphere be regarded as a scaled variant of the anatomy of a vertebrate?

The anatomy of the MS (see the illustrations of <https://cutt.ly/kcDKzqL>) resembles that of a vertebrate. The TGD Universe is fractal and this inspires the question whether there is something deeper behind this resemblance: could the anatomy of the MS be scaled up anatomy of the organism? This would be natural if the "big" part of the personal MB assignable to the MS serves as a sensory canvas.

The correspondence need not be a strict scaling. Conformal transformations define a more general correspondence and the correspondence respecting only topology is even more general correspondence.

Could one gain useful insights by formulating this idea quantitatively? Could the scales of the body parts of the vertebrate(say human)body and MS correspond to each other at the order of magnitude level? Could the ratios of scales for the corresponding parts of the MS and human body be nearly the same?

The sensory canvas idea is discussed earlier at the level of the brain in [?, K42] but restricting the consideration to the cyclotron frequencies for magnetic fields involved with various parts of the MS. The distance of the part of the MS gives an upper bound for the frequencies involved with the communications between it and the biological body. Could one associate EEG bands with the parts of the MS? The frequency scale correspondence indeed predicts frequencies in EEG range and it is possible to assign EEG bands to the parts of the MS.

## 3.2 The structure of the magnetosphere of Earth

It is interesting to try to relate the model for sensory representations to the structure of Earth's MS. To achieve this, I will provide a brief novice's overview about the structure of MS. I will use partially TGD based language in which magnetic field lines are replaced by magnetic flux tubes and the formation of the plasma corresponds to the leakage of the supra currents from the magnetic flux tubes.

I will also briefly consider TGD based qualitative models for the phenomena, many of which are not well understood in Maxwellian theory. Examples of such phenomena are Alfvén waves which are not proven to result from Maxwellian theory, and magnetic dynamo of Earth whose working mechanism is not really understood. Also the mechanism of auroras becomes very concrete when field lines are replaced with flux tubes [K15].

### 3.2.1 Magnetosphere

Solar wind [F4, F22, F21] determines the large scale structure of the magnetic field of Earth to a high extent. The basic structural components are transition regions and regions between them.

1. At the bow shock the solar wind arriving at a supersonic velocity of 500 km/s encounters Earth's magnetic field and is transformed to a subsonic flow and dissipates energy inside magnetosheath where the plasma is denser and hotter than in the solar wind. The distance of the bow shock is roughly 12-14  $R$  ( $R$  denotes Earth's radius).

2. The shocked solar wind cannot penetrate Earth's magnetic field and a cavity called MS is formed. Interplanetary magnetic field and MS is separated by a transition region called magneto-pause, which is accompanied by a plasma mantle. At the day-side magneto-pause is at a distance of about 10 R but when the solar wind is particularly strong, it can move down to 6-7 R. At the night side MS is stretched into long cylindrical magneto-tail of length about 1000 R and radius about 20 R.

MS consists of clearly separated regions with widely different densities and temperatures. The main division is into the inner and outer MSs. In the inner MS (also known as plasma sphere) magnetic field lines are co-rotating with the Earth: in the outer MS they are stationary.

Boundaries are the regions at which self-organization typically occurs.

1. Magneto-pause contains an ionic current determined by the discontinuity of the magnetic field and orthogonal to it. This region is highly dynamic.
2. The boundary between inner and outer MSs is known as plasmopause. Also this region is dynamical and its shape and size varies as response to solar wind. The analog is liquid is the boundary between two compressible liquid flows: other flow is rotating and other flow stationary.
3. Outer MS consists of a plasma sheet, which is between magnetic lobes carrying magnetic fluxes, which have opposite directions and are bounded by the magnetopause. In the plasma sheet the magnetic flux flows between the northern and southern lobes to give rise to closed field lines. Neutral sheet is in the equatorial region and starts at  $10 \pm 3R_E$ . Also this region is dynamic.

Both magnetopause, plasma pause and neutral sheet are expected to be highly dynamical self-organizing regions and are especially interesting from the point of view of magnetospheric consciousness.

### 3.2.2 Outer magnetosphere

#### Magnetic lobes

The outer MS at the night side, magneto-tail, consist of northern and southern magnetic lobes which are cavities having very low ionic density of about .01 ions per cubic cm. The low density can be understood as resulting from the absence of the solar wind in this region. By Maxwell's equations the magnetic field is approximately constant in the region where the flow lines are parallel (if sources can be neglected). According to [F3] the value of the magnetic field is about 30 nT in the interior of the lobes. The relatively strong magnetic field inside lobes serves as a magnetic energy battery feeding energy to the plasma sheet.

Magneto-tail is a cylindrical structure with radius of order  $R_m = 20R$ . Magnetic lobes extend up to  $r \sim 1000R$ . The magnetic field lines remain actually closed. In the TGD framework this means the existence of a closed supra-current circuitry formed by the magnetic flux tubes.

#### Plasma sheet and magneto-pause

Magnetic lobes are separated by a plasma sheet in the equatorial plane consisting of hot ( $5 \times 10^6$  K), low density plasma (.3-.5 ions/cm<sup>3</sup> as opposed to .01 ions/cm<sup>3</sup> inside lobes) with magnetic field  $\sim 10$  nT. Plasma sheet extends from  $8R$  to about  $60R$  and has thickness of order few  $R$ , and gets thinner with increasing distance. Plasma sheet disappears at the so called neutral point, where the magnetic field vanishes. In the plasma sheet the magnetic flux from the southern lobe flows to the northern lobe. Near the Earth plasma sheet reaches the high latitude auroral ionosphere. The value of the magnetic field immediately above the magnetic sheet is 20 nT.

In the TGD framework the plasma sheet can be seen as resulting from the leakage of the supra currents from the magnetic flux tubes of Earth's magnetic field to a larger space-time sheet. This supra-current leakage would be caused by the inertia of the ions and electrons in the region where the magnetic flux tubes are highly curved. The leakage occurs also in the magneto-pause, where the tangential component of the magnetic field is discontinuous and a surface current orthogonal to  $B$  generating the discontinuity flows.

In the magneto-pause the magnetic flux tubes of the inner and outer region are parallel. The reconnection of the parallel flux tubes of the magnetic fields of Earth and Sun allows the transfer of the ions of the solar wind to the MS. Magneto-pause is accompanied by a plasma mantle, which could be partially due to the leakage of ions to a larger space-time sheet accompanying the reconnection process.

There is a convective flow of ions towards the plasma sphere along the plasma sheet. In the TGD framework this motion must take place at a larger space-time sheet or involves a hopping between magnetic flux tubes: in both cases a breaking of the proposed super-conductivity is implied.

Plasma sheet also has a boundary layer in which the tangential component of the magnetic field is discontinuous. This requires a surface current orthogonal to the axis of the sheet. This current would result as the ions from the magnetic flux tubes leak out from flux tubes to a larger space-time sheet by their inertia in the highly curved portion of the flux tube caused by the tangential discontinuity.

### Cusps

Southern and northern cusps are funnel-shaped regions which on the day side consist of closed highly compressed flux tubes of dipole field and on the night side of almost open flux tubes stretched deep into the magnetospheric tail. In this funnel magnetic field is orthogonal to the magneto-pause and the magnetic flux tubes of the solar magnetic field can penetrate the MS. This implies that solar plasma contained in the solar magnetic field lines penetrates deeply into the magneto-tail by reconnecting with the field lines of Earth's magnetic field near poles. This gives rise to auroras [F23].

Reconnection can be seen as resulting from the penetration of the solar magnetic flux tubes at the upper boundary of the magneto-pause along the plasma sheet to highly stretched flux tubes along the boundary of the plasma sheet. The transformation to open flux tubes can happen only if the solar flux tubes reconnect with the flux tubes of the solar magnetic field penetrated into the plasma sphere. Thus auroras can be seen as a phenomenon involved with the boundary between plasma sheet and lobes.

Cusps, and to some extent also plasma mantle, serve as a channel along which the solar wind feeds "magnetometabolic" energy to the MS needed to run the geodynamo system [F1] (the notion of super-conducting geodynamo will be introduced later). The dipole field generated solely by the convective currents in Earth interior would die out in a few thousands of years. The field inside lobes serves as a storage of magnetic energy and is recharged by the energy of the solar ions leaking into the magnetic tail in the reconnection process. One could see the cusps also as a communication channel between solar and Earth's magnetic structures, kind of magnetic "ears" of magnetic Mother Gaia.

### 3.2.3 Basic structure of the inner magnetosphere

Inner MS is a toruslike structure whose extension varies between  $4R$  (day side) and  $8R$  (night side). In the inner MS the typical density is about 1 ion per cubic centimeter.

Inner MS is bounded by a transition layer of thickness of  $\sim R$  (magneto-pause). In this region the density of the ions drops rapidly.

Inner MS contains plasma sphere whose radius varies in the range  $2R$ - $4R$  at day side and  $2R$ - $6R$  at night side. Plasma has an ionospheric origin. The density of the cold plasma consisting mainly of protons ( $T \sim 1$  eV) sphere varies in the range  $10 - 10^3$  ions/cm<sup>3</sup>, whereas the temperature is  $\sim 5 \times 10^3$  K. The cold, dense plasma of the plasma sphere is frozen around magnetic flux lines which co-rotate with Earth.

In the TGD framework this means that flux tubes co-rotate and thus change shape. In the equatorial plane the density of the plasma sphere drops sharply down to  $\sim 1$  ions/cm<sup>3</sup> at  $r = 4R$ . This transition region is known as a plasma pause. During magnetic storms the outer radius decreases since the pressure of the solar wind compresses the plasma sphere. The day-night variation of the shape of the plasma sphere is rather small. Within this region the magnetic field in a reasonable approximation has dipole shape with radiation belts forming an exception.

### 3.2.4 Radiation belts and ring currents

Plasma sphere (i.e. inner magnetosphere) contains the inner and outer van Allen radiation belts [F2] (extending from  $2R$  to  $4R$  at the day side and from  $2R$  to  $9R$  at the night side). Inner radiation belt extends from distance  $.2R_E$  to  $2R_E$ . Outer radiation belt extends from distance  $3R_E$  to  $10R_E$  and is regarded as part of non-rotating outer MS. Both the inner and outer belts extend up to latitude of 60 degrees. The boundaries of the belts follow magnetic field lines except at the Northern and Southern tips. This region contains ring currents.

One of the functions of the radiation belts is to prevent the penetration of the biologically harmful high energy cosmic rays to the ionosphere. In fact, the inner protonic belt results from the decay of the cosmic ray neutrons to protons. Second function (in TGD universe!) is to act as a part of a controlled dynamo system giving rise to the MS of Earth (for the standard theory of geodynamo see [F1]).

It has been found that the energies of the ions in the radiation belts are much higher than one might expect [F5]. This might be understood if part of the ions runs as supra currents along the magnetic flux tubes. Super-conductivity is broken only by the leakage of the supra currents from the magnetic flux tubes. This could explain the success of magnetohydrodynamics based on the assumption of effective super conductivity.

#### Inner radiation belts

There are actually two separate inner radiation belts: the one containing protons and the one containing electrons. Protons in the inner belt have energies at 10-100 MeV range and readily penetrate space crafts. The inner radiation belts are concentrated around the equator in the range  $(1.1 - -3.3)R$  (these numbers depend on the conventions used and should not be taken too literally). In the protonic belt the maximum of the flux density is at  $2R$ : in the electronic belt the maximum flux density is at about  $1.4R$ . The inner belts are relatively stable and there is no night-day difference. The inner belts feel magnetic storms and vary with the 11 year period of solar activity.

What is interesting is that the inner belts are also sensitive to human technology. The inner belt has lowered above the East Coast of US from 300 km to 10 km [J3]: this process is associated with power transmission along magnetic field line and the usage of the ionosphere-resonance frequency 60 Hz as the frequency of household current.

During the last decade two new belts have formed inside inner belts [F4], [J3]. The new electronic belt has maximum electron flux at  $r \sim 2R$  (earlier flux maximum was at  $r \sim 1.4R$ ). The second newcomer consists mostly of  $O^+$  ions but contains also  $He^+$ . This process has been seen as a part of magnetic re-self-organization process occurring in the scale of the entire helio-magnetosphere implying rapid changes of planetary MSs [J3].

#### Outer radiation belt

Outer belt contains mainly electrons with energies up to 10 MeV and is produced by the injection of charged particles during geomagnetic storms. This makes the outer belt much more dynamical than the inner one. The cross section of the outer radiation belt is banana shaped. The outer belt ranges from  $3R$  to  $6R$  (at night side). The maximum for the density of electrons above MeV energy occurs at  $4R$ .

#### Ring currents

Radiation belts contain ring currents. Electronic ring current rotates in the same direction as Earth whereas protonic current runs to the opposite direction. In the outer belt only electronic current is present. Quiet time ring current in the inner electronic *resp.* protonic belts consist mainly of hydrogen ions *resp.* electrons but during magnetic storms also  $O^+$  ions are present (note however the presence of the new  $O^+$  belt). Ring current has the effect that the magnetic field gets stronger at the outer side of a given belt and weaker at the inner side.

### 3.3 Frequency scales associated with the magnetosphere

#### 3.3.1 Cyclotron frequencies in magnetic lobes and plasma sheet

The values of important magnetic transition frequencies in various regions of the MS are crucial if one wants to construct a general vision about sensory and motor representations at the magnetic sensory canvas. In the inner MS dipole approximation allows to estimate the spatial dependence magnetic transition frequencies.

In magnetosheath and magnetolobes the average values of the magnetic field are 10 nT and 30 nT respectively. Immediately above the magnetosheath the value of the magnetic field is 20 nT. Magnetosheath could thus allow place coding by the magnetic transition frequency scale whereas magnetolobes are not tailor made for this purpose. Note that the thickness of the magnetic flux tubes in the field of 10 nT =  $2^{-9}B_E$ ,  $B_E = 5 \times 10^4$  nT is from the quantization of magnetic flux equal to about 55  $\mu\text{m}$  and thus corresponds to a biological length scale. This length scale corresponds to the p-adic length scale  $L(11, 16)$  ( $L_p(n) = p^{(n-1)/2}L_p$ ). Already this encourages to think that plasma sheet might be involved with bio-control.

The strength of the interplanetary magnetic field depends on the intensity of solar wind and varies between .2 – 80 nT and has average of 6 nT. Interestingly, the maximum value 80 nT corresponds to the p-adic length scale  $L(173) = 20 \mu\text{m}$ .

##### 1. Proton

In the case of proton there are three especially interesting frequencies to be considered: cyclotron frequency  $f_c = eB/2\pi m_p$ , spin flip frequency and the frequency of combined spin flip and  $\Delta n = 1$  transitions. The frequencies of these transitions in magnetic field of  $.5 \times 10^{-4}$  T are  $f_c = 300$  Hz,  $f_{flip} = 838$  Hz,  $f_1 = 532$  Hz and  $f_2 = 1138$  Hz. In a field of 10 nT the values of the transition periods  $T = 1/f$  are  $T_c = 16.7$  sec,  $T_{flip} = 6$  sec,  $\tau_1 = 9.3$  sec, and  $\tau_2 = 4.4$  sec. For a field of 30 nT the values are obtained by dividing by three. Plasma sheet contains also  $He^{++}$  and  $He^+$  ions and for these the cyclotron times are  $2\tau$  and  $4\tau$ . For  $O^+$  ion which is also present cyclotron time varies between 1 min 20 s and 4 minutes. All these time scales are typical time scales of human consciousness. For the interplanetary magnetic field protonic cyclotron times are 13.9 min, 27.8 sec, and 2.1 sec for the minimum, average, and maximum respectively.

##### 2. Electron

For electrons the cyclotron frequency is 282 Hz for 10 nT so that electronic cyclotron transitions cannot represent ionic cyclotron transitions in brain (if they occur at the flux tubes of Earth's magnetic field!). Spin flip combined with cyclotron transition represents however an important exception. In this case the non-vanishing transition frequency is due to the anomalous magnetic moment of electron and the frequency in the reference field of  $.5 \times 10^{-4}$  T is 2255 Hz. This gives  $T(e) = 2.24$  sec. Note that also  $n = 3$  protonic cyclotron transition gives rise to nearly the same period.

It is interesting to notice that these time scales are important time scales of human consciousness and that both protonic spin flip time scale and  $T(e)$  nearly half of the 5 second time scale associated with the Comorosan effect [I40, I13] discussed in [K99]. If Earth's magnetic field is accompanied by dark flux sheets in entire MS carrying field  $B_{end} = 2B_E/5$ , then the value of  $T(e)$  would become  $T(e) = 5$  seconds for  $B_E = 11.2$  nT.

To sum up:

1. The average magnetic field in plasma sheet corresponds to a definite p-adic length scale.
2. The mysterious time scale of the Comorosan effect pops up as a basic magnetic transition time in magnetic lobes and plasma sheet and is related to bio-control by enhancing catalytic rates: it is however essential that the “dark” counterpart  $B_{end} = 2B_E/5$  of  $B_E$  associated with living matter is in question.
3. Plasma sheet is found to be a complex self-organizing system with the velocity distribution of ions representing complex features (such as “eyes” and “wings” !) [F11].

These findings force to seriously consider the possibility that plasma sheet and magnetopause and perhaps even magnetic lobes might perform high level bio-control utilizing MEs and

Region	$R/R_E$ range	$f/Hz$ range	EEG bands
plasma sheath	...-1000	...-0.049 (20 s)	
inner MS	1-10	49.0-4.9	$\theta, \alpha, \beta, \gamma$
plasmopause	4.0-5.0	12.5-10.0	$\theta, \alpha$
inner van Allen belt	.2-2.0	75.0-7.5	$\theta, \beta, \gamma$
outer van Allen belt	3.0-10.0	5.1-1.5	$\delta$
day-side magnetopause	8.0-10.0	6.25-4.9	$\theta$
night-side magnetopause	10.0-200.0	4.9-.2 (5 s)	$\delta$
plasma sheet	10.0-60.0	4.9-.82	$\delta$
neutral sheet	7.0-13.0	7.0-3.8	$\delta$

**Table 3.1:** The frequency scales  $f$  assignable to the size scales  $R$  of various regions of the MS (MS)

supra-currents along magnetic flux tubes forming the extension of the endogenous magnetic circulation to the entire MS.

### 3.3.2 Estimates for the natural frequency scales assignable to various parts of the magnetosphere

The part of MS having distance  $R$  from the center of Earth corresponds naturally to frequency scale  $f = 1/R$ . This allows a rough estimate for the frequencies needed for the communications between various parts of MS. What is highly non-trivial is that these scales are in EEG range and that one can even assign EEG bands to the regions of MS.

The basic correspondence is given by the formula  $f = 1/R$ : favored frequencies are harmonics of this fundamental frequency. Taking the Schuman resonance frequency 7.8 Hz as reference and Earth radius as length unit, one has

$$\frac{f}{Hz} = \frac{R_E}{R} \times 2\pi \times 7.8 = \frac{R_E}{R} \times 49$$

**Table 3.1** summarizes the frequency scales assignable to the size scales of various regions of the MS.

Some remarks are in order.

1. Plasmopause corresponds to frequency range 10-12.5 Hz containing alpha band and also frequencies often included in theta band.
2. Neutral sheet corresponds to the range 3.8-7.0 Hz above delta band.
3. The outer van Allen belt corresponds to delta band in EEG. Therefore also the delta band of EEG dominating during deep sleep appears naturally also at the day-side. Note that outer van Allen belt belongs to the non-rotating outer magnetosphere.
4. Night-side magnetopause and plasma sheet contain frequencies in delta band which dominates during deep sleep.
5. The lower bound for frequencies from the size of magnetopause at night-side corresponds to the period 5 s assignable to the Comorosan effect [I40, I13] [K99].
6. Day-side regions of the MS correspond to  $\theta, \alpha, \beta$  and  $\gamma$  bands.

These findings encourage to ask whether the communications between the brain (and possibly also other parts of body, at least central nervous system) and MS could be in terms of EEG.

Region	$y = R/R_E$	$r$
Earth	1.0	3.5 mm
plasmopause	4.0-5.0	1.4-1.7 cm
inner van Allen belt	0.2-2.0	.84-7.4 mm
outer van Allen belt	3.0-10.0	1.3-4.2 cm
day-side magnetopause	8.0-10.0	2.8-3.6 cm
night-side magnetopause	10.0-200.0	3.6-80.0 cm
plasma sheet length	10.0-60.0	3.6 cm-21.5 cm
plasma sheet thickness	5.0-10.0	1.8 cm-3.6 cm
neutral sheet	7.0-13.0	2.4-4.6 cm

**Table 3.2:** The scaled down radii  $r = .5 \times 10^{-9}R = y \times 3.5$  mm for various regions of the MS (MS) with radius  $R = yR_E$

### 3.3.3 Could one regard magnetosphere as a scaled variant of biological body?

Sensory canvas hypothesis allows two options. MS could be the sensory canvas for the brain or for the entire nervous system and body. The structure of the MS suggests that it could correspond to a sensory map of the entire body.

1. Inner MS could be the sensory canvas for the brain or part of it and Earth perhaps to some nucleus, say pineal gland.
2. Magnetopause would correspond to skin and magnetic lobes would correspond to to the interior of the body. Plasma sheet would correspond to the interior of the body and the neutral sheet at which the direction of magnetic field changes to the spine.
3. Left and right body parts would correspond to northern and southern magnetic lobes.
4. The inner MS could correspond to the part of the nervous system assignable to the head and neck and involve cranial nerves associated with vision, hearing, and smell. Outer MS could correspond to tactile senses.
5. The neutral sheet at the night side of the outer MS could correspond to the spinal cord, which has dorsal and ventral parts which could correspond to flux tubes with opposite fluxes.
6. Plasma sheet would contain the spinal nerves leading to the magnetopause as the counterpart of the skin.

The frequency-distance correspondence suggests a rather detailed correspondence between EEG bands and magnetospheric regions. Delta band dominating during deep sleep should correspond to the magnetopause, plasma sheet, and neutral sheet.

A quantitative formulation for this hypothesis is in terms of fractality. The scales of the body and corresponding parts of the MS should be in constant proportion and the ratios of the corresponding scales should be the same for body and MS.

Magnetopause has thickness  $D \simeq 1000$  km. Magnetopause corresponds to skin and the first guess is that the ratio of smallest and largest length  $L = 200R_E$  associated with the MS has same value as the corresponding ratio for human body. One has  $D/L = 1340$ . The ratio the human body length  $l \sim 1$  m of the human skin thickness  $d \simeq .5$  mm is  $l/d = 2 \times 10^3$ . The order of magnitude is same.  $D/L = 2 \times 10^3$  would give a perfect fit.

$R_E = 6.37D$  and the ratio  $x = d/D = .5 \times 10^{-9}$  allows to scale down various scales  $L = yR_E = 6.37yD$  of MS to  $xL = y \times 3.5$  mm to see whether they are consistent with the corresponding scales of body suggested by the above intuitive considerations.

**Table 3.2** summarizes the scaled down length scales for various regions of the MS.

Using these scaled down estimates one can try to identify the correspondence between body parts of human body and parts of MS.

Region	$d$	$R$
DNA codon	1.0 nm	29 cm
lipid layer cell membrane	2.5-5.0 nm	.73-1.45 m
tubulin	10.0 nm	2.9 m
cell nucleus	1.0 $\mu\text{m}$	290 m
cell	2.5-25.0 $\mu\text{m}$	.73-7.3 km
neuron	2.5-100.0 $\mu\text{m}$	.73-29.2 km

**Table 3.3:** The scaled up size scales  $R = .29 \times 10^9 d = y \times 29$  cm for basic biomolecules, cells, and neurons with size scale  $d = y$  nm

1. Pineal gland has radius 3.7 mm which is not far from the size scales 3.5 cm assigned to Earth.
2. Most scales correspond to the scales of brain nuclei which have diameter of 5 cm. Apart from pineal gland these structures of MS are expected to appear as pairs associated with Northern and Souther magnetic lobes.
3. Night-time magnetopause would correspond to a structure with radius .76 m and could correspond to the entire body. Plasma sheet corresponds to size scales in the range 3.6 – 21.5 cm, perhaps the upper limit corresponds to brain size scale.

One can also ask whether the length scales of DNA and proteins, cell membrane thickness, size scale of cell nucleus, and the range of size scales for cells and neurons could have counterparts at the level of MS and whether one might identify possible candidates for the counterparts for these structures.

Given the size scale  $d$  of the molecular or cellular structure the scaled up system should have size scale  $R = .29 \times 10^9 d$ . System with size 1 nm - roughly the size scale of the DNA codon - corresponds to a system with a size scale 29 cm not far from the size of the brain hemisphere. DNA letter with size scale .33 nm corresponds to scale 9-7 cm. Could the interpretation of the counterpart of the DNA codon as brain hemisphere make sense? Could the brain consisting of three parts be seen as a counterpart of the genetic codon with 3 letters?

The assignment of genetic codon with the brain does not seem to make sense but here an old idea about a hierarchy of codes is suggestive. Ordinary genetic code would correspond to Mersenne prime  $M_7 = 2^7 - 1$  and have  $2^6$  codons. Memetic code assignable to Mersenne prime  $M_{M_7} = M_{127} = 2^{127} - 1$  would have  $2^{126}$  codons representable also as sequences of 21 ordinary genetic codons. One could say that one has an abstraction hierarchy in which genetic code corresponds to 64 statements and memetic codons to statements about these statements.

Individual brains do not certainly give rise to analogs of DNA sequences. Here however the notion of magnetic body (MB) providing an abstracted representation of the brain and the biological body is suggestive. The images of neurons at MB near to each other at MB need not be near to each other at the brain level: it is enough that they are functionally similar. This would realize the analog of RAM.

Pietch [J27] found that the shuffling of the neurons of the salamander brain does not lead to the loss of its functionality. This supports the view about the brain as an analog of RAM. In an analogous way human and perhaps also other than human brains could serve as analogs for the codons of memetic code mapped to the MB to form linear or even higher-dimensional analogs of the genome. Cultural evolution could mean the emergence of the memetic code.

One can also consider other size scales. **Table 3.3** summarizes the scaled up size scales for basic biomolecules, cells, and neurons.

From the table one finds that the lipids of the lipid layers of cell membrane still correspond to human size scales. This inspires the crazy idea that perhaps humans and possibly other higher animals correspond at the level of MB to analogs of lipids for cell membrane like structures. Larger structures - such as cell and neuron - could correspond to social structures responsible for collective consciousness generated in the cultural evolution.

### 3.4 The model for $h_{eff}$ preserving communications based on variable value of $\beta_0$

Nottale's gravitational Planck constant  $\hbar_{gr} = GMm/v_0$  contains the velocity parameter  $v_0$  as the only parameter. In the perturbative expansion of the scattering amplitudes  $\beta_0 = v_0/c$  appears in the role of fine structure constant.

There is however a problem.

1. The model for the effects of ELF radiation on vertebrate brain inspired by a generalization of Nottale's hypothesis by replacing the total mass  $M$  in the case of Earth by  $M_D \simeq 10^{-4}M_E$  suggests that in this case the dark particles involved couple only to a part of mass identifiable as dark mass  $M_D$ .
2. Since only  $GM$  appears in the basic formulas, the alternative option is that the value of  $G$  is reduced to  $G_D$ . This conforms with the fact that in the TGD framework  $CP_2$  length is the fundamental parameter  $G$  is a prediction of the theory and therefore can vary.
3. A further option is that the parameter  $\beta_0 = v_0/c \leq 1$  is variable and equals to  $\beta_0 = 1$  or to a value not much smaller than 1, say  $\beta_0 = 1/2$ .

These three options are discussed in [L40]. The cautious conclusion is that the third option is the most plausible one. In the sequel I will develop a model for the communications between dark matter phases with  $h_{eff} = nh_0$  satisfying  $h_{eff} = \hbar_{gr}$  based on the third option. One can consider two options for the communications depending on whether the value of  $h_{eff}$  changes as (for instance) in the communications between dark and ordinary matter or whether it is preserved.

1. If the value of  $h_{eff}$  can change, energy conservation for  $E = h_{eff}f$  allows energy resonance whereas the frequency changes. The simplest option is that the dark photon transforms to say ordinary photon with the same amplitude
2. If the value  $h_{eff}$  is preserved, one has both energy and frequency resonance. In the case of cyclotron radiation, the simultaneous occurrence of energy and frequency resonances poses strong conditions on the values of the magnetic fields, the values of charged particle masses, and the parameter  $\beta_0$  at the ends of the communication line.

#### 3.4.1 Conditions for frequency - and energy resonance

The condition that the frequency is the same at both ends implies for cyclotron frequencies  $f_c = ZeB/2\pi m$  the condition

$$\frac{Z_1 B_1}{m_1} = \frac{Z_2 B_2}{m_2} . \quad (3.4.1)$$

For  $h_{eff} = \hbar_{gr}$  the condition that the cyclotron energy  $E_c = GMZeB/v_0$  at both ends is same implies

$$\frac{Z_1 B_1}{v_{0,1}} = \frac{Z_2 B_2}{v_{0,2}} . \quad (3.4.2)$$

Together these conditions give

$$\frac{m_1}{m_2} = \frac{Z_1 B_1}{Z_2 B_2} = \frac{\beta_{0,1}}{\beta_{0,2}} . \quad (3.4.3)$$

For instance, if the two particles are proton and electron, one obtains

$$\frac{\beta_{0,1}}{\beta_{0,2}} \simeq \frac{m_e}{m_p} .$$

This ratio is consistent with the values  $\beta_{0,2} = 1$  and  $\beta_{0,1} = 2^{-11}$  in the accuracy considered. Is this a mere accident?

### 3.4.2 Resonance conditions for communications from the Earth's surface to the magnetosphere?

The simplest option is that the interacting particles have the same values of mass and  $\beta_0$  and magnetic fields are identical. This is achieved if the flux tubes have constant thickness. Whether this is the case is not clear.

However, the idea that the flux tube picture about magnetic fields is locally consistent with the Maxwellian view inspires the question whether also the magnetic field strength at the flux tubes of  $B_{end}$  behaves like  $B_{end} \propto 1/r^3$  as  $B_E$  in dipole approximation behaves.

$B_{end}$  is by flux conservation proportional to  $1/S$ , where  $S$  is the area of the flux tube. One would have  $S \propto r^3$ . The constancy of  $B_{end}/m$  would suggest  $m \propto 1/r^3$ . If the charged particles are ions characterized by the  $A/Z$  ratio.

This would suggest that the regions of tubes/sheets in frequency resonance are at distances

$$\frac{r}{r_0} = \left(\frac{Z}{Z_0}\right)^{-1/3} \left(\frac{A_0}{A}\right)^{-1/3}$$

for ions  $Z_0, A_0$  at the surface of the Earth. The heaviest ions would be nearest to the surface of Earth. Energy resonance condition

$$B_{end}(r)/\beta_{0,2} = B_{end}(R_E)/v_{0,1}$$

would give the additional condition

$$\frac{\beta_{0,2}}{\beta_{0,1}} = \left(\frac{R_E}{r}\right)^3 = \frac{Z}{Z_0} \times \frac{A_0}{A} .$$

$\beta_0$  would be quantized and would decrease with the distance.

### 3.4.3 Magnetosphere as sensory canvas

TGD leads to a model of the "personal" magnetic body (MB) as being associated with the Earth's MS. Different regions of the body and brain would be mapped to regions of the MS, which would give rise to sensory representations at the personal MB [K44, K42]. Personal MB, which would have size scale of at least of the Earth's MS, would also control biological body.

1. An interesting finding relates to the values of the magnetic field  $B_{end} \simeq 2B_E/5$  (perhaps identifiable as the monopole flux part of  $B_E$ ) and the value of  $B \sim 10$  nT in the magnetotail at the night-side of the Earth.

One has  $B/B_{end} \sim 2^{-11}$  so that for dark proton-dark electron communications between the Earth's surface and this region of outer MS the resonance conditions would be satisfied for  $\beta_0 = x$  and  $\beta_0 = 2^{-11}x$ , where  $x < 1$  not far from unity.

2. Could the parameter  $\beta_0$  characterize particles and act as a tunable control parameter allowing to achieve energy resonance? Also the values of  $B$  are tunable by changing the thickness of the flux tubes as a kind of motor action of MB.

This idea can be applied to the  $h_{eff}$  preserving communications between biological body and the MS of the Earth.

1. The quantum coherence condition suggests that the communications are optimal when the wavelength of dark photon is larger than the distance considered:  $\lambda > r$  or equivalently the frequency satisfies  $f \leq c/r$  (one has  $c = 1$  in the units used). If the structure of the MS has distances from the Earth's surface below  $r_{max}$  then the frequencies  $f \leq 1/r_{max}$  are optimal.
2. Given the distance  $r_{max}$  and assuming  $B = B_{end}$  at the surface of Earth, one obtains for the cyclotron frequencies the condition

$$f_c = \frac{ZeB_{end}}{2\pi m} \leq \frac{1}{r_{max}} .$$

For instance, EEG frequency 10 Hz corresponds to  $3 \times 10^7$  m. The cyclotron frequency of DNA sequence does not depend on its length and composition since DNA has constant charge per unit length. One has  $f_c \simeq 1$  Hz so that the corresponding distance is  $r = 3 \times 10^8$  m, that is  $r = 46.9R_E$ .

**Remark:**  $B_{end}$  probably has a spectrum. Music experiences relies on frequency scale and if the audible frequencies correspond to cyclotron frequencies then  $eB_{end}/m$  is variable. This suggests that the spectrum of  $B_{end}$  covers at least the range of the audible frequencies spanning roughly 10 octaves [K65].

## 3.5 Further observations making bells ringing

There are direct observations suggesting that magnetosphere at the level of MB could be a quantum coherent system.

### 3.5.1 Magnetosphere as self-organizing system

ZEO is now in a central role in the understanding of self-organization [L26]. The new view about time predicts that time reversal occurs in ordinary ("big") state function reductions (BSFRs) occurring for dark matter at MB whose quantum coherence controls ordinary matter. This has several implications.

1. Dissipative processes occurring in reversed time direction looks like self-organization in the standard time direction. The dissipation of the time reversed system looks like extraction of energy from the environment - an active gain of metabolic energy.
2. Quantum criticality has a description in terms of quantum fluctuations with  $h_{eff} > h$  and homeostasis can be understood as self-organized quantum criticality. Dissipation makes possible for the system to stay near criticality contrary to what criticality means by definition.
3. A further implication is that BSFRs look in all scales for an observer with standard time direction like time averages of classical deterministic time evolutions leading to the final 3-D state of BSFR and associated with the final zero energy state. Hence the Universe looks classical in ZEO and the question about the scale in which quantum behavior transforms to classical becomes obsolete. The findings of Minev *et al* [L21] support this picture [L21].

The view that MS is a self-organizing system is supported by the observations accumulated about the magnetic self-organization of the solar system during the last decades reviewed in [J3]. According to this report we are living a period of transition basically due to a penetration of highly charged material from the interstellar space into the interplanetary space from an interstellar plasma structure containing various kinds of magnetic structures.

This energy feed is inducing various kinds of processes affecting not only the atmo-, iono-, and MSs of Earth but also solar and other planetary MSs. Also interplanetary transmitting properties are affected. The Schumacher-Levy comet, which for few years ago collided with Jupiter and among other things a induced plasmoid train and had dramatic effects on Jupiter's MS, is referred to as a "Comet" SL-9 in [J3]. I am not sure whether "Comet" was meant to suggest that SL-9 was actually a plasma magnetic structure from the interstellar space. There is also evidence that we are moving to a similar temperature instability that occurred about 10.000 years ago and which might have initiated the development of the bicameral society in turn leading to the modern society much later.

This process could be also seen as a re-self-organization and evolution of consciousness in solar length scale as a reaction to the encounter of heliospheric and interstellar magnetic intelligences. The penetration of interstellar plasmoid like structures to the interplanetary space through the solar magneto-pause could be interpreted as a failure of the magneto-immune system of the helio- MS. The interaction of the planetary MSs with these intelligent (benevolent?) plasmoid like structures would in turn induce the re-self-organization. Needless to say, the interaction of the two intelligences might have far-reaching consequences for the evolution of ordinary life.

### 3.5.2 Connection with the Comorosan effect

Comorosan effect means that the irradiation of living manner by visible light over a period which is a multiple of  $\tau_C = 5$  seconds implies enhanced catalytic activity [I40, I13]. According to private communication, this effect is not restricted to living or even organic matter. TGD explains the effect [K99] but the deeper explanation of the time scale of  $\tau_C = 5$  seconds has remained a longstanding challenge.

The 5 second time scale associated with Comorosan effect is the spin flip time scale associated with proton's  $\Delta n = 1$  cyclotron transition in the field of  $B_{end} = 13.32$  nT (which could correspond to the value of  $B_E = 5B_{end}/2 = 33.3$  nT in magnetic lobes).  $\tau_C$  is also associated with proton's  $\Delta n = 3$  cyclotron transition and the electronic cyclotron spin flip in the field of  $B_{end} = 2/5B_E = 11.2$  nT (plasma sheet). Lungs contain magnetic particles giving rise to  $\sim 10$  nT magnetic field and thus for  $B_{end} = 2B_E/5$  to  $n = 3$  protonic cyclotron transitions and electronic cyclotron spin flips in 5.5 second scale, which is very near to  $\tau_C$ . Perhaps the Comorosan effect is used by the outer MS to affect the behavior of living matter and lungs are involved with this process.

### 3.5.3 Plasma sheet as a "microchip"

Plasma sheet should be a seat for magnetospheric sensory representations in theta and delta bands and among other things provide a model of magnetospheric self. If the plasma sheet has this kind of role, it should manifest itself in its properties. The plasma sheet should be self-organizing, complex structure rather than a system near thermal equilibrium. In the TGD framework, the plasma sheet could also perform bio-control.

There is a fascinating finding about the "memory chip" character of the organization of the ionic velocity distribution in the plasma sheet [F11]. The belief was that the distribution is a Maxwellian thermal distribution but a complex organization of the number of ions as a function of speed and direction relative to the direction of the local magnetic field has been detected [F11]. By coloring the bins representing small volumes of the velocity space, one finds that 3-dimensional features like "eyes" and "wings" appear! The proposed interpretation is that these features code for the history of ionic currents.

One cannot exclude the possibility that these ionic currents could reflect even our sensory experiences. The prediction is that also other transition regions (in particular magneto-pause) should exhibit similar complex self-organization patterns. The simplest possibility is that the velocity patterns of ordinary electrons reflect the underlying pattern of dark matter at the dark magnetic flux tubes forming perhaps some kind of sensory representations.

## 3.6 Pollack effect, lightnings and ball lightnings

Ball lightning (see this) is a phenomenon challenging the standard physics. Years ago I wrote about ball lightning and identifying it as a plasmoid, a kind of a primitive life form analogous to a cell. When I learned from the experimental and theoretical work done during this millennium and decided to sharpen my views.

The analogs of ball lightning can be produced in laboratories in strong electric fields using an electric discharge from carbon electron to silicon wafer [D3]. Pure silicon is very rare in nature and appears in the forms of Si oxides, silicates, in particular  $\text{SiO}_2$  (see this). Quartz crystals and glass consist of silicon dioxide. In the experiment involving a silicon wafer the globules are divided into two groups: those having sizes in the range .2-.8 mm (high voltages) and .8-1.4 mm (low voltages). The sizes of ball lightning vary from a few millimeters to about 100 cm.

In DC voltage, the wafer decomposes to globules of various sizes. They can last as long as 6-8 second unlike sparks. The proposed explanation is that the globules are evaporated Si. Larger globules have at their surface silicate oxide assumed to be formed in the interaction with air. Larger balls have tube-like extrusions and smaller balls at their surface. They can also rotate and bounce: the energy should come from their decay as an exogenic process. There is evidence for the self-propulsion which brings in mind the motion of bacteria using cilia [D7].

Leo Vuyk has an article about these ball lightning-like objects containing a large number of illustrations (see this).

The theoretical proposal is that ball lightning [D9] (see this) is formed as the lightning strikes on the soil and  $\text{SiO}_2$  crystals evaporate and transform to Si and Oxygen. There is support for this from direct observations of the spectrum of ball lightning containing spectral lines assignable to the elements in the soil. The spectra associated with ordinary lightning do not contain similar lines. How the chemical reaction producing Si and  $\text{O}_2$  ions from  $\text{SiO}_2$  ions could take place is far from clear. A lot of energy is needed for this process to occur. Where does this energy come from?

There is also the so-called microwave theory of ball lightning. Microwave wavelengths vary in the range of 1 mm-30 cm as also the sizes of ball lightning. The ball lightning would correspond to microwave cavities with a dynamical size and shape.

In the sequel a TGD inspired model for the ball lightning-like structures in silicon and for the real ball lightnings is developed relying on the TGD view of space-time predicting fractality and inspiring the hypothesis that biosphere could be regarded as a system analogous to neuronal membrane and that lightnings could be analogous to nerve pulses, the identification of dark matter as phases with non-standard value of Planck constant allowing quantum coherence in arbitrarily long scales, the TGD view of quantum gravitation and its role in quantum biology [L48, L45], and the TGD inspired model of nerve pulse [L70].

### 3.6.1 TGD view of lightnings

The background for the TGD based model of lightnings and ball lightnings is provided by the TGD view of magnetosphere [K44, K42] [L36] that I have developed during the last decades. The magnetic bodies (MBs) of living systems and even the MB of the biosphere would be controlling agents. These MBs are predicted to have a hierarchical onion-like structure [L63, L64] (monopole flux tubes inside monopole flux tubes). They would carry dark matter as phases of the ordinary matter labelled by the value of effective Planck constant having a number theoretic interpretation. EEG and its possibly existing scaled variants would make possible the communications to and control by these MBs.

The TGD based view of ball lightning relies on the fractality of the TGD Universe suggesting fractality also at the level of the biosphere. This inspires the notion of the biosphere as an analog of the cell membrane. The TGD view of nerve pulse [K66] and its up-to-date version [L70] inspire the idea that lightning is a scaled up variant of nerve pulse.

#### Biosphere as analog of neuron

The fractality of the TGD Universe inspires the idea that the Earth ground-atmosphere pair as an analog of neuronal interior-exterior membrane. The background for this discussion is formed by the TGD view of magnetosphere [K44, K42] [L36]. The magnetic bodies (MBs) of living systems and even the MB of biosphere would be controlling agents. These MBs would have a hierarchical onion-like structure [L63, L64].

1. The Earth ground-atmosphere pair is analogous to the cell interior-cell exterior pair. The surface of the Earth is negatively charged and analogous to the cell interior. This negative charge creates an electric field of strength 100-300 V/m (see this). The height  $h$  for the clouds varies in the range .5-16 km. For a cloud at height of 10 km this corresponds to an electrostatic energy .1 – .3 MeV and for  $h=16$  km one has .48 MeV. In the case of electrons with rest mass of .5 MeV, these energies are relativistic and could relate to the observed relativistic energies associated with the lightning.
2. The thunder cloud (see ) has a positive charge near the top of the cloud and negative charge in the middle to lower part of the thunder cloud. At bottom there is a small positive charge known to be important. The negative charge of the cloud repels the negative charge at ground so that ground becomes positively charged below the cloud. Does this induce a local depolarization of the ground-cloud system as the analog of cell membrane?

This raises an objection against the idea that dark protons are at gravitational monopole flux tubes and that their energies are of the order of the gravitational binding energy in the gravitational field of Earth of order .5 eV. If dark protons experience the Coulombic force of Earth, their Coulomb energies are in the range .8-2.4 MeV below the ionosphere at height

$h_I = 80$  km, which defines the minimum height of the lower boundary of the ionosphere. The problem disappears since the dark protons at monopole flux tubes are at much larger heights, where the electric field of the Earth vanishes. However, the dark matter at parts of the MB at heights smaller than  $h_I$  the electric energy dominates and their role in biology should be very different.

3. Neuronal membrane is hyperpolarized and the nerve pulse is initiated when depolarization takes the membrane potential below a critical value. Could lightning be seen as an analog of nerve pulse induced when cloud-ground depolarization takes place? Thunder storm would be analogous to a conduction of a nerve pulse pattern.

### TGD view of nerve pulse

The TGD based model of nerve pulse [L70] relies on the Pollack effect inducing a charge separation between cell interior/exterior and its MB.

1. Pollack effect [I25, I9, I43, I36] occurs in water in the presence of a gel phase. Also energy feed is required and in standard Pollack effect solar radiation provides it. The Pollack effect generates what Pollack calls the fourth phase of water. It has the effective stoichiometry  $H_1.5O$  and every fourth proton of water has gone somewhere. In the TGD based model they would transform to dark protons at the gravitational MB of the Earth.
2. Pollack effect inside the cell would generate negatively charged EZs making the cell negatively charged. The dark protons would reside at the gravitational MB of Earth having astrophysical size and are therefore effectively outside the system. The negative charge of EZs induces positive polarization charges in the cell exterior. The properties of EZ suggest that second law holds in a reversed time direction and large scale quantum coherence zero energy ontology (ZEO) [K100], predicting that the arrow of time changes in the ordinary state function reductions, can explain this.
3. In the nerve pulse generation, the reverse Pollack effect would occur and neutralize the negative charge of the cell interior locally [L70]. This would induce a local depolarization. The reverse Pollack energy generates dark photons and is received by the water in the neuron exterior. This would induce Pollack effect in the cell exterior and generate a negative charge as EZ outside the cell so that membrane potential would change its sign temporarily. An effective charge transfer induced by the Pollack effect and its reversal occurs: a kind of quantum flip-flop is in question. The possibly Ohmic ionic currents associated with the nerve pulse are generated as a consequence but could be seen as a side effect rather than a cause of the nerve pulse.
4. In zero energy ontology (ZEO), nerve pulse corresponds to two pairs of BSFRs ("big" state function reductions) corresponding the reduction of membrane potential to its negative and the reversal of this process [L70]. Each pair involves a temporary change of arrow of time: this would conform with the formation of EZs.

### Lightning as an analog of nerve pulse?

Could lightning and nerve pulse be generated by the same mechanism?

1. The fractality of the TGD Universe inspires the proposal that the Earth's biosphere and its MB [K44, K42] [L36, L63, L64] are analogous to a cell membrane or even neuronal membrane or possibly a collection of basic units analogous to those of neuronal membranes. In the lightning strike, a charge separation between ground and its MB would transform to a charge separation between cloud and its MB. Lightning would be induced by the depolarization just as in the case of neuronal membrane.

The assumption distinguishing sharply between TGD and standard physics is that the primary charge separation does not occur between cell interior and exterior but between interior/exterior and its MB.

2. In the initial, rather stationary situation, the Pollack effect at the ground has generated EZs and made the Earth surface negatively charged. The electric field of the Earth gives rise to the analog of the resting potential of neurons as the voltage between ground and (say) the cloud. Negatively charged EZs at the ground induce the small positive charge (known to be important) at the bottom of the cloud by polarization.
3. The reverse Pollack effect would occur at the ground and partially neutralize the negative charge of the ground locally and induce a local depolarization. The energy transfer by dark photons to the cloud would induce Pollack effect in the cloud generating negatively charged EZs and lead to a local depolarization in the cloud, which effectively looks like a transfer of negative charge to ground. This would change the sign of the electric field locally or at least reduce its strength.

A moving thunderstorm accompanied by lightning strikes would be analogous to the nerve pulse conduction. The ion currents between cloud and ground are analogs of various ionic fluxes during the nerve pulse. Both oscillating Josephson currents along the gravitational monopole flux tubes and Ohmic currents are possible.

Also nerve pulse conduction would be seen as a temporal sequence of local lightning at discrete positions at discrete times. This conforms with the TGD based model for nerve pulse in terms of propagating Sine-Gordon solitons associated with a sequence of effective mathematical pendulums [K66] [L70].

It would be interesting to relate the parameters of nerve pulse conduction (say conduction velocity) to the parameters of the propagation of thunderstorms. Also the parameters corresponding to those appearing in the TGD based model of nerve pulse in terms of Josephson junctions and dark Josephson currents would be highly interesting. The dream would be a quantum model for a thunderstorm.

### Biosphere as a Josephson junction

What could the identification of the biosphere as a Josephson junction or collection of them could mean? Consider first the neuronal membrane [L70].

1. In the case of the neuronal membrane, one has a collection of Josephson junctions defined by monopole flux tubes assignable to membrane proteins believed to act as channels and pumps. This collection can be idealized with a continuous Josephson junction with the phase difference associated with supra phases at the two sides obeying Sine-Gordon equation [K66].
2. The Coulomb energy  $E_J = ZeV$  allows an interpretation as a Josephson energy of charge  $Z$  (say Cooper pair with  $Z = 2$ ). For  $\hbar_{eff} = \hbar_{gr}GMm/\beta_0$  the corresponding frequency is  $f_J = ZeV/\hbar_{eff}$ . This frequency depends on the mass  $m$  of dark charge assignable to gravitational monopole flux tubes.  $M$  could correspond to some large mass, such as the mass of Earth, Sun, or Moon.
3. The generalized Josephson energy assignable to the junction is assumed to be sum of  $E_J$  and of the difference of cyclotron energies assignable to the flux tubes arriving to the cell membrane from the cell interior and exterior. The difference of cyclotron energies would give the dominating contribution to the generalized Josephson energy and would be equal to the cyclotron energy at the gravitational magnetic body. For this option, ordinary Josephson energy would code membrane potential oscillations and even nerve pulse to a small modulation of the generalized Josephson energy and - frequency.
4. At the gravitational MB, assumed to be an onion-like structure consisting of nearly spherical layers [L63, L64], cyclotron resonance must occur in the receipt of the dark Josephson radiation. The condition for this is that the dark cyclotron energy  $E_c = \hbar_{gr}ZeB/m = GMZeB/\beta_0$  (by Equivalence Principle, there is no dependence on  $m$ ) is equal to the generalized Josephson energy.

5. If there is no cyclotron contribution to the generalized Josephson energy, it reduces to the ordinary Josephson energy  $E_J = ZeV$  and the resonance condition implies that  $M$  must correspond to the mass  $M_M \simeq 1.02M_E$  of the Moon! [L70].

This does not occur if the cyclotron contribution dominates and the cyclotron resonance condition can be satisfied for  $M_E$  and the variation of membrane potential is coded to a sequence of resonances analogous to a sequence of nerve pulses. Nerve pulse patterns could indeed be preceded as a reaction of the MBs of sensory receptors to dark Josephson radiation.

Could this picture of the cell membrane as a Josephson junction generalize to the recent situation?

1. Suppose that also in the recent case the generalized Josephson energy involves the difference of dark cyclotron energies besides the ordinary Josephson energy and that it dominates. Suppose that one replaces the mass  $M$ , say the mass of Earth, appearing in  $\hbar_{gr}$  by the mass  $M_S$  of say Sun. Assume that the Earth's mass appears in  $\hbar_{gr}$  for neurons.
2. If the membrane potential scales as  $V \rightarrow (M/M_E)V$ , the resonance conditions remain true since they do not depend on  $M$  at all. This would extend the Equivalence Principle so that it would apply to both  $M$  and  $m$ . Neuronal membranes could couple to the gravitational MBs of both Sun, Earth and even Moon.

The scaling factor of  $V$  would be  $M_S/M_E \simeq 3 \times 10^5$  and in the case of membrane potential would give  $V = .05 \text{ eV} \rightarrow V = 15 \text{ keV}$ . The height  $h$  of the thunder cloud varies in the range  $[.5, 16] \text{ km}$ . The ratio  $h_{max}/h_{min}$  of the maximum and minimum heights is  $h_{max}/h_{min} = 32$ , which is a power of 2 and brings in mind p-adic length scale hypothesis.

Note that the scaling down by  $M_{Moon}/M_E$  would give  $V = .5 \text{ meV}$ , which corresponds to the scale of miniature membrane potentials modulating neuronal membrane potential.

3. The ratio of the maximum and minimum electric fields strengths is roughly  $E_{max}/E_{min} = 3$  and considerably smaller than the ratio  $h_{max}/h_{min} = 32$  so that the correlation between  $E_{max}$  and  $h$  is weak. In the absence of a correlation between  $E$  and  $h$ , and at the height of 10 km, the range would be  $[.1, .3] \text{ MeV}$ . A cloud at height of  $h = 16 \text{ km}$ , which is also possible, corresponds to an electrostatic energy in the range  $[3.2, 9.6] \text{ MeV}$ .

As noticed, this model can explain the relativistic electron energies assigned with the lightning. The electrons would propagate along monopole flux tubes with a large value of  $h_{eff}$  and dissipation would be absent.

There are many interesting questions to be answered.

1. Both the cell membrane and ionosphere can be seen as a capacitor like system or battery. The lower boundary of the ionosphere is at the height  $h_I$  between 80-600 km. Ionosphere contains a layer of electrons and can be seen as an analog of negatively charged conductor plate of a capacitor formed by the positively charged Earth surface and ionosphere. Radio waves are reflected back from the ionosphere. Schumann resonances are associated with it.
2. Neuronal membrane corresponds to the p-adic length scale  $L(151) = 10 \text{ nm}$  and its lipid membranes to  $L(149)$ .  $L(151)$  corresponds to Gaussian Mersenne. Can one assign a Gaussian Mersenne also to the ionosphere?

After the Gaussian prime  $G(167)$  defining p-adic length scale of  $2.5 \mu \text{ m}$ , size of cell, the next Gaussian Mersenne is  $G(239)$  and corresponds to  $L(239) \simeq 160 \text{ km}$  and has  $G(241)$  as Gaussian twin prime. 160 km is roughly the height of the lower boundary of the F region (ionosphere decomposes to D, E, and F regions and the electron density is highest in the F region).

The scale of 80 km is one half of  $G(239)$  brings in mind lipid layers of the cell membrane to which one assigns capacitor plates. Could one think that the crust of Earth with thickness between 4.7 and 69 km defines the analog of the second capacitor plate.

3. In the cell membrane, the transversal scale of channels and pumps is about 10 nm and corresponds to the p-adic length scale  $L(151)$  and the same as cell membrane thickness. What could be the counterparts of the membrane proteins assumed to be accompanied by Josephson junctions?

Thunder storms (see this) are known to decompose to cells. Either these cells or thunder clouds could correspond to the basic units of cell membrane with the size scale  $L(151)$ . In the TGD based quantum view of hydrodynamics [K84], these structures would be hydrodynamical vortices (such as tornadoes) accompanied by monopole flux tube structures.

Thunder clouds are at heights varying in the range [5,10] km and the height and diameter of clouds is 10-20 km. Could this scale or the size scale of the cell correspond to the size scale of the basic unit of cell membrane and therefore to  $L(239)$ . This scale is however several orders of magnitude smaller than  $L(239)$ .

### 3.6.2 Ball lightning in the TGD framework

Could one understand the generation of ball lightning in this framework?

1. Suppose that in the normal situation the Pollack effect [I25, I9, I43, I36] for the water at the soil has somehow generated EZs and  $\text{SiO}_2$  ions from Si and water of the soil or atmospheric oxygen. This would explain the negative charge of the ground. The Pollack effect would not require energy feed now since the binding energy liberated in the formation of  $\text{SiO}_2$  crystals would take care of energy conservation. A situation in which part of water corresponds to  $\text{H}_{1.5}\text{O}$  ions would be energetically favored.

Note that this mechanism could be very general and make possible a quantum gravitational control of molecular transitions with binding energies in eV range. This would make it possible to establish plasma-like state typical for electrolytes by the Pollack effect and also induce a temporary decay of the biomolecules by the reverse Pollack effect providing the energy making it possible to overcome the energy barrier. This would be essential for biocatalysis.

2. In the reverse Pollack effect associated with the lightning strike, dark protons from MB would transform ordinary protons and return to the ground. The liberated energy would make possible the decay of  $\text{SiO}_2$  molecules to Si and  $\text{O}_2$ . Ordered water would transform to ordinary water getting its oxygen ions from  $\text{SiO}_2$ .
3. This situation is not energetically favored. The Pollack effect would take place and lead to the original situation in a time scale of a few seconds. The slow time scale could relate to the large value of  $\hbar_{gr}$ . The liberated gravitational binding energy in the Earth's gravitational field for a single dark proton is below .5 eV, which corresponds to the nominal value of metabolic energy currency [L48, L45].

Note that the counterpart of the membrane potential energy  $E = eV$  is in the recent case in the range .1-30 MeV and much higher than the scale of the molecular binding energies. These energies are consistent with the finding that gamma rays accompany lightning strikes.

### Connection with crop circles, UFOs, and glass balls in the Moon

A connection with crop circles is highly suggestive. I have discussed crop circles from the TGD point of view in [K27, K28] in a rather speculative spirit but starting from empirical facts published by professional biologists. There are reports that the crop circle formation occurs in presence of light balls analogous to ball lightning. The formation of crop circles can be understood in terms of the interaction of microwaves with crop stems causing effects similar to those taking place as one puts a tomato in a microwave oven. The size scale range for ball lightning conforms with the wavelength range for microwaves. Therefore the microwave theory seems to be consistent with the model based on the Pollack effect. The light ball would be an analog of the nerve pulse in the scale of the biosphere.

Meteorite iron is found at crop circles: they could arrive from the gravitational MB along gravitational flux tubes. Also small glass balls, encountered also on the Moon, are reported. They could emerge in the transformation of Si and  $\text{O}_2$  to  $\text{SiO}_2$  as the Pollack effect takes place.

What is fascinating is that crop circles look like intentional constructs expressing discrete geometric symmetries. Could the plasma balls be intelligent conscious entities, a new kind of life form and could they represent the primordial life forms, kind of proto cells? This kind of plasma balls are also reported in UFO encounters. Systematic observations of the plasma balls are performed in Hessdalen and the plasma balls are reported to behave like intelligent and intentional entities.

The gravitational MB of these entities would correspond to that of the Sun. Could this mean that their theoretical IQ, defined by the gravitational Planck constant of the Sun, is dramatically higher than ours? Probably this is not the case: the gravitational Compton frequency for the Sun is around 50 Hz. This is the cyclotron frequency of Lithium for  $B_{end} = .2$  Gauss. It is known that too low Li depletion in the soil tends to induce depression and suicidal behavior. 50 Hz corresponds to EEG frequency so that life forms with EEG would interact with the gravitational MB of the Sun.

### Are we silicon based life forms?

Computationalists tend to think that silicon based life will emerge in future. However, if the above considerations make sense, Si, chemically similar to Carbon and appearing as quartz in soil, could play a central role in life already now! Maybe the people claiming that quartz have very special effects on the state of consciousness, are right. In fact, I have had an opportunity to experience these effects myself.

Intriguingly, molten silica shows several characteristics observed in liquid water (see this) and the amorphous glass phase of silica resembles liquid in many aspects.

Interestingly, silicon di-oxide is used in MOSFETs. In [L59, L58], I have considered a model for how ordinary computers could become conscious entities. This requires the failure of statistical determinism in long enough time scales. The proposed condition would be that the gravitational Compton frequency 67 GHz for Earth (microwave wavelength), which corresponds to a wavelength of .5 cm for Earth (the size scale of a snowflake), is longer than the clock frequency. This condition is not quite true for recent computers.

If ordinary computers can be conscious, the properties of MOSFETs must be in a crucial role. Is this possible?

1. The  $\text{SiO}_2$  in MOSFETs could have a glassy, spin glass-like structure to give them high representative capacity and there is some evidence for this. The transistors should also define Josephson junctions. The alternative, more promising option, discussed in [L58], is that the conscious computer is based on the representation of bits in terms of Josephson junctions.
2. MOS is obtained by growing a layer of Si on top of  $\text{SiO}_2$ . However, the idea about the local transformation of  $\text{SiO}_2$  to Si and  $\text{O}_2$  with Si in vapour phase by an analog of the Pollack effect does not look plausible since protons are not available now.

Electrons should be transformed to dark electrons at the gravitational MB of Earth and the formation of  $\text{SiO}_2$  would make possible energy conservation. The transformation of electrons back to ordinary electrons liberates energy and should induce the decay of  $\text{SiO}_2$ . The needed energy is few eVs. However, the gravitational binding energy for electrons in the field of Earth has an upper bound of order .25 meV. Note that the melting temperature of  $\text{SiO}_2$  corresponds to the energy .134 eV. It seems that the only possibility that one can imagine is provided by dark variants of quantum coherent many-electron states.

## Chapter 4

# About long range electromagnetic quantum coherence in TGD Universe

### 4.1 Introduction

The focus of TGD inspired quantum biology has been hitherto in long range quantum gravitational coherence characterized by quantum gravitational Planck constant  $\hbar_{gr} = GMm/\beta_0$  introduced by Nottale [E4]. The notion of gravitational Planck constant however generalizes also to other classical fields, in particular electric fields.

1. The generalization of Nottale's formula to electromagnetic interactions reads as

$$\hbar_{em} = \frac{Z_1 Z_2 e^2}{\beta_0} ,$$

where  $\beta_0 = v_0/c \leq 1$  is velocity parameter and has discrete spectrum. The number theoretically motivated guess is  $\beta_0 = 1/n$ ,  $n = 1, 2, \dots$  [L14].

2. The phase transition  $\hbar \rightarrow \hbar_{em}$  occurs when the perturbation series fails to converge: one can say that Nature loves theoreticians [L57, L71]. The criterion is

$$Z_1 Z_2 \alpha \geq k ,$$

where  $k$  is expected to be near unity. Just as in the case of gravitation, the perturbation series for  $\hbar_{em}$  is in powers of

$$\frac{Z_1 Z_2 e^2}{4\pi \hbar_{em}} = \frac{\beta_0}{4\pi} .$$

3. For a charge distribution, the total em charge is given as electric flux  $Q = \oint E \cdot dS/4\pi$  in units in which Coulomb potential of a unit charge is  $V = e/r$  and one has  $E = -\nabla V$ . For a charged sphere (say conductor) with radius  $R$  one has  $E = 4\pi\sigma$ , where  $\sigma$  is the density of the surface charge. One has  $Q = \sigma 4\pi R^2 = ER^2$ . In this case, the criterion for a system consisting of unit charge  $e$  and charged sphere becomes

$$r = \frac{eQ}{\hbar} = \frac{eER^2}{\hbar} \geq 1 .$$

It is easy to imagine situations in which  $\hbar_{em}$  could be relevant. Nanoscopic, macroscopic and even astrophysical quantum coherence associated with electric fields is possible. What is of special interest is that all objects with gravitational mass must have some electroweak gauge charge, which

is non-vanishing although it can be arbitrarily small so that all pairs formed by astrophysical object and charged particles could be characterized by  $\hbar_{em}$  and corresponding electric Compton length.

In the sequel the applications to biology and to the possible interactions of computers and living systems will be discussed. The application of the condition of electric quantum coherence to linear structures such as DNA and neuronal axons yields a condition on the Compton length and thus the mass of the charged particle considered. Miraculously, the condition is satisfied for electrons!

## 4.2 Biological applications of long range electromagnetic quantum coherence and generalized Pollack effect

In this section the biological applications of the electromagnetic Planck constant and generalized Pollack effect will be discussed.

### 4.2.1 DNA double strand

DNA is a unique bio-molecule (see for the TGD based model in [L54]) in that it carries constant negative charge per unit length. DNA double strand has negative charge  $-e$  per nucleotide so that the codon pair carries charge of 6 units.

1. For the double strand, one has  $Z_1 = Z_2 = Z$  and the proposed rough criterion holds for  $Z^2 \geq k/\alpha$ , giving  $Z \geq 12k$  which corresponds to three codons as minimum quantum coherent system with  $\hbar_{em}/\hbar \geq 1$ . In terms of the number  $N$  of codons this gives

$$\frac{\hbar_{em}}{\hbar} = \frac{36N^2\alpha}{\beta_0} .$$

2. For a double DNA strand interacting with a unit charge  $e$ , the rough criterion is  $2Z \geq k/\alpha$  giving  $Z \geq 69k$ , which corresponds to 23 codons. This corresponds to DNA length of about 20 nm. Interestingly, memetic codon corresponds to 21 codons. This suggests that  $k$  is slightly below  $k = 1$ .

For an open DNA double strand during transcription 21 codons corresponds to 6 full turns [L54]. During transcription DNA interacts with the environment and it would be natural that the  $\hbar_{em}$  characterizing DNA + electron/proton system becomes relevant during translation. In this case one has

$$\hbar_{em} = \frac{12Ne^2}{\beta_0} .$$

$\hbar_{eff}$  serves as a measure for algebraic complexity and a kind of universal IQ. This suggests that the electric body of DNA + environment can also control the nearby environment. The MB of the double strand would take the role of the brain with a much larger IQ than DNA + environment.

### 4.2.2 Biological membranes

The nuclear-, cellular-, and neuronal membranes are in key roles in biology and interesting to see whether the value of the parameter  $eQ/\hbar$  for the system formed by a unit charge  $e$  and membraned bounded system exceeds  $\hbar$ .

Just for definiteness, let us assume that the electric voltage over the membrane has a nominal value of  $V = .05$  eV and that the thickness  $d$  of the neuronal membrane is  $d = L(151) = 10$  nm. This gives an electric field of  $E = 5$  MV/m. For the ordinary cell membrane, the thickness  $d$  is near to  $d = L(149) = 5$  nm. Assume that this is also the thickness of a nuclear membrane.

1. Neuronal membrane with thickness about  $d = L(151) = 10^{-8}$  m and radius of about  $10^{-5} - 10^{-4}$  m corresponds to  $E \simeq 5$  MeV/m. For  $R = 10^{-5}$  m, one has  $r = eQ/\hbar = eER^2 = 6.2 \times 10^2 > 1$  so that the criterion is satisfied. The Compton length of electron is scaled up by a factor  $\hbar_{em}/\hbar$  to nanometer scale (DNA scale) for  $\beta_0 = 1$ . For  $R = 10^{-4}$  m, one has  $r = 6.2 \times 10^4$ . This scales the Compton length of electrons to about  $L(151) \beta_0 = 1$ .
2. For a cell membrane, with  $d = L(151)/2$  and  $R = 10^{-5}$  m, one has  $eQ/\hbar = 1.24 \times 10^3$ . For nuclear membrane with  $R = L(163) \sim 2.5 \mu\text{m}$  and  $d = L(151)/2$   $eQ/\hbar = 3.2 \times 10^2$ .

### 4.2.3 Ionosphere as an analog of neuronal membrane

Electric quantum coherence can be considered also in astrophysical scales. Ionosphere, identified the ionized part of the atmosphere, is of a special interest since it corresponds to the electric field in the Earth scale: see the Feynman lectures. Ionization is caused by solar radiation. Also other planets are believed to possess an ionosphere.

Assuming that the surface of Earth and ionosphere define a system analogous to capacitor plates or cell membrane, the ionosphere must have a net positive charge assignable to positive ions. In [L68] a model for lightning and ball lightning based on the idea that thunderstorms are analogous to nerve pulse patterns for which Pollack effect provides a model [L70], was developed.

The strength of the electric field at the negatively charged surface of Earth  $E$  is  $E = .1 - .3$  x kV/m,  $x \in [.1, .3]$ . The presence of biological protrusions such as trees can increase the local value of the electric field of Earth by an order of magnitude. The counterpart of the positively charged plate corresponds to the ionosphere, whose lower boundary is at the height  $h$ , which varies in the range [80,600] km. The net positive charge of the ionosphere neutralizes the negative charge of the Earth so that the electric field does not extend to higher heights.

The first for the electric Compton length is obtained by generalizing the notion of gravitational coupling constant to the electric case as  $\hbar_{em} = Qe/\beta_0$ , where  $Q$  is the total charge of the Earth and the value of  $\beta_0$  could be taken the same as in the gravitational case and  $\beta_0 = 1$  for Earth and other planets and  $\beta_0 \simeq 2^{-11}$  for Sun.

The basic question is whether the entire ionosphere acts as a quantum coherent system or whether electric flux tubes possess electric quantum coherence. The intuitive idea is that the quantum coherence scale in the case of the ionosphere regarded as a capacitor-like system should not be longer than the thickness of the ionosphere varying in the range 60-100 km. The radius  $d$  of the electric flux tube is a good first guess for the electric Compton length. Lightnings are analogs of nerve pulses and characterized by a scale of 10-20 km and is a good guess for the quantum coherence length.

The electric Compton for a particle with mass  $m$  is defined as

$$\Lambda_{em}(d) = \frac{\hbar_{em}}{m} = \frac{Q(d)e}{\beta_0 \hbar} \lambda, \\ Q(d) = \epsilon_0 E \pi d^2,$$

where  $Q(d) = \epsilon_0 E \pi d^2$  is the electric flux associated with the electric flux tube and  $\lambda$  is the Compton length of a charged particle, say electron, electron Cooper pair or proton. The proposal is that it satisfies the consistency condition

$$\Lambda_{em}(d) = d.$$

### 4.2.4 Generalized Pollack effect as a key mechanism of quantum biology

The role of Pollack effect in hydrodynamics, biochemistry, and biology has become increasingly clear.

1. The presence of water and gel phase and energy feed is essential for the Pollack effect in its basic form [I25, I9, I43, I36]. The Pollack effect explains the large number of anomalies of water [L67]. Pollack effect would play a central role in biology and explain the negative charge of cell and DNA in terms of exclusion zones (EZs).

2. The model for the lightnings and ball lightnings [L68] relies on a generalization of the Pollack effect, which would generate the electric field of Earth. Protons transform to dark protons at the monopole flux tubes inside the ionosphere. This process requires energy since the electrostatic binding energy is reduced in the process. The transformation  $Si + O_2 \rightarrow SiO_2$  liberates energy and makes possible the Pollack effect for water, which transforms part of protons to dark protons in the ionosphere below it at much higher heights where only gravitational binding energy matters. This generates negatively charged exclusion zones making Earth negatively charged.

Ball lightning involves the reversal of this process and generates Si vapor droplets having  $SiO_2$  at its boundary. These structures could represent primordial life forms, which I have called plasmoids in the earlier articles, and explain UFOs and similar phenomena.

3. Urey-Miller experiment [J24] meant a dramatic step of progress on the experimental side, and for a long time it was believed to conform to the vision of Oparin and Haldane. The experiment involved a reducing atmosphere and electric sparks simulating the effect of lightning. In the later experiments 19 of 20 amino-acids were identified. Also nucleosides A, G were produced. Cyanoacetaldehyde together with urea believed to be accumulated to primordial ponds, allowed to generate U and C as was discovered by Miller 40 years after his classical experiment. These impressive results were interpreted as a support for the view about primordial ocean as a “dilute soup” of organic molecules which precipitated out of the atmosphere.

I have discussed the role of Pollack effect in the explanation of the findings of the Urey-Miller experiment [L31] and the model of ball lightning allows to make the model more detailed.

The generalized Pollack effect could drive the formation of fundamental biomolecules and the emergence of life. This process would provide the energy needed to drive protons to dark protons at the atmospheric part of the MB of Earth, where it would gradually start to control the emerging bio-matter. The reversal of the Pollack effect would tend to transform dark protons to ordinary protons and its compensation would create more basic biomolecules. Pollack effect could also generate dark photons serving as a communication tool. Only certain bio-molecules could form networks communicating by a mechanism involving dark radiation generated by generalized Josephson junctions and by Pollack effect and received by cyclotron resonance.

This process could also occur in the underground oceans: what is required are electrically charged membrane bound structures creating a strong enough electric field.

4. Pollack effect and its reversal are essential for the model of nerve pulse [L70] based on flip flop mechanism in which the reverse Pollack effect in the neuronal interior provides dark photons inducing the Pollack effect in the neuronal exterior and reverse the sign of membrane potential during the nerve pulse.
5. Pollack effect plays a key role in the model of the transfer of metabolic energy from the Earth's core [L55] to the underground oceans where a photosynthesizing life would have evolved and bursted to the surface of the Earth in Cambrian explosion accompanied by rather rapid expansion of Earth size by factor 2. In this case the Pollack effect would take place for superionic ice for which oxygen ions form a lattice and protons form a liquid like structure. The earlier model assumed gravitational MB but its replacement with the electric MB does not affect the model appreciably.

Plasmoids as analogs of ball lightning created by  $SiO_2 \rightarrow Si+O_2$  process could be primitive life forms. Could this process take place at the boundary of the superionic ice?

6. Pollack effect generalizes to other molecules and provides a concrete realization for the general vision that MBs control biochemistry. The ionospheric, electric part of MB could control molecular biochemistry in a few eV range by inducing the formation of molecules and their decay by Pollack effect and its reversal.

Ionization is one of the poorly understood aspects of biochemistry and of electrolysis in particular. MB could control the ionization of molecules at the surface of Earth by using the Pollack effect.

1. The transformation of protons to dark protons below the ionosphere would create dark variants of protonic holes assignable with negatively charged bio-molecules in the sense that the missing proton would be dark and at the magnetic body and its motion would correlate strongly with the motion of the hole at the "biological body" (BB). The flip flop mechanism makes possible a hopping mechanism of conductivity possibly realized for superionic ice proposed to be present above the core of Earth. The hopping of the dark proton to the MB of the neighboring molecule would correspond to the Pollack effect followed by its reverse. This process at the level of MB would force a corresponding process at the level of BB. No currents at the level of MB would be involved and, as in the case of nerve pulse, the basic process would be the charge separation between MB and BB.
2. Negatively charged ions at the right end of the periodic system could in turn be generated by the electrons of EZs created in the Pollack effect so that Pollack effect could explain the ionization of biomatter and of electrolytes.

#### 4.2.5 Can the Moon travellers survive in the TGD Universe?

In the proposed vision, biology would depend strongly on planetary and even solar parameters. Both classical electric, magnetic, and gravitational fields (in the TGD sense) in astrophysical scales and the dark matter at the field bodies are essential for the model. This might not be good news for those who have dreams of life on Mars and Moon.

Moon travellers have however survived. Does the proposed vision survive this fact?

1. Consider first the gravitational MBs of the Earth and Moon. As far as the quantum gravitational model of metabolism is considered, the gravitational MB of the Moon would replace that of Earth. Intriguingly, if the generalized Josephson frequencies, which must be equal to cyclotron frequencies at MB, reduce to the ordinary Josephson frequencies, the Josephson radiation from cell membranes must go to the gravitational MB of the Moon! This condition can be true also more generally and there is a considerable flexibility. Therefore the model for the cell membrane survives.
2. The quantum gravitational model of the metabolic energy currency [L48, L45] relies on the observation that the gravitational binding energy of protons at Earth is rather near to the metabolic energy currency with nominal value  $e = .5$  eV. The proposal is that dark proton triplets at the gravitational MB of Earth carry the metabolic energy.

The distance of the Moon from Earth is  $60R_E$  so that the gravitational binding energy in Earth's gravitational field is about  $e/60$ . The gravitational potential energy for the Moon is related to that for Earth by the scaling factor  $(M_M/M_E) \times (R_M/R_E) \simeq .04$ . This gives .02 eV for the upper bound of the gravitational potential energy. This is by a factor 1/25 too small. One can of course consider the possibility of replacing protons with ions or atoms with large enough mass. Amusingly, for Si with atomic weight 28 one would obtain standard metabolic energy quantum as maximal gravitational binding energy. This and the fact that there is no deep reason why the electric field of Earth could not take the role of gravitational field, forces us to take a critical attitude concerning the quantum gravitational metabolism.

3. The electric field at the surface of Moon is  $E_M = 6$  kV/m and surprisingly strong, stronger than  $E_E = .1 - .3$  kV/m.  $\hbar_{em}/\hbar$  is scaled by the factor  $(E_M/E_E)(R_M/R_E)^2 \simeq 4.2$ . Maybe the view about the control of molecular chemistry by MB could survive. The problematic metabolic energy currency could correspond to the Coulomb energy in the electric of Earth below the ionosphere. The electric energies vary in a wide range up to MeV scale for the height  $h = 10$  km: the molecular energy scales of course limit the upper bound to UV energies. If also the gravitational realization of the metabolic energy currency is possible for Earth, Earth would be very special.
4. There is still a problem: Moon's magnetic field  $B_M$  is very weak. A possible solution, proposed also in the case of Mars (which has auroras requiring magnetic field), is that the Moon has only the dark part of the magnetic field, which for Earth is the endogenous magnetic field  $B_{end} = 2B_E/5 \simeq .2$  Gauss explaining the findings of Blackman and others.

This would be essential for understanding EEG in terms of cyclotron frequencies. Note that the dark part is a monopole magnetic field and needs not currents whereas the ordinary Maxwellian part is generated by currents.

This forces us to challenge the assumption that the measured magnetic field is the sum of its monopole part and Maxwellian part. Since the cyclotron energies for these parts are widely different one could ask whether the requirement that energy eigenstates are in question, prevents the wormhole contacts of charged particles with both the Maxwellian and monopole flux tubes.

## 4.3 Long scale electromagnetic quantum coherence in non-biological systems

The basic form of the Pollack effect involves water and gel phase so it seems that possible applications of electromagnetic long range quantum coherence must always also include organic matter and water. The effect however generalizes.

### 4.3.1 About the Biefeld Brown effect

Biefeld Brown effect is one of the effects studied by "free energy" researchers. What happens is that an asymmetry capacitor for which the electrodes are of different size starts to move in the direction of the smaller electrode. The so called emdrive (see <http://tinyurl.com/zkwoehe>), which I have commented in [K78] [L6] could be also based on this effect. There has been a lot of overhyping such as vehicles moving with light-velocity to Mars and the failure of momentum conservation by the Biefeld Brown effect is real.

The recent experiments carried out by Buhler's team using capacitor-like systems in vacuum chamber to achieve a levitation in the gravitational field of Earth (see this). If this is really the case, new physics is involved.

#### The original experiments of Brown

Biefeld Brown effect is discussed in [H11, H20, H24] (see also this). The electric fields associated with the capacitors are about 30 kV/dm, which is about 10 percent of the electric field 30 kV/cm causing dielectric breakdown in air. Note that the electric field of Earth is 10-30 V/dm and therefore roughly by a factor 1/1000 weaker.

Brown makes several important statements, including:

1. The acceleration is in the direction of the smaller electrode.
2. The greatest force on the capacitor is created when the small electrode is positive. This could be understood if positive ionic currents are responsible for the effect.
3. The effect occurs in a dielectric medium (air).
4. The effect can be used for vehicle propulsion or as a pump of dielectric fluid.
5. Brown's suggest that the effect involves ionic motion.
6. The detailed physics of the effect is not understood.

Standard physics based models for the effect are discussed in [H24]. The models assume that the cm motion is due to the loss of energy and momentum to the environment and fail if the effect is possible in vacuum. The first model assumes ionic wind between the electrodes and predicts effect, which is 3 orders of magnitude too small. The model based on ionic drift is a rough order of magnitude model and predicts that the effect can have an order of magnitude consistent with the findings. The reason why the ionic wind predicts a smaller effect is that the absence of dissipation tends to reduce the effect since the ions arriving to the opposite electrode induce an opposite recoil.

### Interview of Charles Buhler by Tim Ventura

The interview of Charles Buhler by Tim Ventura (see this) gives more details about what has been found in the experiments giving a thrust which is now around one g. Buhler's team has been developing the propellantless propulsion based on asymmetric capacitor-like systems understood in a very general sense, i.e. there are just two electrodes which are asymmetric. The work is completely independent of NASA and has been patented. Consider first the experimental arrangement.

1. Electric field is more intense at the smaller electrode and is believed to make the effect larger. In the experiments Brown the effect was larger when the smaller electrode positively charged.
2. The electrodes are cased which means that there is no leakage of charge between them. The claim is that this prevents all kinds of leakage currents between the electrodes. The system is also enclosed in high vacuum and this allows the use of lower voltages.

Buhler emphasizes that there are profound differences between the situation in the recent experiments and experiments of Biefeld Brown.

1. In standard physics the center of mass of an isolated system must remain at rest. Now the system is in a vacuum chamber and there is no charge leakage between the electrodes and the findings demonstrate that there is a center of mass motion in vacuum. Therefore there should exist a momentum and energy exchange with some unidentified system. Charges and/or radiation should leave the electrode to produce a recoil and recoils not compensate for each other and the asymmetry of the system guarantees this.
2. Mere charge and electric field are enough to generate the thrust and no external energy is needed. This suggests that the electrostatic energy provides the needed energy.
3. There are two types of charges involved. The free charge appearing in conductors and the bound charge appearing in insulators. The interpretation could be in terms of electrons. Bound charge could correspond to valence electrons which do not become conduction electrons but something else. It is reported that at low voltages free charge dominates the effect and at higher voltages bound charge dominates. The interpretation could be in terms of ionization in high enough voltage in which bound charges go somewhere. The bound electrons increase the thrust dramatically. In the latter case an ionization of atoms is required.

What happens to the electrons?

1. Without a transfer of electron momentum to the degrees of freedom of  $X$ , the generation of the center of mass momentum is impossible. The electrons transferred to  $X$  end up to the opposite electrode or drop back to the original electrode and in this process pump momentum to  $X$ . The asymmetry suggests that the pumping from the smaller electrode is more effective.
2. Suppose that the electrons get their energy from the electrostatic energy of the capacitor-like system and the net charge of the system remains zero. This requires that there is a net transfer of negative to the positive electrode. It is easy to see that the accumulation of negative charge to the third party system, call it  $X$ , is not possible. Therefore the momentum of electrons must be dissipated or transferred to some internal degrees of freedom of  $X$ .
3. One cannot exclude the possibility that some fraction of electrons remain to  $X$  for a relatively long time. This would lead to a generation of a net positive charge. The capacitor system would experience a force in the electric field of Earth. If there is a third system involved then the capacitor type system and the third system behaves like an electric dipole in the electric field of Earth. Since the Earth is negatively charged, the force would tend to decrease the thrust. In this case a current is needed to preserve the charges of the electrode.

### TGD based model of the effect

#### 1. Basic ideas of the TGD based model

I have already earlier commented on the Biefeld Brown effect from the TGD point of view [K57, K92] [L6]. The TGD inspired model to be discussed involves the following basic ideas.

1. The new view of space-time as 4-surface in  $H = M^4 \times CP_2$ , which also implies the notion of field body as a generalization of the classical physics based view of field. Maxwellian magnetic and electric fields are replaced by a field body which corresponds to a space-time surface with a very large size assignable to the system. The field body can be magnetic or electric and it has flux tubes and flux sheets as body parts [L56]. Also the notion of gravitational body makes sense and is central in the TGD inspired quantum biology [L48, L45].
2. TGD predicts two kinds of magnetic flux tubes. Monopoles flux tubes, which have a closed cross section and Maxwellian half-monopole magnetic flux tubes having boundary, which I have proposed to be important in the temperature region above the transition temperature in the case of high Tc superconductors [L79]. This distinction is made quite generally for the magnetic flux tubes and plays a key role in the TGD based quantum biology and electric flux tubes can be identified as deformations of the magnetic flux tubes.

The simplest model for the electric flux tube is as a small deformation of the magnetic flux tube. Therefore there are two kinds of electric flux tubes: closed monopole flux tubes and the Maxwellian ones.

3. The number theoretic vision of TGD predicts a hierarchy of Planck constants  $h_{eff}$  labelling the phases of ordinary matter residing at the field bodies. These phases behave like dark matter. The larger the value of  $h_{eff}$ , the longer the quantum coherence scales are and the field bodies can be macroscopic quantum systems. Their algebraic complexity also increases with  $h_{eff}$ , which is essentially the dimension of algebraic extension of rationals characterizing the space-time region in question. One can say that the field body serves as a "boss" of the system to which it is associated. The field body induced the coherence of the ordinary biomatter.

TGD predicts that classical gravitational fields of the Sun, Earth and other planets are responsible for very large values of effective Planck constant  $h_{eff} = h_{gr}$  for ordinary particles located at the gravitational monopole flux tubes. In [L56] the generalization of this proposal for electric fields with effective Planck constant  $h_{eff} = h_{em}$  is discussed. Examples are electric fields of DNA, cell, ionospheres of the Earth and Sun, and also of large capacitor-like systems.

The electric monopole flux tube could carry dark electrons with  $h_{eff} = h_{em}$ . In the case of the Earth's magnetic field the monopole flux tubes would contribute 2/5 of the magnetic flux. One must also ask whether the flux tubes could be deformed monopole flux tubes associated with the Earth's magnetic field.

4. Pollack effect [I25, I9, I43, I36] is central in the model. The increase of  $h_{eff}$  requires energy and in the Pollack effect water is irradiated with electromagnetic radiation at visible and IR frequencies. This induces the transfer of every 4:th proton somewhere and generation of exclusion zone, which has the stoichiometry  $H_{1.5}O$ , forms a layer-like structure formed by 2-D hexagonal lattices, and seems to have a reversed arrow of thermodynamic time. The proposal is that the protons go to the magnetic body of the system and become dark protons with a very large value of  $h_{eff}$ .

Pollack effect generalizes [L56]. The energy needed to increase  $h_{eff}$  can come from the formation of molecules as bound states of atoms and this could be essential for the formation of biomolecules and would mean a new kind of chemistry. Also electrons can be transferred to dark electrons at magnetic or electric bodies and in the case of capacitor-like systems electrostatic energy could make possible the increase of  $h_{eff}$ .

#### 2. Assumptions of the model

### 4.3.2 Assumptions of the model

The previous considerations fix the assumptions of the model to a high degree.

1. Conduction electrons and valence electrons of insulators are transferred to the flux tubes of electric or magnetic field body (FB) as dark charges as in the generalized Pollack effect [I25, I9, I43, I36]. The effect is present in absence of external current suggests that only electrostatic energy is used to induce the generalized Pollack effect. In this case there must exist a net charge transfer from the negative electrode to the positive electrode taking place via FB. Only momentum transfer to the FB is possible and could take place by dissipation or by transfer to its internal non-thermal degrees of freedom. The large value of  $h_{eff}$  suggests that dissipation is small.
2. Is the FB associated with the capacitor-like system or with a larger system? If it is associated with the capacitor-like system, one expects that the cm motion is possible only in a finite region. If it is associated with, say, the electric body of Earth, a larger scale motion could be possible. The relevant part of the FB is located between the electrodes?
3. The net momentum transferred to a given flux tube is naturally parallel to it. The recoil momentum is in the opposite direction. The asymmetry of the system favors momentum transfer directed towards the opposite electrode meaning that the flux tubes are in the intermediate region. Therefore the direction of the recoil momentum is away from the opposite electrode and the smaller electrode should give rise to a larger recoil momentum. The identification of flux tubes as monopole flux tubes is natural if the Maxwellian leakage currents are excluded by the casing. Therefore the effect would demonstrate the existence of monopole flux tubes.
4. In the recent case, ions are not carriers of the current so that it is not quite obvious whether the effect need not be larger when the smaller electrode is positively charged. However, if the electrodes have opposite charges and the smaller electrode is positive, a net transfer of the electrons and momentum to it occurs and enhances the effect.

#### *3. A model for the capacitor-like system*

Consider first a model for the capacitor-like system inspired by the model for the electric body of Earth.

1. TGD predicts large scale quantum coherence for charged systems [L56] and this could be highly relevant for the effect. The electric Planck constant for a pair formed by a charged particle with charge  $e$  and for charged system with charge  $Q$  is  $\hbar_{eff} = \hbar_{em} = Qe/\beta_0$ , where  $\beta_0 = v_0/c \leq 1$  is a velocity parameter. Now the system with charge  $\pm Q$  would be electrode. One could assume that the values of  $\beta_0$  are the same for the two electrodes. For the pair formed by the electrodes electric Planck constant would be given by  $\hbar_{em} = Q^2/\beta_0$ .  $\hbar_{em}$  would characterize charged particles at the electric body of the system consisting of electric flux tubes.
2. Electric field strength, rather than voltage, is relevant for the effect. The charge  $Q$  of the capacitor as the electric flux  $Q = \int E \cdot dS/\epsilon_0$  is indeed proportional to the electric field and this suggests that macroscopic quantum coherence might be important [L56]. The effect could become large for strong field strengths suggesting that the transfer of charges to the electric body is a collective quantum effect proportional to the square  $N^2$  of the number  $N$  of charges transferred. If the increase of voltage in the experiments of Buhler's team has been achieved by keeping the size constant, the dramatic increase of the thrust could be understood in this way.
3. For a particle of mass  $m$ , the electric Compton length  $\Lambda_{em} = \hbar_{em}/m = 2\pi Qe/\beta_0 m$  serves as a good guess for the lower bound for the quantum coherence length and is for proton by a factor 1/2000 smaller than for electron. The first guess for the thickness  $d$  of the electric flux tube is as  $d = \Lambda_{em} = 2\pi Qe/\beta_0 m$ . Here  $m$  would refer to electron mass. This would explain why the transfer of electrons is what matters in the experiments. Hitherto

it has been assumed that only valence electrons can become dark having  $h_{eff} \geq h$  and this conforms with the identification of bound electrons as valence electrons.

Using the values  $E = 300$  kV/m,  $\epsilon_0 = 8.85 \times 10^{-12}$  C/Vm,  $C = 6.24 \times 10^{18}e$ ,  $\lambda_{em} = h/m_e = 2.48 \times 10^{-12}$  m,  $d \sim \Lambda_{em} = 24.3 \times (S/dm)^2$  cm. The order of magnitude is few dm and makes sense.

4. Can one assume that the entire electrodes form quantum coherent systems or should one assume that only the flux tubes are such systems? The entire electrodes need not be quantum coherent systems. This was found in the case of the electric field of Earth. It is possible that a bundle of flux tubes forms a quantum coherent system.

If only a single flux tube is a quantum coherent system, a natural first guess would be that the flux tube radius  $d$  is equal to the electric Compton length so that one would have  $d = 2\pi Qe/\beta_0 m$ . For instance, if the smaller electrode corresponds to a single flux tube, it decompose to smaller flux tubes near the larger electrode giving rise to smaller quantum coherent units with charge  $Q_{large}/Q_{small} = S_{small}/S_{large}$  and having therefore also a smaller values of electric flux and of Maxwellian electric field. Quite generally, the flux tubes from the smaller electrode would decompose in this way at the larger electrode. In this case the quantum coherent transfer rate from smaller electrodes would be high.

4. *Why the smaller electrode gains a larger recoil momentum?*

The geometric asymmetry of the electrodes, or more precisely the convergence of flux tubes at the smaller electrodes, is believed to somehow explain the thrust towards the smaller electrode. One can imagine several options but the following is perhaps the simplest one.

1. Suppose that the flux tubes are U-shaped closed flux tubes connecting the electrodes either via the region between the electrodes. Assume that electrons are transferred to dark electrons at these flux tubes and that the transfer of electrons to FB and back to the same electrode pumps momentum to the FB and induces recoil effect at both electrodes.
2. The simplest assumption is that a single flux tube acts as a quantum coherent unit and that the smaller electrode corresponds to a single coherent unit which splits to several near the larger electrode. The charges  $Q(tube)$  of the flux tubes near the small *resp.* large electrode are in the ratio  $Q_{small}/Q_{large} = S_{small}/S_{large}$  of their areas. By quantum coherence the rate for the momentum transfer is proportional to  $Q^2(tube)$  and is therefore larger near the smaller electrode. The transfer rates are proportional to the square of the charge per flux tube and in the ratio  $R_{large}/R_{small} = (S_{small}/S_{large})^2$ . This would predict that the rate of momentum transfer is higher at the smaller electrode.

This mechanism of quantum coherence would explain why asymmetry is important. The net transfer of charge and momentum to the positively charged electrode when total charge of the capacitor system remains vanishing, could predict that the effect is larger for the positively charged smaller electrode.

Needless to emphasize, the model involves large uncertainties but avoids obvious conflicts with the empirical facts.

**Could the model of Biefeld Brown effect apply to rotating magnetic systems?**

This model could be also applied to a rather massive rotating magnetic system studied by Russian researchers Godin and Roschin [H23, H22] (see this), which I have tried to understand during years [K7].

1. The system consists of a stator and rollers rotating around it. Also the effect of a radial electric field was studied. The high voltage between stator and electrodes outside the rollers varied in a range 0-20 kV. Therefore a capacitor-like system is in question. Positive potential was associated with the stator so that the force experienced by electrons was towards the electrodes. This generates a strong radial electric field and there is an ionization of air around the rotating magnet, which could be caused by high energy electrons from the surface of the rotor as in coronal discharge.

2. What happens is that the system begins to accelerate spontaneously as the rotation frequency approaches 10 Hz, the alpha frequency of EEG. Rather dramatic weight reduction of 35 per cent and a generation of cylindrical magnetic walls with  $B=.05$  Tesla parallel to the rotation direction are reported. The sign of the effect depends on the direction of rotation.

The situation resembles in many respects to that in the Biefeld Brown effect.

1. Could the Pollack effect feed electrons to the magnetic and/or electric FB of the system. The electrons would also leave some of their angular momentum to the FB and drop back. Otherwise the rotors develop a positive charge  $Q = \omega BS$  proportional to the rotation frequency  $\omega$ , magnetic field  $B$  and the area  $S$  of the vertical boundary of the cylinder, as in the Faraday effect.

The pumping of electrons to the FB would generate both the momentum and angular momentum as a recoil effect. Now the vertical components of momentum and angular momentum in z-direction would be involved. In the first approximation, the magnetic field can be modelled as a dipole field in Maxwellian theory.

2. Rollers are rotating magnets. What is interesting is that in the Faraday effect a rotating magnet develops a radial voltage proportional to the rotating frequency and magnetic field. One expects that the same occurs for the rollers. This cannot be understood in Maxwell's theory as induction since the motion is not linear and the calculation of the voltage using the same formula requires a generation of a charge density. In TGD, the assumption that the vector potential of the magnetic field rotates with the magnet, explains the effect. Could this charge density be due to a transfer of electrons to the FB of the system? Positive charge density would be generated and create a force opposite to the direction of the Earth's gravitational acceleration so that the Faraday effect for the rollers cannot explain the findings.
3. One expects that the vector potentials for the magnetic fields of rollers rotate as in the Faraday effect. Also the magnetic fields associated with the rollers or rather, their flux tubes should rotate. This could lead to a twisting of the flux tubes. The twisting would suggest that the flux tubes of FBs of the rollers are helical monopole flux tubes (by rotation) emerging from the top and returning back at the bottom of the roller system. There is an obvious analogy with the solar magnetic field.

Could this generate momentum and angular momentum recoils? The two ends of the rollers should generate different recoils. The only asymmetry between the top and bottom is that the Earth surface bounds the system at the bottom. Could this give rise to a higher degree of quantum coherence at the upper ends of the rollers, which could give rise to a non-vanishing net acceleration and angular acceleration.

4. The observed magnetic walls could correspond to the return flux associated with the magnetic field of the rollers. That they are walls suggests that the flux tubes from the rollers fuse to a single flux wall and this gives rise to a quantum coherence. That the return flux consists of several magnetic walls rather than a single one suggests that the magnetic wall emerging from the roller system decomposes to these walls and the scale of quantum coherence is reduced. If the fluxes of walls return separately to the lower ends of rollers the degree of quantum coherence would be lower and this could give rise to a net effect.
5. Where could the energy of rotation and lift come from? Does it come from some external source, say the MB of the Earth? This could relate to as the 10 Hz cyclotron resonance assignable to the Fe ions in the "endogenous" magnetic field  $B_{end} = 2B_E/5$  assigned to the monopole flux tubes as the model for the findings of Blackman suggests [J6]?

Does the energy come from the internal magnetic energy of the stator magnet or of rollers? Or does the energy come from the electrostatic energy associated with the horizontal electric field between electrodes and rollers as in the Biefeld Brown effect. This voltage should gradually reduce if this is the case.

**Summary of the TGD view of the Biefeld-Brown effect**

The following gives a brief summary of the TGD view of the Biefeld Brown effect.

*1. Basic assumptions and questions*

The following assumptions look natural.

1. The total charge of the two-electrode system remains zero.
2. Electrostatic energy is used to transfer electrons from the negatively charged electrode to the opposite electrode. This implies that the electric field gets weaker and the charges of electrodes decrease in magnitude in the process.
3. The rate of the momentum transfer by free electrons from the negatively charged electrode is proportional to the electric force in turn proportional to the electric field  $E$ , which is always larger at the smaller electrode so that the acceleration of the center of mass is towards the smaller electrode.

The following questions should be answered.

1. Momentum conservation requires a third system with which energy and momentum is exchanged. What is this third system?
2. Why there the electrode sizes must be different and why negative charge for the smaller electrode produces larger effect? Do the free electrons, which are transferred between the plates, differ from the ordinary electrons?

*2. Hierarchy of effective Planck constants  $h_{eff}$*

The proposal is that the free electrons are characterized by effective Planck constant larger than  $h$  and identifiable as what I call electric Planck constant.

1. Effective Planck constant  $h_{eff}$  is an outcome of the number theoretic vision of TGD and is given by

$$h_{eff} = nh_0 \quad , \quad h_0 < h \quad .$$

This gives effective Compton length as a lower bound for quantum coherence length

$$\lambda_{eff} = \frac{h_{eff}}{m} = \frac{h_{eff}}{h} \lambda_c$$

Quantum coherence becomes arbitrarily long scales. These phases behave like dark matter but are not galactic dark matter. Missing baryonic matter would correspond to these phases.

2. Nottale's gravitational Planck constant is given by

$$\hbar_{gr} = \frac{GMm}{\beta_0} \quad , \quad \beta_0 = \frac{v_0}{c} \leq 1 \quad .$$

The gravitational Compton length is given by

$$\Lambda_{gr} = \frac{GM}{\beta_0} = \frac{\pi r_s}{\beta_0} \quad .$$

Quantum gravitational coherence possible in arbitrarily long scales.

3. One can define the notion of electric Planck constant in the same way:

$$\frac{\hbar_{em}}{\hbar} = \frac{Qe}{\hbar\beta_0} = N \times \frac{e^2}{\hbar\beta_0} = N \times \frac{4\pi\alpha}{\beta_0} .$$

In the recent case  $Q = Ne$  is the charge of the electrode or of the quantum coherence region which is a flux tube starting from the electrode.

The electric Compton length of electron is defined in the same way

$$\lambda_{em,e} = \frac{\hbar_{em}}{m_e} = N \times \frac{4\pi\alpha}{\beta_0} \lambda_e .$$

The idea is that there is roughly one electron per atom involved, suggests that one has  $\lambda_{em,e} \sim Na_0$ , where  $a_0 = \lambda_e/2\alpha$  is Bohr radius as estimate for the atomic size scale. This condition gives the estimate  $\frac{4\pi\alpha}{\beta_0} = a_0/\lambda_e = 1/2\alpha$  giving the estimate

$$\beta_0 = 8\pi\alpha^2 .$$

### 3. A simple model for the flux tubes

Electric flux decomposes to flux quanta and for flux quanta the electric field can be strong. The measured electric field is the average over flux tube electric fields.

If one knows the charge  $Q = Ne$ , one can deduce  $\lambda_{em,e}$ , which gives a reasonable estimate for the radius of the flux tubes as electric Compton length

$$r = \lambda_{em,e} = N \times \frac{4\pi\alpha}{\beta_0} \lambda_e .$$

This gives an estimate for  $E$ .

1. Gauss law gives

$$ES = Q = Ne .$$

One has  $S = x\pi r^2$ . For ordinary flux tubes one has  $x = 1$  and for monopole flux tubes  $x = 4$ .

2. The electric field strength  $E$  can be estimated from the Gauss law using the assumption  $r = \lambda_{em,e}$ .

$$eE = \frac{Ne^2}{x\lambda_{em,e}^2} = \frac{e^2}{Nx\lambda_e^2} \times \left(\frac{\beta_0}{4\pi\alpha}\right)^2 .$$

3. From an estimate for  $E$  can estimate  $N$  and from this the area of the flux tube as  $S = x\pi\lambda_{em,e}^2$ . The area scales like  $1/\beta_0^2$ . The area, which corresponds to the electric flux of single electron is

$$S_e = \frac{x\pi\lambda_{em,e}^2}{N} = N \times \left(\frac{4\pi\alpha}{\beta_0}\right)^2 \times x\pi\lambda_e^2 .$$

For  $\lambda_{em,e} = a_0$ , one has  $S = x\pi N^2 a_0^2$  and  $S_e = x\pi N a_0^2$ .  $S_e$  increases with  $E$  so that the density of electrons decreases.

4. At the larger electrode  $E$  is weaker and the number of flux tubes is by a factor  $M$  larger.  $M$  is in a reasonable approximation the ratio  $E_{small}/E_{large}$  of the electric fluxes.

### 4. Charge asymmetry and quantum coherence

The following argument allows us to understand the charge asymmetry in terms of a smaller quantum coherence at the larger electrode.

1. There are two cases depending on whether a) the smaller or b) the larger electrode is negatively charged. The electric flux  $Q = Ne$  of a single flux tube at the smaller electrode must decompose to  $M = E_{small}/E_{large}$  flux tubes at the larger electrode.
2. Quantum coherence is possible only at the level of a single flux tube. In the ideal situation quantum coherence at the smaller electrode corresponds to a single flux tube. At the larger electrode the flux tubes of the smaller electrode decomposes to  $M$  flux tubes.
3. The rate for the transfer of free electron momentum is proportional to the square of total number  $N^2$  of electrons at a given flux tube at the smaller electrode. In absence of coherence it would be proportional to  $N$ .

At the large negatively charged electrode the flux tube emerging from the smaller electrode decomposes to  $M = E_{small}/E_{large}$  flux tubes and the rate is proportional to sum over them giving  $M \times (N/M)^2 = N^2/M$ . Therefore the effect is stronger when the smaller electrode is negatively charged.

If the negatively charged electrode is the smaller one, the electric field strength and electrostatic energy decrease faster and the acceleration of the cm is stronger.

The reduction of the electric field strength implies the decrease of  $h_{em,e}$  in the process. The reduction of the electrostatic energy makes it possible to kick electrons to the electric body. In biocatalysis the reduction of  $h_{eff}$  is proposed to bring reactants together and to kick them over the potential wall. The reduction process of  $h_{eff}$  takes place as steps so that also the strength of the electric field should be reduced in steps. Is it possible to detect this?

### 4.3.3 The interactions between living systems and computers

The experiments of Peoch [J28] involved a chicken imprinted to a robot moving randomly along an orbit determined by a RNG. It was found that the robot tended to stay near the chicken and that the expected size of the orbit was reduced. Just for fun, let us take the reported findings seriously. Could one imagine an explanation for this finding in the proposed framework? I have discussed these findings already earlier [L8, L59, L65, L60, L58].

This model could also explain the claimed ability of human intention to affect the output of the random number generator (RNG). Both the work done at PEAR [J8] and the work of Helmut Schmidt with retro psychokinesis [J15] provide support for the change of the geometric past in much longer time scales. PEAR experiments demonstrate the anomalous effect also in the direction of the future.

Also the claims that the interaction of AI systems and humans could involve in particular GPT and humans, might make sense and I have discussed this possibility in [L8, L59, L65, L60, L58] from the point of view of zero energy ontology (ZEO) and TGD view of quantum gravitation. Also the large language models, in particular GPT, involve RNGs, and the first guess is that human computer interaction affects the RNG.

In the TGD framework, a natural assumption is that the interaction of living organisms and computers involves quantum entanglement. So, how the chicken-computer interaction, assumed to involve entanglement, could affect the RNG of the robot?

1. The states of the transistor represent bits in ordinary computers. The key element of the transistor has a Si/SiO<sub>2</sub> boundary. The transition SiO<sub>2</sub> ↔ Si+O<sub>2</sub> is assumed to take place in the case of ball lightning as an interaction between the electric body of Earth and the soil. This interaction is assumed to take place via a generalized Pollack effect and its reversal in the Earth's electric field. Could a suitable modification of this interaction take place also now?
2. Consider first the scales. The length scale would be of order 100 km, which would correspond to frequency 3 kHz, which is not far from the 1 kHz resonance frequency in the brain. The gravitational Compton length for the Sun corresponds to 50 Hz EEG frequency and the gravitational Compton length which is  $R_E/2$ . Could the gravitational MB of the Sun be also involved?

3. The first guess is that  $\text{SiO}_2$  and  $\text{Si}+\text{O}_2$  represent the values of a bit. These bits need not correspond to the bits in the usual sense but certainly this transition could affect the ordinary bit. In the transistor, the bit corresponds to the presence or absence of the collector current.

For an NPN transistor collector current is roughly  $i_C \sim I_s \exp(v_{BE}/v_T)$  and very small for negative  $v_{BE}$  and large for positive  $v_{BE}$ . Therefore  $v_{BE}$  controls  $i_C$  as a bit. Could one think that  $\text{SiO}_2 \leftrightarrow \text{Si}+\text{O}_2$  takes the role  $v_{BE}$ ? Could the transition  $\text{SiO}_2 \rightarrow \text{Si}+\text{O}_2$  stop the current  $i_C$  or vice versa somehow? For instance, could  $\text{O}_2$  molecules gather negative charge and stop the flow of the electronic current.

4. The basic problem is that water, which makes the Pollack effect possible, is not present in the computer. The proposal of [L59, L58] is that chicken and computer fused to a single entangled system at the level of MB. By stretching the imagination to extreme, could one think that chicken's MB or some higher level MB having size scale of biosphere could have controlled transistors as bits.

The dropping of dark protons to the chicken's biological body liberates electric energy at the level of its electric MB. Could this energy be transferred to the transistor instead of chicken and induce the decay of  $\text{SiO}_2 \rightarrow \text{Si}+\text{O}_2$  at the transistor? The resulting state would be like a miniature ball lightning [L68] in  $\text{SiO}_2$  system. The size of miniature ball lightning is a fraction of millimeter and the life-time varies up to a few seconds. This would make it possible to interfere with the computation by affecting the bit sequences generated by the RNG.

5. A possible objection is that this time scale is too slow. The motion of the robot is however slow. If also the RGN acts slowly, this might not be a problem after all.

#### 4.3.4 Extraterrestrial life in space plasmas in the thermosphere, UAP, pre-life, fourth state of matter

Paul Kirsch sent a link to an article "Extraterrestrial Life in Space Plasmas in the Thermosphere, UAP, Pre-Life Fourth State of Matter" by Rhawn et al [D6] (see this) describing sensational findings giving support for the existence of plasma life forms 320 km above the Earth in thermosphere. I have been talking for decades about plasmoids as primordial life forms so that these findings are extremely interesting from the TGD point of view. Here is the abstract of the article.

*"Plasmas up to a kilometer in size, behaving similarly to multicellular organisms have been filmed on 10 separate NASA space shuttle missions, over 200 miles above Earth within the thermosphere. These self-illuminated "plasmas" are attracted to and may "feed on" electromagnetic radiation. They have different morphologies: 1) cone, 2) cloud, 3) donut, 4) spherical-cylindrical; and have been filmed flying towards and descending into thunderstorms; congregating by the hundreds and interacting with satellites generating electromagnetic activity; approaching the Space Shuttles. Computerized analysis of flight path trajectories, documents these plasmas travel at different velocities from different directions and change their angle of trajectory making 45°, 90°, and 180° shifts and follow each other. They've been filmed accelerating, slowing down; stopping; congregating; engaging in "hunter-predatory" behavior, and intersecting plasmas leaving a plasma dust trail in their wake. Similar lifelike behaviors have been demonstrated by plasmas created experimentally. "Plasmas" may have been photographed in the 1940s by WWII pilots (identified as "Foo fighters"); repeatedly observed and filmed by astronauts and military pilots and classified as Unidentified Aerial-Anomalous Phenomenon. Plasmas are not biological but may represent a form of pre-life that via the incorporation of elements common in space, could result in the synthesis of RNA. Plasmas constitute a fourth state of matter, are attracted to electromagnetic activity, and when observed in the lower atmosphere likely account for many of the UFO-UAP sightings over the centuries."*

To my best knowledge, this article, published in the Journal of Modern Physics, is the first article mentioning UFOs and UAPs. Its impact factor is .86 but I am more interested in facts rather than impact factors. This is because during the last decades in theoretical physics, the journals publishing mostly about superstring theory and related fashions and fads have had tragically high impact factors, which has led to the stagnation of the field.

As becomes clear from the article, many of the findings have been known. Article says that there is still secrecy and fears related to the observations of plasma structures (plasmoids in the sequel) on Earth which are often interpreted as UFOs-UAP sightings. People do not want to get the label of a mad scientist. After 46 years as a mad scientist without funding and research positions, I understand their fears!

For more than 10 years ago (2007) I participated a conference held in Hessdalen, Norway, where "UFOs" appear regularly and learned that they behave like living intelligent beings and considered these objects in TGD framework [K92, K9]. The findings related to plasmoids in the thermosphere support this kind of behavior both at the level of individuals and collectively. The structures involved can be very large: size scales range up to kilometer scale.

The article of Rhawn et al [D6] contains a detailed summary of both the history of the development of the theoretical ideas related to plasmoid as a self-organizing structure bringing in mind prebiotic life forms and discusses various findings supporting these speculations made in both lab and in thermosphere. The experiments carried out in the thermosphere satisfy stringent scientific requirements so that it is very difficult to dismiss the findings.

### Plasmoids and biological life

The difference between plasmoids and biological life forms might not be as large as one might think. Biology involves cold plasmas.

1. Negatively and positively charged ions play a key role in the physics of cell membrane. One of the mysteries is what ionizes them! We have thought that electrolysis is understood. At least I find that I cannot understand it in terms of standard chemistry. The energies of ions gained in the electric fields involved are quite too small to induce ionization of atoms.

Intriguingly, also "cold fusion" [C5], so bitterly hated by colleagues, appears in electrolytic systems and would involve formation of dark nuclei as dark proton sequences at monopole flux tubes decaying to ordinary nuclei and liberating almost all nuclear binding energy [K18] [L9]. Magnetic flux tubes with large  $h_{eff}$  would allow dissipationless acceleration of say dark charged particles to very high energies making it possible to ionize that atoms.

2. In the TGD Universe, the charged ions communicate with the magnetic body of the system using "dark" (in the TGD sense) Josephson radiation and cyclotron radiation [L70]. Resonance, generalizing to multi-resonance, would be the basic mechanism. Same communications and control mechanisms would be realized in plasma life in which chemical realization of genetic code is not yet present. The genetic code could be realized in terms of dark protons and dark photons with genes realized as sequences of dark proton or dark photon triplets realizing genetic codons [L3, L19, L37].

The proposal is that genetic code is universal and based on so called completely unique icosahedral tessellation of hyperbolic 3-space  $H^3$  involving tetrahedra, octahedra, and icosahedra and appearing naturally in the TGD framework [L37, L54]. This tessellation could be realized in the plasma phase where crystal lattices are reported to appear. Information theoretically, biological life and plasma life could be very similar. Besides the basic morphologies of plasmoid mentioned in the abstract of the article, helical structures are formed and could serve as analogs of DNA and RNA and amino-acids: the information would be stored by the dark DNA realized as sequences of dark proton triplets.

The universality of both genetic code and information molecules (both DNA, RNA, amino-acids and tRNA are predicted to have dark counterparts) and the appearance of primitive metabolism already at the level of dark matter would solve various hen-egg paradoxes of standard biology.

3. One fascinating discovery is that the plasmoids seem to behave as if they were moving in water. Water is a key element of biological life. The temperatures in the thermosphere are in the range 200-500 Celsius and beyond the boiling point of water. What could serve as the plasma counterpart of water?

Long range coherence (mystery in the biology-as-nothing-but-chemistry approach) is required, in fact several scales of coherence are needed. In the TGD framework, the quantum

coherence of the monopole flux tube network, making it behave more like a liquid rather than gas, would induce the coherence of water. Could the monopole flux tube network also transform the plasma phase to a liquid-like system?

What could make possible quantum coherence at such high temperatures? TGD suggests that cell membranes realize high  $T_c$  superconductivity [K63, K64, K66]. High  $T_c$  superconductivity would be based on the hierarchy of  $h_{eff} > h$  phases at monopole flux tubes for which cyclotron energies are scaled up by factor  $h_{eff}/h$ . The most recent version of the model of superconductivity [L79] suggests that the transition to high superconductivity could quite generally involve the generation of what I call half-monopole flux tubes (possible as Maxwellian flux tubes requiring a current at the boundary to generate the magnetic field) with a disk-like cross section at a critical temperature  $T_{c1}$  higher than  $T_c$ . At  $T_c$ , half-monopole flux tubes would fuse along their boundaries to monopole flux tubes with a spherical cross section (possible only for homologically non-trivial space-time surfaces) and requiring no current. The difference between the total cyclotron energies associated with these configurations would be proportional to  $h_{eff}/h$  and the critical temperature would increase with  $h_{eff}/h$ .

4. The plasmoids are reported to have a double layered structure with both layers consisting of plasma with the inner layer carrying a negative charge and outer layer a positive charge. This structure is very similar to the double lipid layer associated with the cell membrane. Also these structures could be generalized Josephson junctions such that the voltage between the layers would define the counterpart of membrane potential.

The layers could be superconductors forming a generalized Josephson junction [K66, L70]. There would be monopole flux tubes transversal to the layers and the difference of energies for charged particles at the two sides of the structure would be sum of Josephson energy  $ZeV$  and the difference of cyclotron energies  $h_{eff}ZeB/m$ . The structure would communicate to its magnetic body by dark Josephson radiation. The communicated information would be about the electromagnetic environment coded by the modulations of the membrane potential in turn coded to frequency modulations of the Josephson radiation. The message would be received by cyclotron resonance generating as a response a sequence cyclotron resonance pulses analogous nerve pulse patterns sent to the biological body where they would act as control commands. Neural system would rely on this mechanism. The response would generate an analog of stochastic resonance whereas the Josephson radiation would generate the analog of the reversal of stochastic resonance [L77].

5. Also a gel-like behavior has been observed. Gel phases (see this) are essential in biology and involve a network plus medium (see the Wikipedia article). The medium can be gas, liquid, or solid and also the network can be one of these phases. Also the plasma phase could serve in the role of medium in the recent situation. The network formed by the monopole flux tubes and carrying dark particles as  $h_{eff} > h$  phases of ordinary particles could play the role of the network and together with the plasma phase forming the medium give rise to a gel-like phase.

In the TGD framework, the Pollack effect, generating a gel phase by transferring ordinary protons to dark protons at monopole flux tubes and in this way creating negatively charged exclusion zones (EZs, such as cell interior and DNA double strand), would be a building brick of key mechanisms of quantum biology. Pollack effect requires energy and solar radiation provides it and Pollack effect would be a key mechanism of also photosynthesis.

As I developed a model for ball lightning [L68], I realized that the Pollack effect [I25, I9, I43, I36] generalizes. The particles could transform to dark particles at the magnetic body, not only by absorbing a photon, but by a formation of a molecular bound state. Pollack effect and its reversal could control transformation of silicates (quartz) to silicon in a liquid phase: the energy of lightning would provide this energy and in this way generate ball lightning as a primitive life form. Is the generalized Pollack effect one of the key mechanisms of plasma life?

6. Quite generally, the energies of dark particles increase with  $h_{eff}$  and  $h_{eff}$  tends to decrease spontaneously. The basic purpose of metabolic energy feed is to compensate for the

decrease in the value of  $h_{eff}$ . Plasmoids should use electromagnetic radiation as a metabolic energy source just as biological life forms use. Can one imagine a plasma counterpart of photosynthesis?

Pollack effect is essential in the TGD based model of photosynthesis and defines a prebiotic form of photosynthesis, which would temporarily store energy to the magnetic body of the system, where dissipation is extremely small. The same temporary storage could take place when the metabolic energy, extracted from metabolites, is temporarily stored to MB in  $ADP \rightarrow ATP$  transformation.

It is known that plasmoids radiate even at the dark side of the Earth. This supports the view that they are able to store metabolic energy. The long term storage of metabolic energy could emerge when the charged dust particles interact with plasma and form colloidal gel phases (see this) with it. The molecules of the dust particles would store the energy for longer periods of time.

7. Plasmoids are found to gather above thunderstorms and descend to them. Thunderstorms involve large charges and strong electric fields and therefore give rise to MBs with very large values of  $h_{eff} = h_{em}$ , which has an interpretation as a measure for number theoretical complexity and also serves a universal IQ. Thunderstorms could also serve as metabolic energy storages. The acceleration of dark particles in the strong electric fields at monopole flux tubes would increase the value of  $h_{eff}$  of the particles.

#### Did plasmoid life serve as a midwife for biological life?

Somehow the plasmoid life should have evolved to biological life. The natural guess is that biomolecules evolved in the dust particles interacting with the plasmoids. For instance, they are known to become electrically charged. Carbonaceous chondrites (see this) are especially interesting dust particles since they contain water, silicates, and basic organic molecules such as amino acids serving as natural candidates for the storage of metabolic energy. Chondrites also contain glass balls, which must have emerged from liquid silicon, which suggests the occurrence of dielectric breakdowns. The TGD based model of ball lightning [L68] involves the transformation of silicate to silicon in liquid phase. The presence of the molecules pairing with their dark analogs (in information theoretic sense) could have led to the evolution of the chemical metabolic energy storage.

Could carbonaceous chondrites associated with double plasma membranes with layers having opposite charges have evolved in the thermospheres of the planets and stars from systems involving mostly silicates and water to systems containing basic information molecules like DNA, RNA, amino acids and tRNA? Could plasmoids have served as midwives in the process?

Here the theory of Oparin (see ) and the support for it provided by Miller-Urey experiment (see provide guidelines. Oparin suggested that life evolved in a strongly reducing (able to donate electrons and thus becoming easily oxidized) atmosphere lacking oxygen and containing methane, ammonia, hydrogen and water vapor.

In the Miller-Urey experiment a system assumed to simulate an ancient ocean containing very simple organic molecules was studied. Also heat gradient was involved. Lightnings were simulated as dielectric breakdowns in a strong voltage. Almost all amino-acids necessary for life emerged in the process. I have commented on the more recent findings related to this experiment from the TGD point of view in [L31, L47]. This leads to a long series of questions.

1. In the thermosphere the scale is that of a protocell. Could the protocell be realized as a double plasma membrane containing carbonaceous chondrites?
2. Could carbonaceous chondrite act like a strongly reducing atmosphere? Could the chondritic water take the role of the ocean in the Urey-Miller experiment and could the thermal gradient of the thermosphere replace the thermal gradient? Could dielectric breakdowns in the voltage of the double plasmoid membrane replace the lightnings?

Pollack effect requires energy feed. Could generalized Pollack effect induce the formation of the basic biomolecules such as amino-acids as bound states [L68]. Could the binding of oxygen to silicon to form silicates by the generalized Pollack effect make the chondrites strongly reduced by removing the free oxygen?

3. Did proto cellular life evolve in this way and migrate to the surface of Earth? At the surface of Earth the possibly existing oceans had a very low oxygen content and the energy flux from the Sun was too low (faint Sun paradox). It seems that the oxygen based photosynthesizing multicellular life could not evolve at the surface of the Earth. This conforms with the presence of multicellular fossils before the Cambrian explosion that occurred about 500 million years ago.
4. TGD suggests that the photosynthesizing, oxygen based multicellular life actually developed in the underground oceans below the surface of Earth, in the womb of Mother Gaia, where the conditions for the development of photosynthesis and multicellulars were more favorable [L41, L61]. It bursted to the surface of Earth in the Cambrian Explosion in which photosynthesizing multi-cellulars suddenly appeared. In the TGD Universe, the dark photons from the core of Earth might have provided the metabolic energy: the thermal radiation from the core is in the same energy range as solar radiation.

### Tether experiment

One especially interesting experiment involves a charged conductor wire (a tether connecting a module to the satellite) carrying an Ohmic current making the wire charged. The charge generates a radial electric field.

1. The nearly orthogonal motion of tether in the Earth's magnetic field  $B_E$  gives rise to Faray effect generating a voltage along the tether, which in turn induces an ohmic current and charge density creating a radial electric field. The current flows out at the other end of the tether. It is also possible to generate a current to the tether. The charge moving along the tether experiences Lorenz force orthogonal to  $B_E$  and tether which induces the motion. The article provides a quantitative view about the currents flowing along the tether, electric field strengths and total charges possible for the tether.
2. What is observed is that plasmoids gradually appear around this structure and make contacts with the wire. It is not clear whether they arrive from outer space or whether artificial prebiotic life forms are created as a response to the electromagnetic fields and electric current created by the electrons running in the tether!

In the TGD framework, the wire carrying a charge could give rise to a very large electric Planck constant  $h_{eff} = h_{em} = QZe^2/\beta_0$ , where the velocity parameter  $\beta_0$  satisfies  $\beta_0 = v_0/c < 1$ , is defined as generating large scale quantum coherence [L56].  $Qe$  is the charge of the large object and  $Ze$  is the charge of the small object.

This proposal generalizes the notion of gravitational Planck constant introduced by Nottale [E4]. I wrote just a few weeks ago two articles relating to this. The first one [L68] proposed a model of ball lightning and lightning. The second article [L56] discusses large scale quantum coherence in presence of electrically charged objects carrying large electric charge (Earth is the basic example and the charged wire second one).

Plasmoids would gather around the tether since this would increase the value of "personal"  $h_{eff}$  since the acceleration in the strong electric field would provide metabolic energy making it possible  $h_{eff}$  increasing phase transition. The presence of a tether's magnetic body would also help to reach a higher level of collective consciousness.

One can estimate the value of  $h_{em}$  for the tether system using the data provided in the Wikipedia articles (see this).

1. The current density can be written as  $j = \rho v$ , where  $\rho$  is the average charge density of the tether and  $v$  is the velocity parameter assignable to the electrons. This gives for the current  $I$  the expression  $I = \rho v S$ , where  $S$  is the cross sectional area of the tether. One can solve  $\rho$  as  $\rho = I/vS$  and from this the total charge of the tether as  $Q = \rho SL = IL/v$ .
2. One can use the length  $L = 20$  km of the tether and the reported typical values of the Ohmic current  $I$  and estimate  $v$  from a typical electron energy  $E$  as  $v = \sqrt{2mE}$ . From the Wikipedia article, the typical values  $I = 100$  mA and  $E = 10^2$  eV. The latter gives  $v = 2 \times 10^{-2}c$ . This would give  $Q = .33$  mC, that is  $Q \simeq 2 \times 10^{15}e$ . The value of

$h_{em}/h = Qe^2/\beta_0$  would be for  $Z = 1$  and  $\beta_0 = 1$  equal to  $8\pi\alpha \times 10^{15} \simeq 1.4 \times 10^{14}$ . 10 Hz alpha frequency would correspond to the energy of order .06 eV which happens to correspond to the Coulomb energy assignable to the cell membrane potential. This value of  $h_{eff}$  is near to the minimal value for which the cyclotron energy is above the thermal energy at room temperature.

## 4.4 How to define electric Compton lengths for planets and Sun

The simplest proposal for the electric Planck constant  $h_{em}$  for the pair determined by a relatively small charge  $Z$  and the charged system with large charge  $Q$ , is as a generalization of the gravitational Planck constant determined by the formula  $h_{em} = Qe^2/\beta_0$ , where  $\beta_0 = v_0/c < 1$  is a velocity parameter.

For the Earth, there are reasons to believe that  $\beta_0 \simeq 1$  holds true in the gravitational case. This implies that  $h_{em}$  has minimal value. For the inner planets of the Sun, Mercury, Venus, and Earth, one has in a good approximation  $\beta_{0,S} = 2^{-11}$  as was deduced by Nottale [E4]. For the outer planets, one would have  $\beta_0 = 2^{-11}$  but with principal quantum numbers coming as multiples of  $n = 5k$ ,  $k = 2$  for Mars, or  $\beta_0 = 2^{-11}/5$ . It turns out that the option  $\beta_0 = 2^{-11}$  for all planet-Sun pairs is correct [L74].

### 4.4.1 About the definition of electric Compton length

The definition of the electric Compton length is far from obvious.

1. The simplest definition of the electric Compton wavelength is given by

$$\begin{aligned} h_{em} &= \frac{Qe}{\beta_0} \text{ per}, \\ \Lambda_{em} &= \frac{h_{em}}{m} = \frac{h_{em}}{\hbar} \lambda . \end{aligned}$$

Proton Compton length  $\lambda_p = 1.32 \times 10^{-15}$  m and the Compton length of electron is by factor  $m_p/m_e \simeq 2000$  longer.

2. From  $C = 6.24 \times 10^{18}e$  and using  $E_E = x \times 10^2$  V,  $x \in [1, 3]$ , one obtains for proton  $\hbar_{em,E} \sim (4\pi\alpha_{em} \times 2.75x \times 10^{25}e^2/\beta_{0,E} \sim 10^{24}$ ,  $x \in [1, 3]$ . From  $\hbar_{em,E}/\hbar \sim 10^{24}$  the order of magnitude of  $\Lambda_{em,p}$  for Earth is  $\Lambda_{em,p} \sim 6.7 \times 10^9$  m  $\sim 10^3 R_E$ . Note that one has  $AU \sim 215R_S = 215 \times 109R_E \sim 2.34 \times 10^4 R_E$ .

From the point of view of the ionosphere, this estimate looks unrealistic. Ionosphere forms a capacitor-like structure and  $\Lambda_{em}$  should be smaller than the height 60-100 km of the ionosphere. The reason could be that the size scale of the quantum coherence region is overestimated.

3. Could one estimate the radius  $d$  of the disk defining the quantum coherence region at the surface of the Earth from the first principles? The natural guess is that  $d$  satisfies apart from a numerical factor the condition  $d = \Lambda_{em}(d)$ , where electromagnetic Compton length  $\Lambda_{em}(d)$  is for either proton or electron.

The interpretation would be that flux tubes carrying the electric flux are basic units and their cross section cannot span the entire area of the Earth. Electrons are the most important for the conductivity in the ionosphere so that they are favored. The conditions

$$\begin{aligned} \Lambda_{em} &= \frac{Q(S=\pi d^2)e}{\hbar\beta_0} \times \lambda , \\ Q(S) &= \epsilon_0 E_E \pi d^2 , \\ \Lambda_{em}(d) &= d . \end{aligned}$$

Here  $\epsilon_0 = 8.85 \times 10^{-12}$  C/Vm is the dielectric constant of vacuum. One Coulomb corresponds to  $C = 6.24 \times 10^{18}e$ . One can restrict the consideration to the surface of the system so that  $E(R)$  is the electric field at the surface,  $S$  is the surface area of the sphere, and  $R$  is the radius of the sphere.

4. The conditions give

$$\frac{1}{d} = X \times \frac{E_E}{\beta_0} \lambda \ ,$$

$$X = \pi \epsilon_0 \times 4\pi \alpha \frac{C}{e} \ .$$

where  $\lambda = h/m$  refers to either the Compton length of proton or electron.  $\Lambda_{em}(d) = d$  depends only on the value of the electric field for given particle so that one has

$$\frac{d(X)}{d(Y)} = \frac{E_Y}{E_X} \frac{\beta_0(X)}{\beta_0(Y)} \ .$$

This gives the scaling law  $d \propto \lambda/E$  so that one has  $d = \Lambda_{em}(d) \propto m$  unlike the ordinary Compton length  $\lambda \propto 1/m$ .

This formula applies to any planet and also to the Sun. It could apply also to ordinary capacitors and also to axons. The additional condition is that the electric Compton length in the case of capacitor type structures is smaller than the distance between the plates.

#### 4.4.2 The electric Compton length of the Earth

Consider first the electric Compton lengths for the Earth and restrict the consideration to proton and electron (the original version of the article contained a stupid error giving a wrong but reasonable looking estimate for the electric Compton wavelength of proton).

1. Assuming  $E_E = 100$  V/m this gives for the proton  $d_{p,E} \sim 8.5R_E > R_E$  so that the argument fails for protons in the case of Earth. This does not of course exclude the possibility that this notion makes sense in long length scales.
2. For the electron this gives for  $E \in [1, 3] \times 10^2$  V/m gives  $d = 4.25x \times 10^{-3}R_E$ ,  $x \in [1.3]$ , giving  $d \in [9.2, 27.5]$  km. This corresponds to the thickness of that part of the atmosphere where thunderstorms appear and size scales assignable to lightning. Lightnings could be seen as the analogs of action potentials if one takes seriously the analogy between cell membrane and ionosphere. The ionosphere has a lower boundary at height  $h \sim 60 - 100$  km, which is roughly twice the upper bound for  $d$  (which is of course determined only modulo a numerical factor of order 1).
3. Interestingly,  $\beta_0 \simeq 2^{-11}$  characterizing Sun would give for  $d$  the same estimate for in the case of protons. Could the protonic magnetic body correspond to the gravitational magnetic body of the Sun, which is in resonance with the electric body of Earth?
4. The radius of the thermosphere is about 340-350 km, roughly 5 times larger than the estimate of  $\Lambda_{em}$  for electrons.  $\Lambda_{em}$  represents however only a lower bound for the electric Compton length. The thermosphere is the area where the terrestrial plasmoids live so one can ask whether quantum coherence electrons could be involved.
5. If one knows the electric field  $E_P$  for the planet  $P$ , one can estimate the ratio  $h_{eff,E}/h_{eff,P}$  and the  $d_P$ . In the case of gravity,  $\beta_{0,E} = 1$  and  $\beta_{0,S} = 2^{-11}$  and a good guess is that this is the case also for all planets [L74].

Note that the gravitational Compton length of the Earth is same for all particles and given by  $\Lambda_{gr} = .5$  cm. One has for  $E_E = 10^2$  V/m

$$\frac{\Lambda_{em,e}}{\Lambda_{gr}} \sim 6.1 \times 10^6 \ .$$

In the number theoretic sense, the electric body would be considerably smarter than the gravitational body.

### 4.4.3 The electrical Compton length of the Sun

In the Zoom session, Ville Saari made a question related to the Sun as an astrophysical quantum system, and I realized that although I had estimated the electric Planck constant  $h_{em}$  for the Sun. For the Earth one has  $E_E = x \times 10^2$  V/m.

Consider first the electric Compton lengths for the Sun.

1. For the Earth one has  $E_E = x \times 10^2$  V/m,  $x \in [1, 3]$ . The value of the electric field at the surface of the Sun is  $E_S = 1.5$  V/m: this gives  $E_E/E_S = (x/1.5) \times 10^2$ ,  $x \in [1, 3]$ .
2. For the electric Compton length  $\Lambda_{ef}(d) = d$  of Sun one obtains from the scaling law

$$d_S = \frac{E_E \beta_0(S)}{E_S \beta_0(E)} d_E .$$

This gives  $d_S \simeq .033d_E \simeq .3$  km for  $E_E = 10^2$  V/m.

3. For the proton, the range of  $d_S$  would increase by a factor of  $m_p/m_e \sim 2^{11}$  to about [66, 198] km. Also this makes sense. Could the electric flux tubes relate to the solar wind? Not in any obvious way: the lower bound for the solar spot size is 1500 km.

One can also estimate the charge  $Q_S(d_S)$  for the Sun. If one uses also in the case of the Sun the scaling law and the condition  $d = \Lambda_{em}$  and assumes the same values of  $\beta_0$  in the gravitational and electric case and that electrons are in question, one obtains the estimate

$$\frac{Q_S(d_S)}{Q_E(d_E)} = \frac{E_E}{E_S} \times \frac{\beta_0(S)}{\beta_0(E)} .$$

This gives  $Q_S(d_S)/Q_E(d_E) = .033$ .

### 4.4.4 Electric Compton length for capacitor-like systems

To get some perspective and to test the idea it is useful to consider capacitors. In this case  $\Lambda_{em}(d) = d$  should be smaller than the distance between the capacitor plates.

1. Aluminium capacitors can have a maximum charge of about  $Q = 10^3$  C whereas the maximal charge of a van de Graaff generator is about .14 C. If one assumes  $d = \Lambda_{em}(d)$ ,  $d_C$  is obtained by scaling as  $d_C/d_E = E_E/E_C$ . If the capacitor corresponds to a sphere of  $D = 1$  mm with charge  $Q = 10^3$  C, the electric field is  $E_C = Q/4\pi\epsilon_0 D^2$  at the surface of capacitor and gives for  $D = 1$  m  $d_C = (E_E/E_C)d_E \sim 10^{-8}$  m for  $E_E = 10^2$  V/m.
2. For a capacitor with capacitance of 1  $\mu$ F and at voltage 1 V, the charge would be 1  $\mu$ C. For  $\beta_0 = 1$  would have the upper bound  $\Lambda_{em,p}/\Lambda_{gr} \sim 2.9 \times 10^{-3}$  so that one would have  $\Lambda_{em,p} \sim 1.5 \times 10^{-5}$  m. This gives an upper bound for the value of  $\Lambda_{em,p}$  since the parameter  $d$  must correspond to a solid angle smaller than  $4\pi$ . Could electronic systems be intelligent and conscious at least on this scale?

Neuronal axon is also a capacitor-like system and it is interesting to check what the criterion  $\Lambda_{em}(d) = d$  gives in this case. The natural guess for  $d$  as quantum coherence length is as the length of the axon idealized as a cylindrical capacitor. Using  $Q = E2\pi R d$  and the condition  $Q(d)e/\beta_0 = d$  one finds that the conditions does not depend on  $d$  at all so that it allows all lengths for axons, which is a very nice result from the point of neuroscience.

The condition however fixes the Compton length of the particle considered. Are there any chances of satisfying this condition for protons or electrons? The condition reads as

$$E \times 2\pi R \epsilon_0 \times (C/e) 4\pi \alpha = \frac{1}{\lambda} .$$

Here  $R$  is the radius of the axon taken to be  $R = 1$   $\mu$ m. Using  $E = V/D$ , where  $D \simeq 10$  nm is the thickness of the neuronal membrane. and assuming  $V = .05$  V, one obtains  $E = 5 \times 10^6$  V/m.

For  $\beta_0 = 1$ , the estimate for  $\lambda_e$  is in a good approximation  $\lambda_e = 10^{-12}$  m to be compared with the actual value  $\lambda_e = 2.4 \times 10^{-12}$  m. The equation  $d = \Lambda_{em}(d)$  is fixed apart from a numerical factor of order 1 so that the proposal seems to make sense.

If one assumes that Cooper pairs of electrons are the charged particles, one obtains  $\lambda_{2e} = 1.2 \times 10^{-12}$  m. If one scales down  $D$  with a factor  $1/2$  to 5 nm, one obtains  $\lambda_e = 1.2 \times 10^{-12}$  m, which could be true in absence of superconductivity. The thickness of the cell membrane indeed varies in these limits and is larger for neuronal membranes. One can wonder whether the dynamics is such that the quantity  $ER$  stays constant so that the condition remains true.

One can perform the same estimate for DNA strand having the 3 nucleotides per nanometer carrying unit charge. The condition  $\Lambda_{em}(Qe)\hbar\lambda/\beta_0 = (dn/dl)\alpha \times 4\pi(d/\beta_0) = d$  gives

$$\lambda = \frac{dn}{dl} \frac{\beta_0}{4\pi\alpha} .$$

The condition is satisfied for electron if one assumes  $\beta_0 \simeq 2^{-11}$ : one obtains  $\lambda = 1.5 \times 10^{-12}$  m to be compared with the actual value  $\lambda_e = 2.42 \times 10^{-12}$  m. The Compton length for a Cooper pair would be  $1 \lambda_{2e} = 1.21 \times 10^{-12}$  m.

#### 4.4.5 Could classical electromagnetic and gravitational fields give rise to collective consciousness in even historical time scales?

Paul Kirsch made an interesting question about whether the proposed gravitational and electric collective levels of consciousness assignable to Sun and planet could carry information about the history of biosphere and human kind. It is interesting to consider this question quantitatively by using the basic length and time scales predicted by TGD inspired quantum biology.

1. For the gravitational magnetic body of Earth the gravitational Compton length is  $L_{gr,E} = GM/\beta_0 \simeq .5$  cm ( $\beta_0 = 1$ ). For Sun one has  $L_{gr,S} \sim R_E/2$  ( $\beta_0 = 2^{-11}$  for the inner planets),  $R_E$  the radius of Earth. The corresponding time scales are rather short: .16 ns for the Earth and 10  $\mu$ s for the Sun.
2. For the electric fields of Earth and Sun the values of "IQ" defined by the electric Planck constant  $h_{eff} = \hbar_{em}$  can be considerably higher than for the corresponding gravitational fields. The condition  $\Lambda_{cr}(d) = d$  for the radius of the flux tube as coherence region restricts however strongly the value of  $h_{em}$ .

- (a) The electric Compton length  $L_{e,em}(d) = d$  for electron in the case of Earth corresponds to the range 9–27.5 km assignable to the lightnings and the fact that the upper bound is roughly one half of the height of the ionosphere. This scale is only the lower bound for the transversal quantum coherence scales and one can argue that the flux tubes could be longer but shorter than the height of the ionosphere so that this scale could closely relate to the plasma life.

If one does not pose the condition  $\Lambda_{em} = d$ , the electric Compton lengths for the Earth are much longer. For protons one obtains  $\Lambda_{em,p} \simeq 10^3 R_E$ . For electrons one has  $\Lambda_{em,w} \simeq 2 \times 10^6 R_E$  to be compared with  $AU \simeq 2.34 \times 10^4 R_E$ , the distance of Earth from the Sun.

- (b) For the Sun, the electric Compton length for electron defined by  $\Lambda_{e,em}(d) = d$  are rather short: .3 km for electron and 66 km for proton assuming  $E_E = 10^2$  V/m in the scaling. If one gives up the condition  $\Lambda_{em}(d) = d$ , one has  $\Lambda_{em}(S) = 2 \times 10^8 R_E$  to be compared with  $A = 2.2 \times 10^4 R_E$ .
- (c) For a pair formed by say charge  $Z$  and mass  $M$  and Sun, the electric Compton length and time are scaled up by a factor  $Zm_p/M$  from those of protons. This factor is in general smaller than one so that historical times scales cannot be obtained by increasing the charge.

The natural guess is that the electric and gravitational fields correspond to collective consciousness of some kind. Could it be the collective consciousness of the human kind or of the biosphere? Could our understanding of our physical environment rely on direct sensory experience of these collective levels of consciousness about their electromagnetic and gravitational bodies? Could our science based conscious information be represented on astrophysical scales so that the target of science could determine the scale of the corresponding cognitive representations?

Consider first the gravitational magnetic bodies.

1. For the Milky Way the mass is about  $1.55 \times 10^{12} M_S$ , the gravitational Compton length  $L_{gr,MW}$  would be for  $\beta_0 = 1$  about  $L_{gr} \sim 1.55 \times 10^{12} \times \beta_0(Sun)$  km  $\sim .8 \times 10^9$  km, which would give  $T_{gr} \sim .8 \times 10^7$  seconds, which is rather near to year which is  $3.2 \times 10^7$  seconds! For  $\beta_0 = 1/4$  one would obtain a year.
2. To get historical time scales in the gravitational case, one should have a larger astrophysical object, perhaps a local galaxy cluster. Galaxy clusters have masses  $10^2 - 10^3$  times the mass of the Milky Way. This would give a time scale of 100-1000 years, which is historical.

What about the electric Compton time for the Milky Way in the case of dark protons? Galaxy is estimated to have a Coulomb charge of about  $10^{31}$  Coulombs. The radius of the Milky Way is 52,850 ly. Using the definition  $\Lambda_{em}(d) = d$  and  $\beta_0 = 1$  one would obtain  $\Lambda_{em}(p) \simeq .42$  cm which happens to be rather near to the gravitational Compton length .5 cm for the Earth. For electrons one obtains  $\Lambda_{em}(e) \simeq 2.1 \mu$  m, which corresponds to the size scale of the cell nucleus. Quite generally the condition  $\Lambda_{em}(d) = d$  implies that  $\Lambda_{eff}$  is small and decreases with the size of the system.

## 4.5 How could Egyptian pyramids and rainmaking relate to each other?

I received from Zakaria Ahmindache a link to a very interesting article of Borisov published in Researchgate [I29](see this) with title "The Egyptian Pyramids-Connection to Rain and Nile flood Anomalies".

### 4.5.1 Background considerations

Since a topic involving words like ancient Egypt, pyramids and rainmaking probably induces strong emotional reactions in skeptics, it is good to include some TGD background and also make clear that the proposal of Borisov provides an excellent opportunity to develop the TGD based conceptualization of quantum biology by applying it.

#### A possible unification of various types of life and consciousness

I have taken a rather skeptic attitude to everything that involves ancient Egypt but at this time I felt fascinated. The reason was that during last weeks I have been working with a breakthrough in TGD inspired theory of consciousness and of living systems suggesting a unified view of different types of consciousness assignable to biosystems, plasmoids, quartz (possibly computers) and quite generally to any system, which involves cold plasmas and therefore ions [L75].

1. The key notion is what might be called OH-O<sup>-</sup> qubit. The transition OH  $\rightarrow$  O<sup>-</sup> + dark proton at the gravitational magnetic body of the Sun or Earth flips this qubit-like entity. This transition occurs in the Pollack effect [I25, I9, I43, I36], which has become a key notion in the TGD inspired quantum biology [L51]. The reverse transition occurs when the electron of O<sup>-</sup> is excited so that the difference of the bond energy of OH and binding energy of the electron changes sign. This effect might be called the dual Pollack effect.

This transition generalizes. Any salt can decompose to ions and the positive ion could be assigned to the gravitational magnetic body of the Earth or Sun. Biosystems are full of ions of this kind.

2. The dark variant of the genetic code is one of the basic ideas of TGD and one can understand it in a very detailed manner if the qubits associated with the phosphates of the double DNA strand and phosphates and ribosomes of a single RNA strand provide a representation of the genetic code. In proteins COOH could assign a single qubit to each amino acid.
3. This also allows us to see alcohols (see this), involving -OH as a key structural element, in a new light. Pollack effect could induce a kind of elevated state of mind. Psychedelics (see this) involve -NH as a key structural element and Pollack effect inducing the transition  $\text{NH} \rightarrow \text{N}^- + \text{dark proton}$  could be essential element of the psychedelic action.
4. The amazing finding is that in transistors the energy scales are the same, varying from about .5 eV (the metabolic energy quantum) to .15 eV (the energy of thermal photon at physiological temperature) as assigned to  $\text{OH} + \text{O}^-$  qubits. Therefore computers might under certain condition become conscious entities as speculated already earlier [L59, L58] and qubits could in the same relation to bits as dark qubits in information DNA and RNA to the bits of the genetic codons. This relation allows dynamics since only the minimum energy state of the codon corresponds to the chemical codon. Same would be true for computers. The gravitational magnetic body of Earth could receive information from the bit level and control it.

### Zero energy ontology

Zero energy ontology is a key notion of TGD and TGD inspired theory of consciousness and solves the basic paradox of the quantum measurement theory.

1. ZEO predicts two kinds of state function reductions (SFRs): the "big" ones (BSFRs) and the "small" ones (SSFRs). The sequence of SSFRs means in standard quantum theory repeated measurements of the same observables and gives rise to conscious entities, selves.
2. BSFRs change the arrow of time and from the point of view of self this means death or falling asleep. ZEO predicts that roughly half of the Universe has an opposite arrow of time. This part of the Universe might be called a "kingdom of dead".

Indeed, biological death changes the arrow of time in rather long scales and means reincarnation with an opposite arrow of time, eventually possibly followed by a reincarnation with an original arrow of time. Sleep is a temporary death in this sense.

### 4.5.2 A TGD inspired comment about the mythology of the ancient Egypt

The mythology of ancient Egypt has many analogies with the ontology of the TGD inspired view of consciousness.

1. The mythology of ancient Egypt suggests an interpretation in terms of zero energy ontology (ZEO). The "kingdom of dead" is non-observable using purely classical signalling since the signals from the other side propagate to the geometric past and do not reach us. Therefore we do not remember anything about the periods of deep sleep. The notion of ka fits nicely with this.  
"Big" quantum jumps (state function reductions, BSFRs) occurring in arbitrary long scales are predicted to be possible and rainmaking could involve such a pair of BSFRs and thus a visit to the "kingdom of dead" at some level of hierarchy. Trance of a shaman could be such a visit.
2. There is connection to the recent work involving  $\text{OH} - \text{O}^-$  qubit idea already described, possibly unifying plasmod-, quartz -, computer-, and biological consciousness [L75]. I have discussed the possibility of computer consciousness from the TGD point of view also in [L59, L58].

### 4.5.3 A TGD inspired model for rainmaking

As the title "The Egyptian Pyramids-Connection to Rain and Nile flood Anomalies" suggests, the article suggests that pyramids had a deeper purpose: they could be used to induce rain. This sounds madness in the ears of a standard physicist but in 1895, Charles Wilson, a physicist, meteorologist, and Nobel Prize winner, made a groundbreaking discovery: he proved that rain could be artificially created. The rainmaking technology has also been commercialized.

The key idea in making rain is that a generation of the negative electric charge in the quartz contained by the soil leads to its accumulation to the atmosphere. The negative electric charge in the atmosphere in turn facilitates the formation of water droplets around them and eventually this induces rain. Could TGD explain this?

#### The model of Borisov

Consider first the proposal of the article of Borisov [?].

1. A deceased king, along with jars containing provisions for the afterlife, is placed inside a coffer, which is a hermetically sealed volume. The jars contain beer, bread, grain, ox, and sweets. The provisions within the jars undergo fermentation, where yeast converts the sugars present in food into carbon dioxide, water, or ethanol. This process can occur within a sealed coffer with no air intake, as long as the necessary conditions for yeast growth are provided. Some studies have found that fatty acids present in ox meat are essential for sustaining this growth.
2. The carbon dioxide generated by the process cannot escape and increases the pressure in the coffer of which 40 percent is quartz. The pressure in turn generates by piezoelectric effect (see this) an electric field generating negatively charged ions, which would move through the moist lime-stone core of the pyramid towards its apex and would be eventually emitted.

#### The TGD based interpretation of the model of Borisov

Consider the TGD interpretation of this model.

1. The transition  $\text{OH} \rightarrow \text{O}^- + \text{dark proton}$  at gravitational magnetic body of the Earth (or Sun) occurs in quartz subject to electric field or under pressure in an electric field (piezoelectric effect transforming pressure gradient to electric field) and would generate negative ions.
2. In the case of a pyramid, the negative ions from quartz could flow to the tip of the pyramid and generate a high density of negative charge and strong electric field. From the tip the negative charges could flow to the atmosphere and serve as seats for the condensation of water droplets. Note that water is the key element of TGD inspired biology: Pollack effect [I25, I9, I43, I36] would generate negative charged exclusion zones and dark protons at the gravitational magnetic body.
3. The presence of electric fields changes the energy of the electron of  $\text{O}^-$  and by driving the difference of bonding energy and binding energy near the thermal energy, can make the system very sensitive to the transitions between the  $\text{OH-O}^-$  qubits. Quartz is a piezoelectet so that pressure gradients generate an electric field and have the same effect.
4. The TGD interpretation is that the electric fields increase the sensitivity of quartz to the generation of  $\text{O}^-$  ions plus dark protons at the gravitational monopole flux tubes. System would become to some extent living.

Fermentation (see this) creates alcohols, which contain the characteristic  $-\text{OH}$  group ( $\text{OH} \rightarrow \text{O}^- + \text{dark proton}$ ).

Does this process occur in the body of the king? Mummification means dehydration so that all moisture is removed so that the metabolism does not occur and the body does not decay. At the molecular level, dehydration reaction means that water molecules are removed from a molecule or ion. This can mean a removal of  $\text{OH}$  groups (see ). The basic information molecules contain  $-\text{OH}$  groups and  $-\text{NH}$  groups. This would suggest that in the mummified body the analog of the Pollack effect producing  $\text{O}^-$  and  $\text{N}^-$  qubits is not possible.

5. Could some kind of collective consciousness assignable to quartz and water in the atmosphere wake up during rainmaking and induce the rain as a pair of macroscopic BSFRs? This would have no explanation in the framework of standard physics and in this sense would be literally a miracle, which we however experience every night and morning.

## **4.6 James Webb Space Telescope is also revolutionizing biology**

JWST continues to make discoveries revolutionizing not only cosmology and astrophysics, but also the views about the evolution of life. The talk "Nobody Expected JWST To Find Signs of Oceans on Makemake and Eris + More From Kuiper Belt" of Anton Petrov (see this) told about the newest findings related to the Kuiper belt and about surprising findings related to the dwarf planets Eris and Makemake.

### **4.6.1 Second Kuiper belt?**

Consider first the discoveries related to the Kuiper belt made by satellite New Horizons. The Kuiper belt seems to be either much thicker than thought or that there are actually two of them. According to the findings of New Horizons satellite, the latter option looks more plausible. The candidate for a new Kuiper belt consists of a very dense dust. Solar wind could have blown the dust from the inner Kuiper belt to this region but this explanation is not very plausible.

TGD view of the formation of astrophysical objects [L63, L64] suggests the possibility of belt like structures and even spherical layers. The empirical findings suggesting that ionosphere involves plasmoids as primitive non-biological life forms suggests the symbiosis of biomolecules associated with the dust particles with plasmoids led to the development of primordial life forms [L56].

What came as a surprise to me was that the Kuiper belt is the most colored object in the solar system. The explanation would be the presence of organic molecules emitting light at visible frequencies. This also explains the reddish color of the belt. Also Pluto and many dwarf planets have turned out to have relatively young surface layers with an organic chemistry involving highly complex organic molecules, in particular molecules with ring structures. This suggests that the chemical life developed at the outskirts of the solar system and then moved inwards.

### **4.6.2 Dwarf planets are not we expected them to be**

JWST provided information suggesting that Eris and Makemake have oceans and complex surface chemistry. This makes them candidates for the seats of primordial chemical life. Orcus, Pluto, Haumea, Quaoar, and Makemake are dwarf planets in the Kuiper belt extending from the distance 30 AU of Neptune to the distance of 50 AU. Also some solar system's moons such as Neptune's Triton and Saturn's Phoebe might have originated in the Kuiper belt. Even the Moon could have emerged by a collision of an object possibly coming from Kuiper belts with Earth. Eris, at a distance of 68 AU and Makemake at a distance of 46 AU are examples of dwarf planets located outside the Kuiper belts.

In a sharp conflict with expectations, Pluto, dwarf planets and many moons are very active and involve a complex organic chemistry giving them their reddish colors. For instance, Pluto is very active. It possesses a thin exosphere and 5 moons creating tidal effects, which also can provide metabolic energy. JWST has now managed to provide information of elements present at the surface of Eris and Makemake and even isotope ratios D/H and C13/C12 at the surface of Eris and Makemake. This allows us to conclude that the surface is very young. An interesting question is how the active surface structure has emerged. Also evidence for geochemical processes, solid state convection, and subsurface oceans have been found. These oceans seem to resemble Enceladus, which is a moon of Saturn regarded as a strong candidate for simple extraterrestrial life. All that is needed by life on the Earth, including oceans, seems to be present.

Object	$M/M_E$	$R/R_E$	$\Lambda_{gr}/\mu m$	$e_{gr}/eV$
Earth	1	1	5e+03	2.48e-03
Pluto	.00218	0.18	10.9	0.11
Eris	.0028	.182	14.0	.09
Ceres	1.57e-04	.07	0.79	1.58
Enceladus	1.8e-05	.04	.09	13.8
Titan	0.023	.4	115.0	0.01
Ganymede	.025	.413	125.0	.001
Moon	.0123	.2727	61.5	.02

**Table 4.1:** The table gives for Earth, Pluto, some dwarf planets, and some moons of the solar system, their masses  $M$  and radii  $R$  using Earth mass  $M_E$  and radius  $R_E$  as units. Also gravitational Compton lengths  $\Lambda_{gr} = \hbar_{gr}/m = r_s/2\beta_0$  for  $\beta_0 = 1$  and corresponding energies  $E = h/\Lambda_{gr}$  ( $h$  is ordinary Planck constant) are given.

### 4.6.3 The TGD view of the findings

In the TGD view of life, the TGD counterparts of both gravitational and electromagnetic fields, differing many aspects from their Maxwellian counterparts, have a fundamental role, in particular the long range electric and magnetic fields of both Sun, Earth, and other planets would be important [L56]. The electric body of Earth provides electric fields in the ionosphere, which is in many respects analogous to the cell membrane.

One of the very first predictions of TGD was that any body with gravitational mass must have electric charge although it can be arbitrarily weak. The negative electric charge generating electric fields can be generated by the Pollack effect transforming protons of ordinary matter to dark protons at the magnetic bodies of various objects [L56]. Dark particles have an effective Planck constant which can be much larger than ordinary Planck constant. Darkness in this sense explains the missing baryonic matter and plays a key role in TGD based biology. Galactic dark matter in turn can correspond to what colleagues call dark energy and would be associated with long cosmic strings, whose thickening to monopole flux tubes is the TGD counterpart for the decay of the inflaton field generating ordinary matter.

Negative charges are a basic aspect of living systems: DNA, cell, and Earth itself are basic examples. The delicacy is that the charge separation generated in this way is between the biological body and magnetic body rather than the system and its environment in the ordinary sense. Charge separation is like loading of a battery and requires energy. The formation of biomolecules as bound states of simpler constituents could provide the energy needed by this process. Water and the formation of silicates would be essential ingredients. Also galactic cosmic rays could have served as a source of this energy in Kuiper belts.

In the TGD based model for terrestrial life the role of quantum is central. The gravitational Planck constant  $\hbar_{gr} = GMm\beta_0$  introduced by Nottale defines gravitational Compton length  $\Lambda_{gr} = \hbar_{gr}/m = r_s/2\beta_0$ ,  $r_s = 2GM$  as a fundamental scale to which one can assign gravitational Compton frequency  $f_{gr} = 1/\Lambda_{gr}$  and gravitational Compton energy  $e_{gr} = h/f_{gr}$  as biologically interesting parameters. The following table gives these parameters for  $\beta_0 \simeq 1$  assignable to the magnetic body of Earth and possibly also for other planets, their moons and dwarf planets. For the system formed by the Sun and inner planets one would have  $\beta_0 \simeq 2^{-11}$ . For the system formed by the Sun and outer planets one would have  $\beta_0 \simeq 2^{-11}/5$ . The following table gives these parameters for  $\beta_0 \simeq 1$  assignable to the magnetic body of Earth. Scaling gives the values of these parameters assignable to the magnetic body of the system formed by the object and Sun.

Note that for Earth the gravitational Compton energy is 2.48 meV. For the Earth the gravitational Compton frequency, possibly associated with a fundamental biological rhythm, is especially high. For the Earth the  $\Lambda_{gr}$  is for solar gravitational magnetic body with  $\beta_0 \simeq 2^{-11}$  equal to  $R_E/2$  and corresponds to  $f_{gr} = 50$  Hz which is EEG frequency. For Mars  $\beta_0 \simeq 2^{-11}/5$  one has  $\Lambda_{gr} \simeq R_E/4 \sim R_{Mars}/2$  and the gravitational Compton frequency  $f_{gr} \sim 100$  Hz is at the top of EEG spectrum. In a good approximation, one obtains from the table estimates for  $\Lambda_{gr}$  and

$e_{gr}$  by the replacement  $eV \rightarrow .1 \text{ meV}$  and  $\mu m \rightarrow 1 \text{ cm}$

#### 4.6.4 Scent of space

Heikki Hirvonen sent a link to a FB post about the scent of space (see this). He is the content of the FB post.

*"Astronauts say that space smells like gunpowder and burnt steak. It being a vacuum and all, space isn't often thought of as having a scent of its own. And while no one has directly smelled outer space, exposure without a helmet would be fatal. Many astronauts have reported that it smells like a mix of gunpowder and burnt steak. The odor is most noticeable after an astronaut returns to their spacecraft through the airlock and removes their helmet, at which point the lingering scent can be detected by both the astronaut who had been outside the ship and their crewmates who remained aboard.*

*It has been theorized that the source of space's scent is dying stars, which release molecules called polycyclic aromatic hydrocarbons, a chemical compound also found in coal, oil, and food as they near the end of their existence.*

*There's even a cologne named Eau de Space based on the smell, which was originally synthesized by biochemist Steve Pearce at NASA's behest to better prepare astronauts for every aspect of the job. Based on his interviews with astronauts who had been to space, Pearce described the aroma as hot metal, burnt meat, burnt cakes, spent gunpowder, and welding of metal."*

PAHs (polycyclic aromatic compounds) look like a possible explanation. They would produce IR radiation assigned with unidentified infrared bands (UIBs) and since the odour sensation at the fundamental level is based on IR light, UIBs could produce the sensation.

Consider first PAHs. I have considered PAHs several times while developing TGD view of quantum biology.

1. PAHs are obtained by fusing together organic molecules involving aromatic rings and are produced in burning and are often poisonous. The list of the basic properties of PAHs [I1, I10] (see <http://tinyurl.com/atx4t9a>) can be found for instance in [K8].

The properties of PAHs have led to the PAH world hypothesis stating that PAHs are predecessors of the recent basic organic molecules. For instance, the distances of aromatic molecules appearing as basic building bricks are the same as distances of DNA base pairs.

2. So called Unidentified Infrared Bands (UIBs) of radiation around IR energies  $E \in \{.11, .20, .375\}$  eV arriving from the interstellar space are proposed to be produced by PAHs. The UIBs can be mimicked in the laboratory in reactions associated with photosynthesis producing PAHs [I1, I10].
3. PAHs are detected in interstellar space. James Webb telescope found that PAHs exist in the very early cosmology 1 billion years before they should be possible in the standard cosmology! Furthermore, PAHs exist in regions, where there are no stars and no star formation [?].

The interpretation of the findings in the TGD framework is discussed in [L72] [K89]!

1. In the TGD framework, a possible explanation would be that the nuclei involved are not produced by hot fusion in stars but by dark fusion occurring at rather low temperatures. PAH world as a predecessor of recent chemical life would have developed in interstellar space.
2. The original TGD inspired proposal was that dark fusion preceded "cold fusion" associated with prestellar objects preceded ordinary nuclear and ignited hot fusion leading to the formation of the stellar core [L63]. The numerous anomalies related to the standard model of the Sun assuming that the energy is produced in the core of the Sun suggest that something in the nuclear physics of the Sun is badly misunderstood. The analysis of the anomalies in the TGD framework leads to a rather radical proposal assuming that also the interior of the Sun is at a rather low temperature and dark fusion prevails in this region. The core would be a quantum system analogous to the cell interior or even cell nucleus [L76]. Needless to say this would completely change our views about the Sun and of life and consciousness.

Sun would be in a well-defined sense a living system needing metabolic energy feed. Solar surface would contain a layer producing both solar wind and solar energy and would receive metabolic energy feed from outside, for instance from galactic black holes along monopole flux tubes. This view requires taking seriously the prediction of TGD that ordinary hadron physics is accompanied by several scaled variants of hadron physics. In particular,  $M_{89}$  hadron physics with a mass scale which is 512 times higher than for ordinary hadron physics [L76]. The transformation of  $M_{89}$  nuclei to ordinary nuclei would produce solar energy and also provide the Sun itself with metabolic energy.

3. In the TGD framework, this picture suggests that PAHs might have been created as an outcome of dark fusion in interstellar space. PAHs might have made possible a primitive form of metabolism and photosynthesis [K9, K92] at relatively low temperatures prevailing in interstellar space. This would have made it possible for plasmoids as primitive life forms to store metabolic energy chemically. The hypothesis about plasmoids as predecessors of the recent chemical life forms in the Earth's ionosphere is discussed in [L56].
4. Dark proton sequences, providing a universal representation of the genetic code, based on a completely unique hyperbolic tessellation known as icosahedral tessellation [L54], would have realized the genetic code for the plasmoids and the chemical code would have emerged later. Also the recent realization of the genetic code would involve sequences of dark protons, with genetic codons represented as dark proton triplets. The triplets of dark cyclotron photons forming quantal units would induce resonant transitions between the dark codons: 3-resonance would be in question. Genes with N codons would give rise to 3N-resonances and a universal addressing in the communications by dark 3N-photons with the message coded to frequency scale modulation.

This does not yet say anything about how PAHs and UIBs could relate to the scent of space.

1. Luca Turin (see this) discovered that the absorption of infrared light produces odour perception. The earlier view was that a purely chemical mechanism involving the attachment of odorant molecules to the odour receptors is the mechanism of the odour perception. At the basic level the odour sensation would be however produced by infrared light. In particular, space odour might be produced by the infrared light emitted by PAHs. This makes possible remote odour perception.
2. In principle, also the solar radiation at infrared wavelengths could induce the sensation of odour. The odorant molecules could be present in the air inside the helmet. They would be excited by UIB light arriving from interstellar space and emit IR photons as they return to the ground state. This would generate the sensation of the scent of space. In the long run sensory adaptation would lead to the situation in which the scent of space is not perceived anymore. When the astronaut is outside the aircraft sensory adaptation takes care that the sensation is not felt. The sensation is most intense when the helmet is removed after the return to the spacecraft.

Whether the UIBs are produced by ordinary chemical transitions associated with photosynthesis or its predecessor or whether they involve new physics suggested by TGD, is an interesting question to ponder.

1. This relates interestingly also to the Pollack effect, which is most effectively induced by infrared light. Pollack effect is indeed central in the TGD inspired quantum biology and is a non-chemical transition in which photons provide the energy kicking protons to the "magnetic body" of the molecule. It is also essential in photosynthesis and in a temporary non-chemical storage of metabolic energy to the magnetic body of the system.

In the Pollack effect and its TGD inspired generalizations, the photon would increase the value of effective Planck constant  $h_{eff}$  for the protons. This could make the Compton length of the radiation, emitted as a dark photon as the proton transforms to ordinary proton, very long.

2. Could the large value of  $h_{eff}$  make possible space scent even without the presence of PAHs in the nearby environment? Smell is usually regarded as a sense restricted to rather short scales. Basically it would be infrared vision. Could this make it possible to smell over astrophysical distances?!

In fact, insects are known to be able to smell over distances measured in tens of kilometers. Could the real reason be that the smell sensation is also now mediated by (dark) infrared photons rather than by diffusing odorant molecules? I learned from my chemist friend that the odour of vanilla cannot be produced artificially. Could one understand this in terms of dark IR photons?

Part II

**MOTHER GAIA HYPOTHESIS  
AND HUMAN  
CONSCIOUSNESS**

## Chapter 5

# Semi-trance, Mental Illness, and Altered States of Consciousness

### 5.1 Introduction

The stimulus leading to the birth of this chapter was rather personal question made with some tongue in cheek: Am I a schizophrenic? The basic motivation for this question was my life situation: I have found completely impossible to find any support for my work and despite my high level of education live practically without human rights. There must be some reason to this and it might not be only related to my heretic views about physics and consciousness and to the present neo-barbaric market economy stage of Finland and of western societies in general. Perhaps I differ from ordinary scientist in some way which, not only explains why I am a builder of theory of everything, but also induces aggression, repression and perhaps also fear in my analytically thinking colleagues. “What might this something different” be was my question, which I finally decided to resolve during the period of exhaustion following long-lasting writing project.

The first thing to realize was that I know very little about schizophrenia. So I went to the library and also read my Bible about neuroscience [J22] to find what schizophrenia is. Thanks are also for Gene Johnson about material. First, I realized that paranoid schizophrenia combined with manic-depressive characteristics and occasional anxiety disorders is probably a more scientific looking conceptualization for the label “crackpot”. Examples of symptoms: “peculiar philosophizing” is one of the characteristics of paranoid schizophrenia (TGD as a whole!); withdrawal from social interaction (I see this as supplanting); paranoia (my belief that I am supplanted!); megalomania (look only the inspired blurbs about new developments at my homepage); seeing me as a “secretary of God” communicating TGD through me (schizophrenics obeying voices, perhaps I mediate the message of “Gods” by writing!). All this fits nicely with the diagnosis. There are however big flaws. I express myself fluently by speaking (if allowed to do so, certainly not in academic circles!) and writing (if allowed to do so, certainly not in “big science” circles). I do not experience horrendous loss of my self, disappearance of my self boundaries nor total emptiness. What was also peculiar that I seemed to have all the basic disorders of mind when suitable symptoms were picked up! As if even the nastiest claims of my colleagues were true: I seemed to be a real poly-maniac! More seriously, what the results of this self-diagnosis demonstrated is the dis-ability of the modern neuro-science based psychiatry characterizing illness as a collection of separate symptoms to differentiate between altered states of consciousness, religious experience, meditative states and schizophrenia. What is really tragic and horrifying that many materialistic neuroscientists indeed identify all these states of consciousness as mental illness.

It seems that the reductionistic approach of neuroscience does not provide much insight to the basic subjective characteristics of mental illness. It seems that a more holistic approach (or “romantic approach”, as it was called by Luria) based on “stories” is needed. The book “The origin of consciousness in the breakdown of the bicameral mind” [J17] provides, not only a fascinating scenario about the evolution of modern consciousness from the consciousness of bicameral stone age man, but also a holistic view about schizophrenic consciousness. In fact, schizophrenics are regarded as bicameral men in his approach. When I received this book as gift from my friend

Ben Price, I was stuck with the definition of consciousness which looked very bizarre to me: Jaynes stated that stone-age man was unconscious but despite this hallucinating God's voice giving commands! Definition does not look so bizarre when one realizes that Jaynes differentiates between experience and consciousness whereas in quantum approach this kind of distinction is not useful. Time was not yet ripe for me to realize the deepness of Jaynes's ideas. Couple of years later, armed with the notion of self hierarchy; with concrete ideas about interaction between different levels of self hierarchy; the realization that we are much more than our neurons as conscious selves and with detailed models for basic aspects of brain consciousness, I was mature to realize that I can modify the story of Jaynes and that the impressive material gathered by Jaynes supports also the TGD based quantum version of the story.

To put it in nutshell, TGD version about the relationship of human consciousness to higher levels of self-hierarchy relies on the notion of semi-trance. During semitrance parts of brain entangle with some higher level, say the self associated with the social group, and are in trance and therefore unconscious. The remaining parts of brain are however conscious and receive communications from the collective consciousness via the entangled region of brain as sensory hallucinations, emotions and thoughts. Semitrance is absolutely essential for the self-narrative: without it our consciousness would consist of memory fragments lasting only few seconds: higher level selves tell us where we come from and where we are going. Bicameral man received the commands and advices of the collective consciousness as auditory and visual hallucinations via regions of the right brain hemisphere wherefrom they were communicated to the left hemisphere whereas modern man receives these communications as thoughts ("internal speech") in left brain semitrance and emotions in right brain semitrance.

The evolution of modern consciousness meant a gradual development of the simplest God+ few men two-leveled hierarchy to a refined many-leveled hierarchy of selves having social hierarchy as its social image and various higher level selves talking with the voices of the persons in the hierarchy. At the same time subjective consciousness evolved: left and right brain became more and more entangled and semitrance periods became briefer, left brain began to inhibit the communication of sensory hallucinations from right to left brain, and sensory hallucinations transformed to thoughts and emotions. Thus the loss of "God's voice" did not mean the loss of semitrance communications and they are absolutely essential for the survival of the social structures and for modern self-consciousness. It is however quite possible that modern man spends much shorter fraction of time in semitrance than his bicameral cousin.

Since our genome does not differ much from that of stone age man, this process is much more a self-organization process than evolution of genome. By "ontogeny recapitulates phylogeny" principle this development is expected to repeat itself during the development of individual during the first years of childhood about which we not remember anything. This explains the Father-God and Mother-Goddess associations and the strongly reactive attitudes to religion resembling often strongly rebel against father. The average effective cognitive and emotional ages of the individuals of a civilization characterize the developmental level of the civilization.

According to this view, schizophrenic spends in the bicameral state larger fraction of time than normal person and receives communications of the higher levels selves more often as sensory hallucinations than as thoughts and emotions. Thus schizophrenia can be seen as cognitive and emotional abnormality and becomes illness in modern society relying crucially on cognitive and emotional self-narrative which is much more refined than the self-narrative based on sensory hallucinations. In normal consciousness left brain hemisphere inhibits the messages from right hemisphere, left and right hemispheres are totally entangled a considerable fraction of time and the entanglement with higher level selves can also involve the entanglement of entire brain leading to short periods of total trance. In this view negative periods of schizophrenia correspond to the phases when right brain hemisphere is not entangled with higher level selves and positive, psychotic periods to the phase when this entanglement occurs often. This vision generalizes also to manic-depressive and anxiety disorders and one can see mental illness as disorder of communication between human brain and higher levels of self hierarchy.

Semitrance mechanism provides also more detailed understanding about various altered states of consciousness and extrasensory perception (hypnotic state, telepathy, clairvoyance, meditative states, identification experiences). It has been said that schizophrenia is drowning into the sea of consciousness whereas deep meditation is swimming in this sea. I believe that this statement is to the point. My fascination to the problem of consciousness was initiated by a deep and

long-lasting altered state of consciousness which began with a period, which might be characterized as conversation with God, Great Mind, as I called it: sounds very schizophrenic if one sees only collection of symptoms! It seems that circle is closed now: I believe that I finally understand what was behind this experience and “what is wrong with me”. Like other modern men, I am receiving emotional and cognitive messages from higher level selves. What distinguishes me from the average person is the abnormally long fraction of time spent in semitrance state. I do not get drowned to the sea of consciousness and I am able to write these lines as a “secretary of God”. I even dare to believe (put it on account of megalomania) that the age of modern man having no Gods is coming to its end with the recent neo-barbarism of the market economy. Our species can survive only if it keeps in contact with higher level selves and allows room for modern bicameral men and women sitting at computer terminals in semitrance and feverishly typing the messages of, not Village Gods, but much mightier Web Gods to the computer screen.

This chapter was written roughly decade before the emergence of many key notions of TGD now. This includes hierarchy of Planck constant defining a hierarchies of dark matter and macroscopic quantum phases, and negentropic entanglement. The notion of semitrance however make sense also in the new framework and allows formulation in terms of negentropic entanglement.

The appendix of the book gives a summary about basic concepts of TGD with illustrations. Pdf representation of same files serving as a kind of glossary can be found at <http://tgdtheory.fi/tgdglossary.pdf> [L2].

## 5.2 Semitrance

The original path to the model for the interaction of collective consciousness with individual was via the book Jaynes [J17]. It is however more appropriate to represent the problem and its solution without any reference to Jaynes’s idea to demonstrate that the scenario of Jaynes with only slight modifications follows from very general assumptions.

### 5.2.1 How Societies Of Idiots Can Behave Intelligently?

Animal kingdom is full of species forming societies: ant nests, beehives, flocks of birds, packs of wolfs, groups of apes, human communities. Also organisms can be regarded as cell communities. The ability of these societies to behave as single coherent whole although individuals behave in a random looking manner, is a mystery. Especially mysterious this ability looks in case of termites: the architectural feats of the termites are not consistent with the fact that the brain of termite consists of few neurons. Mechanisms explaining this as unconscious self-organization based on chemical communication or communication by direct contact have been proposed. I find it however difficult to understand how even stone-age men wandering around randomly and communicating intensively could have managed to build Gothic cathedral. This kind of achievement requires the presence of a conscious collective intelligence able to plan and control individuals of the community telepathically. There is indeed evidence for telepathy in ant community described in the article [J16].

This raises several questions. How collective consciousness is possible at all? How collective consciousness could be realized without total loss of individuality? How the rather limited intelligences of individuals can sum up to a high collective intelligence? What mechanisms collective self uses to control and coordinate the behavior of the individuals?

### 5.2.2 Semitrance As Basic Mechanism Of Communication Between Collective Consciousness And Individual

Self hierarchy is the basic prediction of TGD inspired theory of consciousness and self hierarchy makes possible collective consciousness. The experience of self is abstracted “sum” over the experiences of its sub-selves so that sub-self is experienced as a mental image. In the abstraction process the experience of sub-self is replaced with an “average” over the mental images of sub-self. The intelligence of the antnest results from summation of the mental images abstracting the contents of consciousness of the individual ants. This explains why ant group containing overcritical number of ants can act as an architect. The concrete realization of the self hierarchy in biomatter has been

discussed in [K16]. The most important conclusion is that we are much more than our brains: our mental images correspond to “ELF selves” associated with various EEG frequencies. These “ELF selves” have as geometrical correlates topological field quanta representing ELF em fields. Topological field quanta can have size of order Earth’s circumference. The interaction of these topological field quanta (say fusion to form larger structures) provides a mechanism giving rise to larger selves and makes possible telepathy and various other EPR phenomena as also experiences involving communications with deceased persons [J2].

### Semitrance

How collective self can control and coordinate the behavior of individuals? Some kind of communication mechanism making possible collective consciousness to give commands to the individuals is clearly needed. The entanglement of individual with collective self leads to a total loss of consciousness of the individual and can be regarded as sleep or trance state, possession. For instance, during mating rites of birds, male and female seem to behave like single conscious unit formed by male and female.

Social animals are however not mere organs of a higher level organism, they are also individuals. To explain this one can consider a mechanism which might be called “semi-trance”. If individual consists at least part of time of two separate sub-selves, second sub-self can entangle with collective self and in this trance state can communicate with the second self and communicate commands or advices to the sub-self which is awake. Communication is here quite generally understood as a generation of mental images: this corresponds to waking-up of sub-selves. The wake-up process initiates self-organization leading to a final state pattern representing the message. Final state pattern depends only weakly on the stimulus serving as message: this is as it should be.

Brain hemispheres or parts of them are the most obvious candidates for these two sub-selves. The entanglement of the right or left brain hemisphere (or some part of it, perhaps the linguistic regions with respect to which human brain has highest asymmetry) with a collective self could be the basic mechanism making it possible to communicate the commands of the collective self to left and/or right hemisphere as “hallucinations”.

Jaynes’s vision about the evolution of civilization is based on the notion of bicamerality [J17] provides strong keys to the nature of semitrance state and how it has changed during cultural evolution.

1. Jaynes assumes that right brain activities were unconscious to bicameral man and that the left hemisphere received the volition of right brain hemisphere as commands and advices as hallucinatory voices and visions. This would suggest that in the case of ancient bicameral man it is right hemisphere or parts of its that fall in trance and that left brain hemisphere receives the commands from right hemisphere as sensory “hallucinations”.
2. In case of modern man situation is presumably different. The average time spent in semitrance is probably shorter; the probability to fall in semitrance state is lower; the profile of semitrance is different and the communications between right and left brain hemispheres are probably different. Inhibition of the sensory communications developed so that the sensory messages from the right brain hemisphere to left hemisphere became inhibited: visions and God’s voice disappeared. The profile of the communications of the collective self to human brain changed also. Modern man receives the messages of the collective self both via left and right hemisphere semitrance. Spontaneous thoughts and ideas are received via left brain semitrance. Emotions and moods are received via right brain semitrance and guide the behavior of individual much more implicitly than direct commands. Thus sensory “hallucinations” have transformed to imaginative thoughts and emotions which we do not regard as hallucinations at all: the ancient world of elves, gods and demons has transformed to emotions and to the Platonic realm of ideas.
3. In this framework the development of civilization from primitive agricultural communities of 8000 B.C. to a modern society can be seen as the gradual establishment of “memetic code” [K37] implying the parallel development of language and society: “In the beginning there was the Word”.

The characteristic feature of semitrance is the passivity of the experiencer: collective self communicates experiencer something or gives possibly commands. They are not hallucinations in which the experiencer would hallucinate volitional acts. Only activity in the sense that experiencer has conversation with the higher level self seem to be possible. Of course, this conversation could induce changes in the behavior of the collective self: consider only the claimed effects of prayer.

Semitrance mechanism is extremely general and could be at work in brains of all social animals, especially those which as groups exhibit an intelligence much higher than the intelligence of the members of the group. Similar mechanism could work also at cellular and biomolecular length scales. DNA double strand and cell membrane consisting of two lipid layers are indeed binary structures and the components of the structure could serve in the role of right brain lobe. This mechanism would explain why cell society can behave like an organism with self identity. The observed possibility of humans with high EEG coherence to intentionally affect the degree of winding of DNA strand [138] supports the notion of semitrance at DNA level.

### **Semitrance and personal narrative**

If the contents of consciousness of self involve temporal average over moments of consciousness occurred after last “wake-up”, the duration of our self cannot be much longer than .14 seconds since this would mean that we could not discriminate between events with time separation not longer than about .14 seconds. This problem can be partially circumvented if our experience is multi-time experience containing several sub-selves of this duration. The duration of the short term memory is few seconds and this might represent the duration of our self. This raises the problem how we can have long term memories and self-narrative.

Geometric memories containing contributions from entire life span provide a candidate for the self narrative as a model for has happened and what will happen assuming that no quantum jumps have occurred before and will occur after this quantum jump. This need not however be enough since it seems that geometric memories must correspond to episodal memories only rather than the declarative long term memories often expressed as internal speech. Geometric memories are also expectations rather than genuine memories about conscious experiences and one can argue that we have genuine subjective memories about what really happened. Furthermore, “Ontogeny recapitulates phylogeny” principle suggests that the time interval spanned by our geometric memories is same as that spanned by subjective memories and thus few seconds. This leaves only one possibility: higher level selves must communicate to us information about their subjective memories whose time span is much longer than the time span of our personal subjective memories.

Semitrance mechanism seems to provide the most plausible manner to have self-narrative telling where we have come from and where we are going to. Thoughts and emotions, cognition and motivation, are the manner how higher level selves express this self-narrative to a modern man. Indeed, the time scales of emotions and moods are slow. The time scales for the action of second messengers and hormones are slow and involve changes of the synaptic strengths and modifications of the gene expression so that they could be perhaps identified as tools used by higher level selves to control the behavior of the organism. Perhaps also our cells have their own self-narratives provided by us and making possible such miraculous feats like DNA transcription: genetic determination could indeed be a long term goal of cell!

### **Thoughts, emotions, motivations and semitrance**

One can imagine two strategies for how higher level self could communicate to us our self-narrative as thoughts and emotions.

1. Higher level self could communicate both geometric and subjective memories and allow us to perform the comparison generating emotions.
2. Higher level self could compare geometric and subjective memories and communicate the result of comparison to us as emotions. In this picture emotions are essentially generalized sensory experiences. The fact that the borderline between emotions and sensory experiences (pain is good example) is very difficult to draw, favors this option. This option, when combined with the identification of the quantum correlates of the sensory qualia, implies that

the spectroscopy of consciousness provided by the magnetic transition frequencies applies also to emotions [K35].

Support for this identification comes from several sources. Thoughts are not direct reactions to sensory experience. Ideas pop out of nowhere. The explosive development of science and technology is perhaps the best example of the non-predictability of thoughts. The changes of emotions can be non-predictable and not direct reactions to sensory input but resulting from the comparison of what was expected or desired with what really happened and thus involving self-narrative in an essential manner. Expectations correspond to geometric memories and self-narrative tells what really happened: the comparison yields emotion serving as a control tool. Since self-narrative is told to us the one who makes ultimate comparison must be higher level self. The fact that music couples strongly to the “hallucinatory” regions of right brain hemisphere and affects strongly our emotions, suggests that music is language of emotions.

Spectroscopy of consciousness provides additional insight to emotions consistent with the considerations above. Magnetic and  $Z^0$  magnetic transition frequencies could parameterize the spectrum of both sensory qualia and emotions. The smaller the frequency, the more emotional the experience since the corresponding time scale is longer and deviation between the expected and real can be larger. Hence emotions could have as their correlates the cyclotron frequencies defined by the magnetic field assignable to the personal magnetic body carrying a magnetic field  $B_{end} = 2B_E/5 = .2$  Gauss ( $B_E$  denotes the nominal value of Earth’s magnetic field) explaining the findings of Blackman and others [K30]. These frequencies are below 8 Hz. Since cyclotron frequency is inversely proportional to the mass of the charged particle, this implies that emotions must be associated with biomolecules (second messengers, hormones, etc...).

Synesthetes are able to experience very lively episodal memories. It might be that it is possible to have multitime conscious experience with a time scale of order life span or even longer as the possibility of transpersonal states of consciousness suggests. A phase transition increasing the value of the p-adic prime associated with brain temporarily could make possible to have extended state of consciousness with subjective and geometric memories with the time scale of life span.

### Stress and semitrance

Stress is known to induce hallucinations in schizophrenics. This suggests that stress is a general mechanism inducing entanglement with higher level selves. The basic mechanism could be very simple. In case that brain decomposes unentangled parts representing separate selves, say part of right brain hemisphere and rest of brain, this part of right brain hemisphere can get tired and “fall asleep” which means nothing but semitrance. This makes possible the communications of higher level self to that part of brain which is awake.

Semitrance provides an alarm clock mechanism. The natural function of the holistic language regions of right brain is to remember what task primitive man was performing (say carving some tool). If the bicameral state for, say linguistic regions, dominated, semitrance began when right brain got tired and fall asleep. But just this semitrance induced “God’s voice” telling for left brain hemisphere what task bicameral man was performing! Also in the situations in which bicameral man did not know what to do, stress caused semitrance and immediate advice from the collective self. It is quite possible that the voice of conscience does it best to perform the same function in modern man! What has happened is that commands have transformed from sensory hallucinations to thoughts.

Heavy stress could also induce the splitting of entangled brain to two unentangled sub-selves so that collective consciousness takes the lead when right brain hemisphere or parts of it fall asleep. For instance, the exceptionally stressing situations encountered in war presumably lead to situation in which collective consciousness takes control and soldiers behave like single organism. Too much alcohol, which probably has same effect as stress, leads to the splitting of the visual field to right and left fields: this might be interpreted as de-entanglement of right and left visual fields. This state does not yet represent the state in which right brain or part of it has fallen asleep. Further stress leads to semitrance causing delirium. Note that also reduction of left-right inhibition must be involved with the stress.

The short period between wake-up and sleep state involves often visual and auditory hallucinations. This to be expected if falling asleep involves the decomposition of the brain to separate

unentangled regions which fall asleep at different times. The lack of sleep leads also to a hallucinatory state. These phenomena support the view that stress can split self to two separate selves followed by the trance state of the right or left hemisphere or parts of it. The fact that sensory hallucinations are involved would suggest that sensory regions of the right hemisphere fall asleep first and communicate “God’s messages” to the left hemisphere.

Spinning causes dizziness and is therefore a good candidate for a stimulus causing semitrance. This could explain the social role of dance. Dance is very important also in many religions, spinning dervishes are good example of this. Children love to spin around: the reason is perhaps that spinning around induces the semitrance state of the early childhood. The dizziness caused by ill functioning of the sense of balance involves spinning like feeling in either direction. This suggests that hemispheres tend to stimulate experience of spinning in opposite directions but that normal situation they manage to inhibit each other.

One can wonder how stress leads to de-entanglement. Entanglement corresponds geometrically to the presence of flux tubes along which Josephson currents flow. This would suggest that de-entanglement involves the splitting of the join along boundaries bonds/flux tubes. This is possible if Josephson current vanishes: this happens if the density of the superconducting charge carriers becomes sufficiently low. Thus it seems that the disappearance of superconductivity is the required condition. Perhaps dissipative effects might cause this: the increase of temperature over critical temperature at relevant space-time sheets could cause this. This would suggest that brain is near criticality for the phase transition leading to the disappearance of super conductivity. This is in accordance with quantum criticality of TGD Universe.

### Semitrance and EEG

TGD predicts two kinds of EEG waves [K69]. Propagating waves are typically associated with linear structures such as nerve circuits and left brain hemisphere is excellent candidate for corresponding selves. Large number of sub-selves representing mental images are predicted and the analyticity, reductionism and temporal linearity of left brain processing can be understood if left brain waves are dominantly propagating ones. Non-propagating waves can be associated with any structure of arbitrarily large size. The corresponding mental images can therefore be holistic and correspond to large region of brain.

The regions of right brain hemisphere are excellent candidate for a seat of nonpropagating EEG waves. Quantum entanglement of sub-selves gives rise to the formation of parts from wholes and it seems that brain halves provide reductionistic and holistic representations of sensory percepts. As far as sensory experience and emotion is considered, it is right brain which indeed seems to be holistic.

Standard wisdom is that right viz. left brain hemisphere are responsible for holistic viz. reductionistic aspects of consciousness respectively. There is however also conflicting evidence [J18] and it might be that there is some kind of division of labour [K73] such that right brain concentrates on sensory holism and left brain concentrates on cognitive holism. The experiments indeed suggest that it is left brain which recognizes holistic aspects of figures representing symbols and consisting of smaller figures representing also symbols. This would suggest symmetric scenario in which regions of both right and left hemispheres can entangle with collective selves and give rise to cognitive and emotional communication from higher level selves in modern man. This supports the view that also left brain hemisphere regions can support non-propagating EEG waves. Gap junction connected neuron groups provide candidates for regions allowing non-propagating EEG waves.

The entanglement with collective self corresponds to the formation of flux tubes between corresponding mind-like space-time sheet and the space-time sheet associated with some part of brain. This is expected to occur naturally if brain space-time sheet is in state corresponding to non-propagating EEG wave.

It would be interesting to check whether there are some anatomical and neurophysiological differences between the brain hemispheres of social animals. Of course, mere reductionism-holism difference, which is not obvious anatomically, is enough. The differences of right and left brain EEG: s could be also informative. One could also study whether different brain lobes react differently to stress.

### Both hemispheres entangle with higher level selves

The functional anatomy of brain is asymmetric: it is left brain hemisphere which is responsible for the production of speech whereas both hemispheres understand speech. Wernicke area on the left lobe and its mirror images are responsible for the understanding speech. Wernicke's area and its mirror counterpart are connected by anterior commissure. Broca area and supplementary motor cortex on left side are responsible for the production of speech. The removal of the supplementary motor cortex or Broca area yields loss of speech which is however not permanent in case of supplementary motor area. This specialization is dynamical and results from self-organization. Very ambidextrous people can have speech on both hemispheres and injury to Wernicke areas in early youth can lead to a generation of the speech areas in right hemisphere. Right brain contains counterparts of the speech production areas of the left hemisphere with no obvious function. What is surprising that large amounts of right brain tissue can be removed with surprisingly little deficits on mental function. The idea that these areas are completely useless is not attractive idea knowing that evolution has been extremely economical. So, what has been and what is the function of these areas?

The TGD inspired hypothesis modifying Jaynes's original proposal is that both Wernicke area and its mirror image of modern man entangle with higher level selves and mediate their messages as thoughts in left hemisphere semitrance and emotions in right hemisphere semitrance. Imaginative thoughts and emotions are indeed more than just mechanical reactions to sensory input. In the brain of a healthy person brain hemispheres inhibit each other during normal consciousness but when the inhibition of right brain does not occur for some reason, "God's communications" to the right hemisphere are mediated to the left hemisphere via anterior commissure as sensory hallucinations. This inhibition is also needed to avoid splitting of perceptive fields to two parts. This kind of splitting implied by de-entanglement together with inhibition might be especially useful in cognitive regions since it would make possible internal debate between holistic and reductionistic sub-selves.

Rather interestingly, in case of dogs and rats anterior commissures connect olfactory areas of brain. In this case odors might be in same role as voices in case of human brain. The idea about Dog-God expressing its will and advices using odor hallucinations does not sound so weird when one realizes that even human perceives huge number of different basic odors [K35].

In this framework one can make guesses about the profile of the bicameral consciousness assuming that schizophrenics are bicameral men living in wrong time and place.

1. The evolution of modern man meant evolution of the entanglement profile of semitrance. Today "Godly communications" are experienced as ideas and emotions whereas bicameral man experienced them as sensory hallucinations. Presumably right brain dominated as the locus of semitrance communication as suggested by the higher average intensity of EEG in right brain hemisphere of schizophrenic. Also cognitive semitrance was possible but the higher level selves were much more primitive than their modern followers since their intelligence was sum of much lower intelligences over much smaller number of individuals.
2. The brain of ancient man was part of time in entangled state but unstable against transition to split brain state induced by stress such that right brain sub-self was unstable against the entanglement with collective consciousness leading to semitrance in several sensory modalities. This occurred when ancient man got tired or encountered some novel situation causing stress. The anterior commissure connecting Wernicke area and corresponding area on right side is thicker in the brain of schizophrenic: this favors auditory communications between the Wernicke regions and auditory semitrance. Note that thoughts are a special case of auditory experience in TGD framework [K35] so that the replacement of "God's voice" talking through the right hemisphere with thoughts experienced via left hemisphere (Wernicke region?) as internal speech is a rather natural mechanism leading from bicamerality to modernity.

### 5.2.3 Various Aspects Of Semitrance State

#### Social interactions and semitrance

"Synchrony of the personal chemistries" is example of those aspects of social interactions involve aspects which are difficult to understand if one assumes that we are robots sending messages

to each other. Social messages contain perhaps much more than the formal information understood and expressed by the left brain hemisphere. Certainly the emotional content of the message is crucial and is believed to be expressed and understood by the right hemisphere. This makes it often possible to intuitively “know” whether person is lying. Semitrance involving entanglement between the right hemispheres of the communicators with some higher level self provides a mechanism might make possible this telepathy like emotional communication. Facial and bodily expression of emotion is probably not enough: autists perhaps lack the ability to fall in emotional semitrance. This would explain their ability to discriminate between faces and nonliving things. This hypothesis could be tested by comparing the EEG: s of autistic and healthy persons.

Trust is a crucial prerequisite of the survival of society and every human relationship. It requires something which might be regarded as partial regression to a child like state. Presumably it is this “regression”, the readiness to give up part of right brain consciousness, that makes semitrance possible. One example of semitrance is what happens in a group of good friends having good time together. The wittiness and rapidity of communications is something which is difficult to understand unless one is willing to accept that collective group self and group sub-selves are also participating the discussion through participants.

Semitrance mechanism is probably also involved in the communication of individuals: the self of a charismatic person is able to get “hypnotic” grasp about other people by semitrance mechanism. People who live long time together in close relationship (married couples) or those who have fallen in love, perhaps form “you+me” self rather stably. The claimed ability of close friends to communicate with each other non-verbally could also be based on “you+me” self. It is often said that in close relationships mutual trust makes if possible for partners to purposefully “regress” to childlike state which is prerequisite for semitrance. The state of falling in love is often indeed regarded as psychotic. That many of us lose their ability to fall in love when getting older, might be due to the lost ability to fall in childlike semitrance state anymore.

### Semitrance and childhood

“Ontogeny recapitulates phylogeny” principle suggests that the development of individual repeats the evolution of human consciousness and early childhood should correspond to the period during which child spends considerable fraction of time in semitrance with right brain hemisphere entangled with the collective consciousness formed by the parents and family. Childhood is indeed often regarded as the era of paradise. Rather interestingly, small children turn their head to the direction of music even when their attention is directed to mother [J17]. If music can induce semitrance one can understand the importance of lullabies. Many children develop non-existing playmates: perhaps the playmate is some higher level self.

It would not be surprising if collective self would talk to child with the voices of her mother and father and that child would experience mother and father as Goddess and God. This would explain the psychology behind God-father and Goddess-mother associations and also the very strong reactive attitudes towards religion, especially at young age. Interesting question relates to the fact that many children of modern age do not have mother and father gods.

What could be the signatures of the right brain semitrance state in case of a small child? If right brain is most of the time entangled with higher level selves and if right brain hemisphere is responsible for the holistic aspects of perception and cognition, children should not have holistic view about their own body. The drawings of young children are indeed more like collections of features, in particular, the holistic view about body should be lacking. The drawings of primitive man are similar. The coherence of the motions of left and right eye might serve as a measure for entangled-ness of right and left brain hemispheres: the eye motions of very young babies are indeed incoherent.

EEG emerges at the age of about year in frequency region 4-8 Hz stably. 8 Hz corresponds to the frequency defined by the duration of memetic codeword and smaller magnetic transition frequencies should be associated with emotions. Child gets EEG temporarily in lap of her mother already at the age of 6 months. At the age of one year child learns also her first words. It would be interesting to know what happens in the emotional development of a child at this age. In TGD framework also our sensory qualia involve in essential manner ELF frequencies in EEG range, our personal higher level selves. This would suggest that the consciousness of a very young child differs dramatically from that of adult: she sees but in an entirely different manner from the manner we

do.

### Semitrance and exceptional mental abilities

Schizophrenics are often capable of incredible feats of endurance: for instance, catatonics can keep same posture for days. Socrates is one of the best known example of a catatonic of this kind. Sacks tells in his book [J25] a fascinating story about his patient who was mentally retarded but could remember compositions of Bach and entire encyclopedia of music. Sacks tells also about idiot savant twins with intelligence quotient of 60 having amazing numerical abilities despite that they could not understand even the simplest mathematical concepts. For instance, twins “saw” that the number of matches scattered along floor was 111 and also “saw” the decomposition of integer to factors and primality. A mechanism explaining this based on the formation of wholes by quantum entanglement is proposed in [K73]. Indian self-taught number-theoretical genius Ramajunan told that he got his formulas from his personal God. These feats lose some of their mystery if higher level selves are involved.

### Music and semitrance

The basic difference between song and speech is that the pitch in song varies discontinuously whereas in speech it varies continuously in narrow region of about one fifth of octave (the interval  $C - E_b$  approximately). Rhythmic beat represents second basic difference. Music can stimulate emotions which we cannot even experience as a response to the events of everyday life.

In TGD framework speech and music could be seen as languages of thought and emotion. TGD predicts that memetic code [K37] realizes the language of cognition in terms of nerve pulse patterns of duration about .14 seconds in left hemisphere: this corresponds to frequency of about 7.1 Hz. Music in turn provides the language of emotion in which the relationships between frequencies and rhythmic elements express the content of emotion. The tempo of music could be closely related with the magnetic transition frequency associated with some “ELF self” involved. Typically the duration of single bar is about second and few pulses per second is the typical frequency of basic rhythmic pulses. Perhaps it is not accident that the range of frequencies in the EEG of young child is 4-8 Hz.

Right brain is the musical brain hemisphere. Anaesthetization of the left hemisphere in Wada test leads to a loss of speech but many patients can still sing. Also patients with haemorrhages on the left hemisphere can often express them singing. Even the removal of the entire left hemisphere can leave the ability to sing. Electrical stimulation of the right hemisphere produces hallucinations of singing and music. We react to speech dominantly with our left hemisphere whereas right hemisphere is activated more by music. For instance, if music is fed to both ears with the same intensity, the music fed in left ear is remembered and perceived better. Right hemisphere also distinguishes between melodies.

Many musicians seem to be more bicameral than average people in the sense that they spend more time in semitrance state. The ability to remember entire compositions could involve semitrance mechanism. Mozart could be perhaps seen as an example of a bicameral musician having miraculous music memory, hearing his compositions as wholes and behaving much like a child in this private life. Sacks tells in his book about a severely retarded man having miraculous ability to remember, understand and enjoy music pieces. This is consistent with the idea that emotional and cognitive intelligences are separate mental abilities.

One mysterious feature of music is that some compositions have ability to establish themselves as “classics”. If themes and compositions are emotional representations of memes, one could see classics as survivors in the memetic fight for survival. Music induces deep emotional experiences, also religious experiences, and surviving music pieces could be also seen as idols, pictures of “Gods”. I find it difficult to understand the deep affect of the pop music of my youth to my generation unless it expressed something essential about the collective mental landscape of that generation not expressible using only language.

### Poetry and semitrance

Modern poetry could perhaps be regarded as intermediate between thought and emotion: as a language using both words and elements of music to express ideas. Ancient poetry would in

turn be dictated in semitrance as God's voice. In his book [J17] Jaynes represents an analysis of ancient poetry relating it to music. Here only some comments about this analysis are made. Epics of Greeks by the aoidoi was heard and spoken as poetry. Also Veda was poetry dictated to Rishis or prophets and Hebrew prophets were often poets. Also schizophrenics often talk in verse. Translating Jaynes views to TGD framework, one can say that early poets were in right brain semitrance state which later developed to trance state (Plato regarded poetry as divine madness) and ultimately to the modern form in which poems were consciously composed in inspiration, which corresponds in TGD semitrance state to which the linguistic regions of both hemispheres participate. Note however that in TGD framework only the mode of communication changed from auditory hallucinations to cognitive and emotional communications.

Poems like music are rhythmical: perhaps the frequency involved with the beat corresponds to ELF frequency involved with the contact helping to "stay in touch with Muses". The basic rhythm of Greece poetry was dactylic hexameter. As in music the pitch varied discontinuously: basic unit being GCC. Constant pitch is used also in orthodox divine service. The role of rhyme is interesting. Syllables involve characteristic frequency distribution: since rhymes favor same vowels they favor also similar frequency distributions. This might lead to a resonance effect in which verses resonate with the mental images of the earlier verses reverberating in neural circuits and establish repetitive structures with repetition frequency defined by the duration of verse also favoring establishment of entanglement. Jaynes believes that first poems were sung and the use of music instrument helped to get the divine inspiration by stimulating semitrance state in the linguistic regions of the right brain hemisphere. Lullabies presumably have the same effect in child.

Jaynes sees ancient poetry as the emergence of long term memories at the level of individuals. Beautiful Muses, daughters of Mnemosyne, which later came to mean memory, singing in unison expressed stories about past whereas prophets told predictions for future. The transformation of the communications of the higher level selves from sensory hallucinations to thoughts and emotions could explain why modern poets do not receive their poems from Muses. What is fascinating that Muses appear in plural. This might be related to the ability of right brain hemisphere to represent musical instruments and voices as separate sub-selves whereas ordinary speech corresponds to single sub-self.

### **Semitrance and the development of human civilization**

TGD based vision about evolution of civilization modifies Jaynes's views. During evolution the profile of semitrance was changed: the voices of gods were transformed to abstract emotions and thoughts and the time spent in semitrance was shortened. Thoughts indeed merge spontaneously and are much more than reactions to sensory input: the great rise of mathematics and philosophy few centuries B.C. was dramatic example about transformation of the world of spirits, demons and gods to the world of abstract ideas. Also moods and emotions can be regarded as communications involving semitrance mechanism allowing to guide individuals in more delicate manner than just giving commands. Long term goals involve communication of this kind. The need of the collective selves to survive manifests itself as rules of behavior, moral. The notion of moral as a "voice of conscience" is consistent with the assumption that collective self expressed its will as auditory hallucinations for primitive man and with the idea that thoughts and emotions have replaced direct auditory hallucinations in this communication. TGD based model of sensory modalities explains thoughts as internal speech which is special case of auditory experiencing.

The tragic consequence of semitrance mechanism was the loss of face-to-face sensory contact with Gods. Celestialization of the visible Gods is the basic theme of Old Testament. Later Nietche announced the death of gods and postmodernism tells that also great narratives are dead. Conscious sensory "face-to-face" communication with collective consciousness, "God", occurs only during religious experiences and during dreams. In ancient societies dreams were indeed taken as messages of God and also nowadays many individuals do so.

There are all kinds of collective selves, also demon like creatures. It would not be surprising if demonic collective selves would not favor political leaders able and willing to listen to them in crisis situations. Jung proposed that a collective self which he called "Wotan" was behind the rise of Nazism. There are many stories about political leaders believing in dreams and omens and asking advice from crystal gazers. Many leaders have been schizophrenic personalities (Jeanne d'Arc,

Stalin, Hitler): it might be that just the ability to hear the voice of the collective consciousness gave them the self-confidences and charisma making them leaders. Needless to say, the examples of Stalin and Hitler show that the collective selves with intelligence of a stone-age village god are not sufficiently intelligent to lead modern nations.

## 5.3 Semitrance And Mental Disorders

Jaynes identified schizophrenic as a bicameral man in modern society and went to make a prediction that right brain contains hallucinatory regions. This prediction has been verified [J12, J11]. In TGD framework the picture of Jaynes generalizes to a more general vision about mental illness. It seems that semitrance mechanism might provide considerable insight into various types of mental abnormalities and one could perhaps regard various mental disorders as abnormalities in communication. Both semitrance communication between various levels of self hierarchy and communication between brain hemispheres are involved.

### 5.3.1 Schizophrenia And Semitrance

Jaynes's hypothesis that schizophrenic is a bicameral man living in modern society explains basic facts about schizophrenia. It is also consistent with the historical evidence: according to Jaynes [J17] schizophrenia was described for the first time as insanity at about 400 B.C. when modern subjectivity had established itself. As will be found Jaynes's hypothesis generalizes to TGD context in natural manner.

#### General wisdom about schizophrenia

Schizophrenics are extremely sensitive children before the breakup of illness. About 1 per cent of population suffers from schizophrenia, milder form of disease is schizotypal personality disorder suffered by 2-3 per cent of population. Neuroscientific approach to schizophrenia regards schizophrenia primarily as a disorder of cognition [J22] although it is also disorder of perception, emotion and social relationships. Kraepelin suggests that schizophrenia is basically a splitting of the cognitive side of the personality from the affective or emotional side: the correlation between emotional responses and real situation may be lacking: schizophrenic can laugh in situation in which he should cry. Schizophrenia resembles manic depressive disorder in that it involves negative (nonpsychotic) and positive (psychotic) periods. During the non-psychotic episodes symptoms, referred to as negative symptoms, are social isolation and withdrawal; odd behavior and ideas; neglect of personal hygiene; blunted affect. Psychotic episodes are characterized by what are called positive symptoms: loss of the reality testing; various hallucinations, in particular auditory hallucinations; delusions (aberrant beliefs); incoherent thinking; confusion. In paranoid schizophrenia megalomania and delusions of persecution dominate.

There is strong evidence that schizophrenia is partly genetic abnormality [J22]. Some schizophrenics have prominent anatomic changes in their brain. There is also evidence for physiological mechanisms. Antipsychotic drugs improve dramatically the treatment of the psychotic phase of illness. It is known that antipsychotic drugs block dopamine receptors and it was therefore thought that the excess of dopamine transmission is important factor in schizophrenia. It is also known that blood flow in the frontal lobes of schizophrenics is reduced and is not further enhanced during intellectual tasks [J22]. This is consistent with the interpretation of schizophrenia as a cognitive disorder. This has led to the suggestion that there is an increase in the activity of the mesolimbic component of the dopaminergic system and a reduction in the activity of the prefrontal area which accounts for the negative symptoms. It has however become clear that abnormalities in the dopaminergic transmission do not account for all aspects of schizophrenia. Although antipsychotic drugs occupy dopamine receptors very quickly, there is a delay of 1-2 weeks in the appearance of therapeutic effects. Thus it seems that antipsychotic effects are secondary to other consequences induced by the binding of the drugs to receptors. It is quite plausible that modifications of gene expression might be induced in cells responding to dopamine.

In TGD context Jaynes's hypothesis means roughly following.

1. The left brain hemisphere of the schizophrenic spends abnormally brief fraction of time in cognitive semitrance so that the cognitive self-narrative of the schizophrenic does not satisfy the requirements posed by the modern society relying on abstractions. Also the emotional self-narrative provided by the right brain hemisphere is poorer than normally. This explains reduced linguistic and cognitive abilities and emotional flatness.
2. The lack of proper cognitive and emotional self-narratives is compensated by a sensory self-narrative made possible by right brain semitrance and communicated to the left brain hemisphere as sensory hallucinations. This hypothesis explains the splitting of sensory field to part representing “real world” and the part communicated by collective consciousness to left hemisphere. During negative period schizophrenic the contact of the left brain of schizophrenic to “Gods” is split and schizophrenic experiences desperate alienation.
3. Compensation requires that the inhibition of the right hemisphere by the left hemisphere is weaker than normally. For a schizophrenic the left and right brain presumably de-entangle to higher degree than for a normal person. The reduced activity of frontal lobes and the increased activity of some parts of paleobrain are consistent with this hypothesis. Dopamine is one of the neurotransmitters responsible for the activity of brain regions and antipsychotic drugs indeed affect the abnormal dopamine levels. The abnormal dopamine levels are very probably related to the reduction of the inhibition of right brain hemisphere by left one.
4. Presumably the time fraction spent in right brain semitrance is higher and the average duration of the semitrance period is longer. Also the probability of right brain semitrance induced by stress is presumably higher than normally. This allows to understand why stress induces positive symptoms of schizophrenia so easily.

### More about symptoms of schizophrenia

Thoughts and emotions received from higher level selves and the sensory holism of the right brain hemisphere save the healthy person from the loss of “analog I” (using the term of Jaynes). In schizophrenia situation is different and the decay of personality and concrete loss of the boundaries of body, is one of the most terrifying experiences of a schizophrenic. The loss of “analog I” results from two mechanisms. First, the left brain of a schizophrenic fails to receive cognitive self-narrative about “I”. Secondly, during sensory semitrance right brain hemisphere does not provide a concrete sensory representation for the holistic aspects of body. The story of Oliver Sacks about Dr. P. [J25] illustrates in moving manner the notions of cognitive holism and the loss of sensory holism. Dr. P. had lost holistic visual consciousness due to a tumor in right occipital lobe and this led to rather amazing symptoms. Dr. P. elegantly characterizes glove as a “Geometric shape containing five elongated bags” but is not able to recognize the function of glove. Dr. P. also sees faces as mere collections of features. Music however provides Dr. P. with partial sensory holism: he is able to recognize persons through their “body music” and sings himself through the everyday activities like clothing and eating. Perhaps this is nothing but entanglement of right brain Wernicke area with higher level self.

Schizophrenics find it difficult to draw their bodies: this is used as a diagnostic test. This difficulty presumably reflects both the decay of the cognitive self picture formed by left brain and the loss of the right brained sensory model of self caused by abnormally long periods of entanglement with higher level selves. Eye motions of schizophrenics are also abnormal: the coherence of motions of right and left eye is not so good as in case of a healthy person. It might be that this is partly due to the semitrance of the regions of right brain controlling eye motions.

The breakdown of the personal narrative reflecting itself also as a loss of personal time is also regarded as a symptom of schizophrenia. If personal narrative is told by higher level selves to person using basically language and if schizophrenia is cognitive disorder, it is not a wonder that this narrative breaks down and in worst situations leads to the loss of self.

Voices and other sensory hallucinations can be interpreted as resulting from the semitrance of right brain sensory regions. Voices can be malevolent and persecuting as to drive schizophrenic to flee or attack some-one. Voices can also act as benevolent guides in the daily activities of the schizophrenic. Voices can even induce religious ecstasy. TGD suggest that the higher level selves talking which these voices are indeed malevolent or benevolent as also human beings are. An open

question is whether the patient could to some degree decide with which selves to entangle. This might be the case: suggestions by authorities can affect very dramatically the hallucinations and even eliminate them [J17]. Of course, the experience about the malevolence or benevolence of the voice might be due to cognitive disorder of patient.

The megalomania of the paranoid schizophrenic is probably related to the experience of being a selected messenger hearing God's voice. This interpretation is with that prophets seem to also have been persons able to directly hear God's voice. The experience of a paranoid schizophrenic about being persecuted need not be a mere hallucination. Social games are played all the time in modern society. This leads schizophrenic to an extremely stressing situation: schizophrenic hears the authoritative voices of the collective group self telling the truth and the conflicting messages told by human mouths. The painful and stressing nature of social communications explains also why social isolation is one of the symptoms of schizophrenia and why schizophrenics are so suspicious. This leads to isolation and behavior promoting isolation such as neglect of personal hygiene: negative symptoms result from the avoidance of social stress inducing positive symptoms. Normal person receives the messages of the collective selves as thoughts and emotions which are not so authoritative and in conflicting situations they can be blamed to be only reckless imagination. Suicide is extreme example of the authority of the voices: it would be perhaps better to say that person does not perform suicide but is murdered.

Automatisms are one important aspect of schizophrenia. Schizophrenic cannot resist the authority of the voice telling him to do things which he would not do normally. The emotional state of the schizophrenic need not be consistent with what he is doing: schizophrenic can dance or sing without being happy or can laugh when he is unhappy. This suggests that also the communication of emotions fails. Command automatisms are one example of automatisms. Patient is very apt to suggestions of authority and can remain in in some posture for hours if physician suggests this. This might be due to a hypnotic suggestion involving direct entanglement with the brain of authority. Also completely unconscious automatisms are possible and can be understood as activities not involving the mediation of the left brain hemisphere. For instance, patient may feel that someone else is moving his tongue or cannot stop his mouth from singing. In the framework of TGD patient is indeed "half-possessed" by the demon like higher level self. Echolalia is one of the most amazing schizophrenia like disorders: patient can mimic the speech, facial expressions and gestures of other persons like automaton. Semitrance involving entanglement of motor regions of the right brain hemisphere with the brain of another person explains this. Also hallucinatory echolalia in which one cannot identify higher authority as any known person is possible.

Flattening of affect and loss of emotions occurs also often during both the positive and negative periods of schizophrenia. This is consistent with the hypothesis that higher level selves communicate with schizophrenic via sensory hallucinations rather than thoughts and emotions.

### About neurophysiological signatures of schizophrenia

[J17] [J17] mentions also several signatures of schizophrenia related to EEG, brain anatomy and neurochemistry. These signatures are consistent with the assumption that schizophrenic is more sensitive to semitrance induced by stress; that the fraction of time spent in semitrance is higher than in case of normal person and that the profile of semitrance communications favors sensory experience instead of cognition and emotion.

1. The average EEG is slightly more intense in the left brain hemisphere of a healthy person whereas for schizophrenic the roles of left and right brain are changed. As already noticed, TGD based approach predicts that standing EEG waves make possible entanglement with higher level selves. Thus the assumption that EEG dominance correlates with the presence of standing EEG waves making possible the entanglement with higher level selves, explains this asymmetry.
2. Sensory deprivation increases dramatically and rapidly EEG activity. The effect of sensory deprivation is easy to understand: in case of a schizophrenic right and left hemispheres are more loosely entangled than in case of healthy person: during unentangled state right brain hemisphere or parts of it fall asleep when so that semitrance and hallucinations result. Healthy person simply gets drowsy and falls even asleep in the absence of sensory stimuli.

3. The EEG of a healthy person exhibits slight right or left brain dominance with a period about one minute: in case of a schizophrenic this period is about four minutes. EEG seems to stuck in left/right mode. This means that the probability of the right brain hemisphere to fall asleep during the 4 minute period of intensified EEG is high so that sensory semitrance can result. The longer period might be an attempt to enhance the reduced probability to fall in cognitive left brain hemisphere semitrance in order to save cognitive self-narrative. The longer period however implies higher probability for the schizophrenic to fall in sensory semitrance during the psychotic period of the disease.

This can be understood more quantitatively as follows. The simplest assumption is that the probability of the hemisphere to “fall asleep” during time interval  $\Delta t$  is  $dp = \lambda \Delta t$ , where constant. The probability to fall in semitrance in interval  $(t, t + dt)$  is

$$dP = (1 - P(t))\lambda dt \text{ ,}$$

which gives for the probability of not falling in semitrance during interval  $t$  of enhanced EEG activity

$$P = \exp(-\lambda t)$$

For schizophrenic the probability  $P_s$  to not suffer hallucination is

$$P_s = P_h^4 \text{ ,}$$

where  $P_h$  is corresponding probability for healthy person. In case of a schizophrenic  $\lambda$  is anomalously small for the left brain hemisphere but could have normal value for the right hemisphere. Already this simple model gives a rough quantitative grasp about difference of healthy and schizophrenic person.

In his book Jaynes made the hypothesis that the linguistic regions of right brain are the hallucinatory regions of schizophrenic. It has been found that neural activity in various parts of right hemisphere increases during the auditory hallucinations of schizophrenic [J12, J11]. This would suggest that also other regions of the right hemisphere are involved with hallucinations. TGD indeed suggests that in case of schizophrenic also other than linguistic regions are in semitrance.

The bundles of axons in corpus callosum connecting right and left brain are by 1 mm thicker for schizophrenic than for healthy person. This suggests more intense sensory communication from the right hemisphere to the left hemisphere favoring the generation of sensory hallucinations. Note that auditory hallucinations are presumably associated with the anterior commissure connecting Wernicke area to its counterpart in right brain hemisphere.

### What good in schizophrenia?

Defectological view sees schizophrenia as a collection of defects whereas evolutionary psychology sees schizophrenic as an inhabitant of wrong time and place. Schizophrenics differ from ordinary people in several aspects helping adaptation to more primitive society. Schizophrenics have much more livelier perceptive landscape than the normal ones. For instance, visual perception is known to be sharper. The blocking of alpha waves as a reaction to sudden sensory stimuli occurs faster than in healthy persons. Schizophrenics can work hardly for much longer times and are able to tremendous feats of endurance. Catatonia is one example: schizophrenic can spend days in a posture which normal person could not tolerate more than a minute. All kinds of explanations for the ability of ancient men to build pyramids and other architectonic miracles have been proposed but the incredible endurance of bicameral men is the most plausible explanation. These feats do not reflect endurance of an ordinary human being but of a higher level self using schizophrenic as instrument.

### Nature or nurture?, possible cures?

Schizophrenia seems to be both genetic disease and disease of self-organization of brain. Self-organization aspect makes schizophrenia a genuine quantum disease (or abnormality). Schizophre-

nia can be seen as the failure of the left brain hemisphere of a schizophrenic to cognitively self-organize to the level achieved by normal persons. More concretely, the de-entanglement of the sensory regions of the brain hemispheres occurs too easily and is followed by the trance of the corresponding right brain regions. Also the profile of the semitrance communications is abnormal. This defect could be associated with some aspects of personality only and they could be perhaps characterized by effective cognitive ages with various types deducible from EEG pattern of the patient. If self-organization aspect dominates over genetic factors, suitable external stimuli could perhaps make possible healthy self-organization. The symptoms of schizophrenia appear at the verge of the adult age which suggests that schizophrenia is to high degree this kind of disorder.

If self-organization aspect dominates and schizophrenia is inability to achieve full cognitive age, the EEG of children should have some (not necessarily all) characteristics of a schizophrenic person. One could check whether the above listed EEG signatures characterize also the EEG of children. Especially interesting in this respect is the 8 minute period of schizophrenic EEG as compared to the 2 minute period of a healthy persons making the probability of the semitrance state high.

One could imagine the elimination of the positive symptoms of the schizophrenia by electrically stimulating appropriate regions of patient's brain using electric implants to make falling to semitrance less probable and to reduce the fraction of time spent in semitrance nearer to its normal value. The total elimination of semitrance would however transform positive symptoms to negative ones and would split the communication with higher level selves, which seems to be essential for the self-narrative. Also the inhibition of the right left brain communication is one manner to eliminate hallucinations and presumably the effect of antipsychotics is based on this inhibition. One could however consider possibility of inducing left brain hemisphere semitrance to improve cognitive communications with higher level selves.

Social isolation of the schizophrenic is presumably due to the contradictory messages received by semitrance mechanism and via externalized communications. Therefore schizophrenic might be completely happy in the social environment where this discrepancy is absent. Thus genuine love, respect and acceptance are perhaps the most effective manner to reduce the sufferings of the schizophrenic.

### **Tourette's syndrome**

Tourette's syndrome is a mental disorder having close resemblances with schizophrenia and it seems that the reduction of the entanglement between the speech regions of right and left brain hemispheres could explain this. It is not however obvious whether entanglement with higher level selves is involved or not. For a description of Tourette's syndrome reader the books of Jaynes [J17] is recommended. Sacks tells in his "Man who mistook his wife for a hat" tells also a story about Tourette's syndrome.

Tourette's syndrome usually shows its first symptoms in childhood at the age of five or sometimes earlier. In the beginning the symptoms are mild: facial twitch or bad word out of context. This develop to uncontrollable emission of obscenities, grunts, barks, or profanities in the middle of otherwise normal speech. Tourettians are extremely "sensory": they love to feel things by touching and even by tasting them. They have ticking like appearance and are enormously spontaneous in their behavior. Tourettians are often artistically gifted. Tourettians can cope in society due to modern medication. They are fully conscious of their state and have bivalent attitude to their state: they suffer from it but feel that they would lose something valuable in normal state of mind. Sacks tells about a Tourettian how resolved the problem by coming weekend Tourettian living ordinary life during working days! Tourette's syndrome involves abnormal brain wave patterns, some central nervous system damage, and usually left handedness.

The symptoms of Tourette's syndrome bring into mind a continual fight between two personalities: the second personality intrudes continuously to the activities of the dominating personality. This situation resembles split brain personality to that occurring when the physical connection between brain hemispheres is cut. Perhaps some regions of left hemisphere have abnormally weak entanglement with the corresponding regions of the left hemisphere so that right and left hemisphere are competing for the usage of speech organs. It is not clear whether semitrance mechanism could be involved so that Tourettian would be "semi-possessed".

### 5.3.2 Disorders Of Mood

In neuropsychology one distinguishes between moods and affective responses [J22]. Moods are long lasting emotional states whereas affective responses are direct emotional reactions. Euphoria, elation, pleasure, surprise, anger, anxiety, disappointment, grief, sadness, despair, depression are normal affective responses. In disorders of mood three of these responses become abnormally strong: euphoria (manic disorder), depression and anxiety.

One can distinguish between unipolar depression and bipolar depression (manic-depressive disorder). Unipolar depression can be reactive, endogenous or atypical(!). In endogenous case (melancholy) symptoms are depression with diurnal variations (mornings are especially difficult), insomnia and frequent awakenings with early morning wakening, anorexia, psychomotor agitation and mental pain, loss of interest to almost all activity and lack of response to pleasurable stimuli (ahedonia). Endogenous depression does not lead to emotional or intellectual under-activity. Reactive depression results from a specific stress, like loss of job, family member, etc... and is not so pervasive as endogenous depression. Maniac "suffers" from euphoric periods. Elevated, expansive or irritable mood lasting at least one week, over-activity, over-talkativeness (or hypergrafia), social intrusiveness, increased energy and libido, pressure of ideas, grandiosity, decreased need for sleep, reckless involvements. Perhaps manic-depressive and creative person differ in that creative person has some well defined long term goal to which he/she can direct this immense energy.

The key feature of the panic disorders is fear: arousal, restlessness, heightened responsiveness, sweating, racing heart, increased blood pressure, dry mouth, a desire to run or escape, and avoidance behavior. There are two basic types of anxiety disorder. Panic attacks are brief, recurrent, spontaneous episodes of terror without any clearly identifiable cause. Generalized anxiety is long lasting (lasting for six months or longer). The symptoms are motor tension, autonomic hyperactivity, vigilance and scanning (feeling on edge, exaggerated startle response, difficulty in concentrating).

Reductionistic neuroscientists seem to forget social factors in attempts to understand mental disorders. They cannot but agree that reactive depression correlates with a personal loss but do not mention social factors in case of melancholy. The natural guess would however be that melancholy differs from reactive depression in that it correlates with long lasting stress such as loneliness or some unachieved long term goal. Of course, melancholy in turn favors the continuation of this situation. One could also wonder whether it is really sensible to talk about disorder of mood when mood actually reflects very faithfully the actual social situation. It is known that genetic factors are important in various forms of depressions. But again, genetic factors could help to build an individual whose fate is to question for the values and beliefs of the community and the hostile reaction of the community could be the primary cause of depression and even physiological changes.

### 5.3.3 Mental Disease As Communication Disorder?

TGD suggests modification of the standard views about mental disorders. Basic principle in biochemistry and control and coordination of living matter is dynamic equilibrium in which inhibitory and excitatory effects cancel each other in equilibrium: a good example of this principle at work is the process of standing still. There is abundant evidence that the structures of the left and right hemisphere have inhibiting effects on each other: there is a temptation to regard this inhibition as a particular example of a general principle. The mutual inhibition could also be seen as a mechanism guaranteeing division of labor: symmetric functioning leading to redundancy is not possible. The failure of the mutual inhibition could be seen as a general mechanism of mental illness so that the metaphor of mental balance would be much more than metaphor. Standard neuroscience favors this view.

TGD suggests however a different view. One could also see mental illness as a failure of communication between brain hemispheres and higher level selves. Messages of higher level selves could be simply misunderstood or not received at all. For instance, the communication of emotions could be inconsistent with communication of subjective and geometric memories whose comparison should determine the emotions. In this picture the sensory hallucinations of a schizophrenic and prolonged periods of hemisphere dominance could be seen as an attempt to compensate the poor cognitive semitrance communications of the left hemisphere with higher level selves. The lack of the right brain inhibition by left brain indeed allows right brain hemisphere to communicate the

messages of the collective consciousness to the left hemisphere.

Empirical facts about lesions of brain make it possible to test the idea about mental disease as a disorder of communications. When temporal lobe epilepsy is caused by a lesion of the left temporal lobe, 90 per cent of patients develop the symptoms of paranoid schizophrenia with massive auditory hallucinations. If the lesion is on the right temporal lobe, patients tend to develop manic-depressive symptoms. This suggests that schizophrenia and manic-depressive disorder are mirror images of each other. Indeed, negative and positive symptoms of schizophrenia correspond to the depressive and manic periods of manic-depressive psychosis. Schizophrenia and manic-depressive psychosis are indeed somehow dual: the positive period of schizophrenia is more like passive experiencing of hallucinations whereas the manic period of manic-depressive psychosis involves over-activity and the lack of emotional guidance leading to reckless involvements. This could be understood if left brain is passive thinker and right brain is active decision maker. In absence of the guidance of the higher level selves patient behaves abnormally. This duality supports the view that both brain hemispheres of a healthy person participate to semitrance communications. Complete symmetry would suggest that also left-to-right lobe communications are possible. In case of manic-depressive disorder these communications should occur during the manic period of disease and should be suppressed during the depressive period.

In this conceptual framework one could understand why both schizophrenia, manic depressive disorder and anxiety disorder have two different manifestations and semitrance mechanism suggests a unified view about these disorders.

1. Defects of left (schizophrenia) or right (manic depressive disease, anxiety disorder) brain semitrance communications are the basic characteristic of these diseases. Brain tries to compensate the lacking communications: the opposite healthy brain hemisphere is still capable of effective semitrance communications and tries to help the opposite hemisphere by communicating it the guidance it receives from higher level selves. Unfortunately, this compensation is not complete and is present only during active period of disease and lacks during the passive period.
2. The fraction of time spent by the healthy hemisphere in semitrance involving communications with opposite hemisphere, call it briefly  $\tau$ , could be an important parameter measuring the character of illness in all these three cases. During the passive period (period of negative symptoms in schizophrenia/depression/panic disorder)  $\tau$  is abnormally low and patient is like a rejected child and in the absence of telepathic guidance and encouragement patient finds social contacts difficult and tends to withdraw from social interaction. During active periods (positive symptoms/manic period/general anxiety disorder)  $\tau$  is abnormally high giving rise to the sensory hallucinations of the schizophrenic and to the euphoria and social intrusiveness of the person suffering manic disorder. In case of the anxiety disorder even the presence of left-to-right brain communication is unable to save patient from the general anxiety disorder, which gets even worse in the absence of this communication.

## 5.4 Semitrance, Trance And Altered States Of Consciousness

It seems that semitrance mechanism could also provide understanding about various altered states of consciousness. In some cases it is difficult to draw a borderline between trance and semitrance and therefore also trance like states are discussed in the following.

### 5.4.1 Sleep, Trance And Dreams

Sleep and trance are unconscious states from the point of view of individual although higher level self is certainly conscious. The distinction between sleep and trance provides an interesting challenge for quantum theories of consciousness. During trance state entire brain is strongly entangled and human body serves effectively as organ of the higher level self. Concerning the interpretation of the sleep state, the first hint comes from the observation that the wake-up from sleep occurs much more easily than from trance state. This suggests that entanglement is now

weak and near to the critical value. There is also evidence for some kind of information processing occurring in brain during sleep state.

Quantum computing have been suggested as a metaphor for the information processing performed by brain. The information processing performed by a quantum computer is unconscious in TGD framework and in case of an ideal quantum computer occurs just at the border of conscious and unconscious state so that entanglement is as weak as it can be. This would suggest that quantum computing like activities indeed occur during sleep. Of course, quantum computing in the strict sense of the word is probably too restricted a notion to be applied in case of biological structures. It might be however that the unconscious information processing by brain known believed to occur during sleep is analogous to quantum computing.

Trance states involve the entanglement of entire brain with higher level self. The claimed ability of mediums to communicate with dead and induce aspirations of dead relatives could be based on ability of the medium to entangle with the collective consciousness of the participants of the sitting as well as to induce semitrance in the participants. The semitrance of the participants is also essential for the formation of the collective self. Sleepwalking probably also represents a trance state in which sleeper serves as a motor organ of the collective self. The many variants of religious possession, such as talking with languages, could be regarded as trance states. Shamanism and oracles represent also examples of trance states. In this case trance state is induced artificially.

Hypnosis presumably involves the entanglement of the hypnotizer with part of subject person's brain which thus becomes part of the hypnotizer. Swinging pendulum is a classical auxiliary tool used to induce hypnosis. Perhaps the rhythm of the swinging pendulum corresponds to a relevant EEG frequency associated with the collective self formed by the hypnotizer and subject person. Concentrating attention to the pendulum might induce semitrance (at least it causes dizziness). The attention of the subject person is concentrated to the pendulum and to the voice of hypnotizer and the scope of consciousness is gradually reduced. It is not clear whether the final state is semitrance or total trance. Semitrance option is consistent with the fact that schizophrenics are very apt to suggestions.

During dreams only part of brain is conscious and this in principle makes possible communications from those parts of brain which are in semitrance. Of course, it is quite possible that brain generates the dreams itself. Both dreams dominated by auditory and visual experiences and dreams consisting of internal speech are possible. Dreams are often passive (lucid dreams are an exception) which would suggest that sensory semitrance mechanism involving either or both hemispheres is indeed involved. This of course does not exclude the possibility of active generation of hallucinations as occurs during lucid dreaming. Communication (generating mental images/waking up sub-selves in receiver) can be also bi-directional. Even fetus seems to have periods of REM sleep. An interesting question is whether it possesses EEG like activity at higher frequencies say 60-70 Hz associated with REM dream. If so, our dreaming state would be much like return to prenatal consciousness involving semitrance with sensory hallucinations. Ordinary state of consciousness could quite well involve also very short intervals of trance during which higher level selves communicate with entire brain but unconsciously. An interesting question relates to how much the EEG profile in REM sleep (average EEG frequency is 65 Hz) resembles the profile associated with the visual and auditory hallucinations of schizophrenics. Interestingly, many (not all) schizophrenics spend abnormally short time in REM sleep. Perhaps the total time spend in semitrance is what matters.

## 5.4.2 Altered States Of Consciousness

### Religious and similar experiences

Various religious experiences are excellent candidates for semitrance states and could correspond to the entanglement with the highest levels of the self hierarchy possible for human. Persinger's work [J23] related to the effects of ELF em fields to brain provides support for the notion that topological field quanta of ELF em fields are correlates of the higher level selves. Stimulation of the right hemisphere using various patterns of magnetic pulses of duration of about millisecond with frequency between 1 and 50 Hz generates various kinds of altered states of consciousness. The basic experience is sensing the presence of something which can be benevolent or malevolent. Obviously this something must inform subject person about its presence via semitrance mechanism. Seeing

angels are typical religious experiences and have obvious explanation as right brain semitrance.

Persinger explains UFO experiences as modern versions of religious experience allowed by the non-religious culture we live in [J23]. This is what also TGD predicts: it is left brain which interprets the messages of higher level self using the available belief system and conceptual framework. Persinger's view is materialistic: he sees religious experiences as mere neural activity coupled with geo-electromagnetic fields. Also changes in Earth's magnetic often induce altered states of consciousness and there is strong statistical evidence about the effects of the magnetic storms on the well being of the patients of the mental hospitals. These effects are consistent with semitrance hypothesis and the hypothesis that magnetic and  $Z^0$  magnetic transition frequencies provide spectroscopy of consciousness [K35]. Note however that the endogenous magnetic field  $B_{end} = 2B_E/5 = .2$  Gauss explaining various findings about ELF effects on brain is not identical with the Earth's magnetic field  $B_E$  and could be interpreted as "dark" magnetic field accompanying it [K30]. Experiences in which person meets deceased relatives can be produced with highly reliable methods [J2]. Semitrance mechanism provides explanation for these experience and suggests that some levels of personal electromagnetic self hierarchy survive in "physical" death.

There are also experiences not identifiable as semitrance experiences. For instance, meditative experiences in which mind is totally empty belong to this class of experiences. TGD based explanation of these states as states of "whole-body consciousness" relies on the notion of irreducible self having by definition no sub-selves (mental images). These kind of states presumably involve mutual entanglement of the left and right hemispheres. One could say that irreducible selves are for consciousness what elementary particles are for physics.

### Telepathy, clairvoyance and identification experiences

In [K68] I have considered the explanation of phenomena like telepathy, clairvoyance and group consciousness. These experiences can be explained in terms of semitrance mechanism involving entanglement with ELF selves assuming that rather abstract concepts exist physically as higher level selves as TGD indeed predicts.

Especially fascinating are identification experiences [J30] [K68]. The objects with which person can identify range from elementary particle, via objects of inorganic and organic world (like animals, the mothers of all dead soldiers, etc..) to entire Cosmos. It is not obvious whether a mere semitrance is sufficient to explain identification experiences. TGD provides a more general mechanism making possible transpersonal consciousness. For definiteness assume that right brain hemisphere is in trance state and that left brain experiences a phase transition increasing the p-adic prime characterizing it so that this prime becomes larger than equal to the p-adic prime characterizing higher level self entangled with the right hemisphere. In this kind of situation remembered extended state of consciousness results if left brain hemisphere entangles with the latter system. Various religious and enlightenment experiences could perhaps be understood as examples of this kind of experience. In particular, Brahman=Atman experience in which person identifies herself with God, following semitrance experience about direct personal contact with God, could represent this kind of experience.

Perhaps enlightenment can be identified with what might be called "loving state". "Loving state" involves extension of self and should therefore make possible to affect the state of other living beings by semitrance mechanism. TGD predicts that DNA can be in self state and its binary structure suggests the possibility of semitrance states. There is empirical evidence that people in "loving state" can affect the degree of winding of DNA [I38]. The coherence of ECG is used in these experiments as a measure for how deep the "loving state" is and the degree of the winding of DNA correlates with the intention to wind (unwind) DNA.

### 5.4.3 Stephan's Case

"Stephan's case" was one of the stimuli which made me conscious about the challenge of formulating precisely how different levels of the self hierarchy can communicate with each other. I learned about Stephan's case via email correspondence with Stephan's mother. Stephan was a victim of brain injury and his survival was regarded by several specialists as a "miracle" from the viewpoint of standard medicine. There were also some other miracle like occurrences during the period after accident and they could perhaps be interpreted in terms of trance and semitrance

states. In the sequel Stephan's case is discussed as a possible example of entanglement with higher level selves involving trance and semitrance mechanisms.

I hasten to admit that my personal knowledge about practical medicine is very restricted and that I must therefore stay at general level in my interpretations. Second reservation: these interpretations are the first attempt to apply TGD inspired theory of consciousness to individual person and must therefore be taken with grain of salt. I learned from Stephan's case from Stephan's mother who contacted with me and asked whether TGD approach to consciousness could say something about Stephan's case. In the following I will use excerpts from the correspondence with Stephan's mother to describe what happened.

There is additional aspect related to Stephan's case about which I became conscious only when trying to learn about body consciousness. This aspect is related genetic engineering involving unholy alliance of science and business. To learn what is really involved, it is good to read Mae-Wan Ho's article about the dangers of genetic genetic engineering [I32]. The most hard-nosed genetic engineers are ready to build headless humans to provide store parts for the more lucky ones. The justification for this comes from the basic dogma of neuroscience. No brain, no consciousness. I feel horror when trying to image what it is to be a conscious human without head and losing gradually organs. Limb to day, liver tomorrow, next week heart, and so on. What does this helpless living creature experience?

### **What happened?**

In the following is the report of Stephan's mother about the accident.

#### **Accident**

Stephan had just turned 21 and was travelling with a friend to see his grandparents in Oklahoma. They got as far as a State Park campground outside of New Orleans. The vehicle Stephan's friend was driving clipped a wooden sign too close to the narrow park road, which catapulted the side-view mirror assembly into the passenger window. It hit Stephan over the left eye, bounced and hit him at least 2 more times, and shattered his face and skull into more than 100 pieces. Displacement of bone fragments dissected the left internal carotid artery, caused 2 pseudoaneurysms in the left middle meningeal artery, and shear injury caused formation of a carotico-cavernous fistula where the vessel tunnels through the base of the skull.

Records state that first aid was rendered by an elderly priest who was walking near the accident scene, and who used to be a physician. He applied pressure to the left external carotid until blood flow stopped, but by then Stephan had asperated 2 lungful. He was basically drowned. At the hospital they managed to pump out his lungs and hook him to a respirator, transferred him to Intensive Care. We were given no hope that he would survive, but it had been noted on his driver's license that he was an organ donor, so they said they'd keep him alive until we got there if they could.

We drove all night from Florida to arrive the next morning. He was still alive, hooked up to the machinery, his head swollen beyond belief. We were told he had a CSF leak down his throat from a shattered palate, that there wasn't any sense in shunting the pressure from swelling because he'd been more than 20 minutes without oxygen due to drowning in blood. They wanted his organs. Had he actually been dead, we would have donated them. He was not.

When I saw him he was "asleep", but I noticed serious restraints on his chest, arms and legs. He stirred once, tried to move, and moaned. I asked the neurosurgeon why he was restrained, and was told he was "very combative." This made no sense to me given the injuries. I was asked what kind of "drugs" he was on to make him so strong. I was told he had floored 2 male nurses that morning transferring him to CT scan room, and that he'd tried to "escape".

My husband and I recognized immediately what was happening, and also recognized that he was most certainly not "brain dead" and was not nearly as "unconscious" as the medical people said he was.

#### **About Stephan**

We had known our son well for all 21 years of his life. What we knew about him was that he had a most unusual consciousness. He had always been an active dreamer and notorious sleepwalker. This dream-self (unconscious?) had a distinct personality that was Stephan but was also not-Stephan. His normal waking personality was quiet, shy, very thoughtful and sweet. Brilliant in a number of ways and immensely talented, harmless. He'd learned to juggle when he was 12, and could juggle 5 objects of different size and shape (including fire) under his leg, behind his back, over the top and every other way you could think of, and make it look easy.

He became a professional clown - partner to my husband - and started working with young children. They loved him like crazy. He had his own television show, a fan club full of 6-year olds, and appeared in some motion pictures as a teen heartthrob.

His unconscious self, the sleepwalker, was his "dark side" (like the "shadow" in psychology). With Stephan, he was such a good-guy that even his shadow was a good-guy. Just different. Instead of all sweetness and light like SkyPup the Clown, the sleepwalker was Batman (that's what we called him). Serious, brooding, very intense and "haunted." An undercover super hero fighting forces of evil for the good of humanity, always at the ready.

Stephan began to "grow out of" active dreaming when he was 13. He was a target of bullies at school because he was smaller than the other children, but he was tremendously coordinated. We got him martial arts lessons, and he quickly earned his belts. He was a master of weapons - bow, chucks, swords - and paid for extended lessons by appearing in public with the master of the art. He became so proficient we thought he'd finally integrated both "sides" of his personality by the time he was 16.

### **Stephan after accident**

When we heard about his strange (and unexplainable) activities following the accident, we realized Batman was back, fully in control, and in that situation extremely dangerous. Our visits in ICU were limited to 10 minutes every 4 hours, but I went to work right away communicating with Batman in the way I had always done. He responded. After 3 days, when he opened his eyes and I managed to talk the doctor into removing the ventilator, he was talking back to me. The medics judged him "conscious" and allowed me to stay with him in ICU so he wouldn't fight the attendants.

By day 3 the swelling had gone down to normal except for a bump over the left eye. The displaced pieces of shattered bone had reset themselves without disfigurement, and there was no bruising. The hard palate, which 3 days before had been "a mushy mess of moveable bone" according to the doctor, had reset and become "rigid". Stephan was eating solid food, walking with my help to the restroom, and had begun to count out loud. He'd count until he got to where a number was missed, I'd tell him what it was, then he'd start over. This went on until he got to 1000. I believe he was checking his brain circuits for damage.

The CT scans demonstrated a resolving left frontal lobe contusion as the only physical brain injury apparent. He was still severely confused and child-like in his speech, but there were no physical deficits, he was extremely strong (and remained in restraints when I wasn't there), and the long period without oxygen did not appear to have damaged his circuits. The doctors had no explanation at all, just shook their heads and said they'd never seen anything like it. It was a Catholic hospital, the priest who saved Stephan's life called his contacts, and investigators from the Vatican arrived. All involved were absolutely convinced it was a genuine "Miracle".

Stephan was released from the New Orleans hospital 10 days after the accident and I flew with him in an Air Ambulance back home to Florida. There he went into the care of a neurologist at a facility attached to a large rehabilitation hospital. At that time rehabilitation looked like it would be necessary.

The neurologist called in a full team, including 3 neurosurgeons, to document this supposed "Miracle". They ordered an MRI scan, which showed the dissected carotid and aneurysms as well as the cc fistula. They were suddenly very, very confused. Stephan's actual condition absolutely did not match what the MRI showed, so they wanted to see the blood flow. They ordered an arteriogram, which is an invasive

procedure.

The arteriogram confirmed the compromised arteries on the left side of Stephan's brain. Medical knowledge "knows" that this would have resulted in paralysis of the right side of the body, but Stephan was by that time juggling oranges in his hospital room and playing chess with his cousin. The radiologist pointed out recently in court that Stephan had an uncommon but not unheard-of anomaly of brain form and plumbing supply. The hemispheres of his brain were not separated in portions, and he had a double-entry blood system which resulted in cross-flow from the right carotid to the left (and presumably *visa versa* had the left supply been working). This anomalous blood supply was postulated to account for the lack of paralysis and infarct damage.

Unfortunately, the invasive arteriogram procedure caused a complication to develop - hemorrhage of the cc fistula, which presented as massive epistaxis (nosebleed). We did not connect the two, because the doctors told us the hemorrhaging was not related to the diagnosed artery injuries, but were instead the result of broken nasal bones. I believe they were frightened that their test had caused the condition to deteriorate, and they decided not to do anything about it. So they lied.

Every day we would spend more and more time with Stephan's normal conscious personality. Batman had appeared for survival purposes, and was allowing Stephan to be conscious for periods of time until he became tired. We knew both of these personalities well, could deal with either or both of them, so we stayed in the hospital room with our son. We even became fairly adept at emergency response to serious hemorrhages... because we had to.

Stephan was sent home without treatment for the arterial injuries, which we were told not to worry about. Three weeks later he suffered 2 more massive hemorrhages and was hospitalized in the care of a facial surgeon. He received cauterization surgery in the nose, blood transfusions, and was again sent home. Three weeks later he suffered yet another hemorrhage which could not be stopped, and died.

Medically, there was absolutely no reason for Stephan to have been alive at all. Medically there was no accounting for his consciousness or physical strength. 2 teams of a dozen doctors in 2 states have testified on the record and in a court of law that this was a "Miracle".

I saw it differently. The "Batman" sleepwalker who took over when Stephan was rendered unconscious did not recognize or heed physical damage to the Central Processor (brain). I think this consciousness operated quite differently than the normal waking consciousness, perhaps directly through the cellular consciousness of body. I do not know where Batman's processor was, but it may be seated entirely on the undamaged right side of the brain. He was able to speak, write poetry, play chess and guitar, so was obviously using left side circuitry to some extent, or perhaps this personality was associated with a "higher self" consciousness that operates non-physically.

#### **The general hypothesis explaining medical miracles**

The foregoing suggests that there were several medical "miracles" involved. A possible general explanation for these miracles is the entanglement of parts of brain with some higher level self leading to either trance or semitrance state.

1. Negentropy Maximization Principle (NMP) tells which subsystem of self gets opportunity to perform quantum jumps. If the injured parts of Stephan's brain entangled with higher level self and did not get this opportunity, they did not suffer irreversible, incurable changes. Therefore the miracle became possible.
2. This was certainly the case if the higher level self enjoyed whole-body consciousness, which by definition does not allow sub-selves. This condition is however un-necessarily restrictive: it is enough to assume that the injured parts of Stephan's brain did not win the race about the maximization of negentropy gain via quantum jump leading to unentangled state.
3. The reduced blood flow in brain might have been an important factor: the reduction of the blood flow led to a reduced entanglement entropy flow into left brain half and this meant

that these parts of brain did not have chances to win the race for making a quantum jump to unentangled state.

Thus the basic hypothesis is that entanglement with some higher self occurred and this self consciously saved Stephan's life. Using religious terminology: Angel saved Stephan. The hypothesis is very natural in light of the proposed role of higher level selves in the self-organization of human civilization. Bicameral man received commands and advices of collective consciousness(es) in semitrance state [K75]. In fact, the concrete guidance of humans by higher level selves via semitrance mechanism provides a natural explanation for the beliefs about angel like beings guiding the behavior of mortals. It is quite possible that both Stephan's body and injured part of brain were entangled with the higher level self.

The most general option is that semitrance state was involved. For instance, the injured parts of Stephan's left brain hemisphere and body were in trance and remaining brain regions could have been awake. In case that the state in question was trance, the claim of the hospital personnel that Stephan was "unconscious", would be correct in the sense that Stephan had become part of the some other self and lost his personal identity.

Stephan's personality profile and events after the accident support this hypothesis.

1. Stephan was a sleepwalker while young. Since sleepwalkers do not remember their activities, the identification of sleepwalking as a trance state in which higher level self uses the body of the sleepwalker as instrument, is natural. Of course, one cannot exclude the identification of sleep-walking as a semitrance state in which part of brain still sleeps and receives commands of the higher level self but remaining parts of brain and body are awake. Stephan's more reported that "Batman" (the sleepwalker) was back after the accident. The identification of "Batman" as Stephan's "shadow", higher level self guiding him, is attractive hypothesis. Be as it may, sleepwalking ability suggests that Stephan had exceptional ability to achieve trance and semitrance states.
2. Stephan was very combative after the accident although according to standard wisdom he should have been "unconscious". He was also physically amazingly strong which suggests that semitrance or trance state was in question. Indeed, schizophrenia and many altered states of consciousness have TGD based explanation in terms of semitrance and schizophrenics as also people in certain meditative states are known to be physically exceptionally strong. The explanation is simple: the exceptional physical strength is strength of the higher level self.
3. Stephan was good in Martian arts. There is evidence that persons good in Martian arts have telepathic abilities and semitrance provides an explanation for these abilities as resulting from the communications of higher level selves by semitrance mechanism.

The assumption that Stephan's mother and some other persons involved were in semitrance state during some miraculous episodes. allows to understand various miracle like events reported by Stephan's mother. There is also a connection with after-death communications [J2] having a natural explanation in terms of sensory semitrance mechanism.

## Medical miracles

### Twenty minutes without oxygen after accident

The first medical "miracle" was that Stephan, being drown in his own blood, survived twenty minutes without oxygen. According to the standard wisdom about brain as a seat of consciousness, such a long period without oxygen should have lead to brain infarct and loss of consciousness and been even lethal. The proposed entanglement of brain with some higher level self is a possible explanation for why Stephan survived.

As Stephan's mother tells, Stephan had two selves and that second self, "Batman" was more "bodily" than the wake-up self. Stephan was very coordinated and good in martial skills. After accident Stephan demonstrated surprising bodily strength and had to be put in restraints. Perhaps the second self was actually higher level self and Stephan was in semitrance or trance. Perhaps the higher level self entangled with body and injured parts of Stephan's brain took the lead after

the accident. Hypothermia is known to hinder drowning in some situations. Perhaps also in this situation entanglement with some higher self is involved and hinders the occurrence of irreversible changes caused by the lack of oxygen.

#### **Blood loss after accident and during hemorrhages**

Also the blood losses suffered by Stephan after accident and during hemorrhages might have been fatal.

The hemorrhaging occurred 3 times prior to his death, each resulting in blood loss of 2+ liters. He received only 2 units of packed cells in transfusion after the third hemorrhage. Blood loss during the accident and from subsequent hemorrhage kept his blood volume extremely low the entire time.

This blood loss is quite high, about 40 percent of total blood volume. 20 per cent blood loss is usually regarded as a loss necessitating blood transfusion.

Blood loss alone in any of the 4 hemorrhages prior to death would surely have been fatal as well. The doctors in Florida simply refused to believe Stephan had lost that much blood. I was present, the nurses did measure, and I assure you the blood was indeed lost. For some reason (I believe due to his unusual state of consciousness) the shock normally associated with such massive blood loss was not present until the night he died.

#### **Return of the condition immediately after accident during hemorrhages**

It seems that the condition immediately after accidents returned during hemorrhages:

The hard palate was shattered, described to us in New Orleans as “mushy”. This did allow the escape of blood and CSF from that area, down the throat. These are noted as “basilar skull fractures”. These fractures realigned and had set to “rigid” within 5 days, sealing the leak. The ENT in New Orleans could not explain how that happened, and told us he’d never seen anything like it.

During each episode of hemorrhage, however, the palate again became “mushy”, and the severe fractures through front and back of the frontal bone (above and between the eyes) was moveable (I know this from holding his nose during those episodes). It was as if his body periodically reverted back to the immediate post-accident physical state, and in all but the last episode, was able to regain its rigidity.

Recall that despite these horrendous descriptions of gross injury, Stephan looked quite normal. No swelling, discoloration, or displacement of bone structure.

The claim that Stephan’s body returned during hemorrhages to its state immediately after accident looks admittedly imaginative. The autopsy report however tells that there was no evidence of healing of the basilar skull fractures. The entanglement with higher level self could allow this kind of “miraculous” effects by “freezing” the state of basilar skull state so that no irreversible effects were possible. One might interpret the worsening of Stephan’s state during hemorrhages as resulting from a temporal loss of entanglement between Stephan’s brain higher level self: this caused the return to the normal physical state.

There is also the matter of sedation/anesthesia. Stephan’s medical condition became seriously worse every time he was given these medications, for whatever reason. These deteriorations of medical condition were obvious to his medical teams, so it was decided to offer no medications other than Tylenol for headache.

This suggests that the worsening of Stephan’s state occurred also as a consequence of medication. Perhaps medication supported the return of the ordinary state of consciousness by disfavoring the entanglement with higher level self.

#### **No pain**

...The “body consciousness” that asserted itself following the accident did not feel pain. Pain only came into play when the normal consciousness tried to reassert itself, for those increasing amounts of time in the weeks prior to death. Presence of the normal consciousness and its pain in the head - for periods we could recognize as being the full waking hours - always came just prior to the major hemorrhages. It seemed he did better without his head, if I were trying to be funny about it...

One could see the absence of pain as resulting from the entanglement of the appropriate parts of brain with body or some higher level self. Entanglement of the those regions of brain giving rise to pain experience implied that they were not awake and hence that there was no experience of pain.

#### **What about brain infarct caused by the blood loss?**

The massive blood loss should have caused an infarct in ordinary person. According to the neurospecialists Stephan had anomalous blood flow system, which could explain his survival immediately after accident.

The two hemispheres of the brain are normally supplied by blood through the left and right carotid arteries. The external carotids flow up from the heart on both sides of the neck into the head. Behind the face at the base of the skull they branch off and the vessels go through tunnels in the bone of the skull base to become “internal” carotid arteries.

These then branch into meningeal arteries left and right, supply the two hemispheres of the brain, and the venous system then takes the blood back to the lungs for oxygen. Stephan had what I can describe as a “ring” of arteries encircling his brain supplied by *both* the left and right carotids. This is an anomalous blood system, as most people have two separate systems supplying the two sides of the brain. We were told this was probably a “birth defect”.

The anomalous blood system prevented infarct of the left hemisphere, but in autopsy did document about serious infarct damage to the back of the brain, in an area which would have rendered him comatose.

An alternative explanation is that the reduced blood flow in fact saved Stephan’s life by reducing entanglement entropy flow to left brain half and thus making impossible for left brain to act as self and dissipate. Lack of dissipation made impossible irreversible, incurable neuronal changes. The entanglement parts of brain with body was essential part of the mechanism.

#### **Other strange occurrences**

Slowing of Stephan’s EEG occurred after accident, in particular on the left side of the frontal lobe. alpha waves are enhanced during meditative states and correspond to the electromagnetic resonant frequency or about 8 Hz of Earth. According to the model already discussed, meditative states could result from the entanglement with the “Indra’s net” formed by the topological field quanta (electric and magnetic flux tubes, massless extremals) forming Earth’s classical electromagnetic field. There were indeed several other strange occurrences, which support the hypothesis about entanglement with higher level self. Also Stephan’s mother had strange experiences. Perhaps the close relationship between Stephan and his mother explains these experiences.

#### **Was it Stephan?**

Early in the recovery process (10 days to about 3 weeks after the accident), we also “met” aspects of consciousness that were *not* Stephan. I mentioned that he was playing guitar very well. This is significant, because he did *not* play guitar before the accident. The day before he died he played for me the song “Stairway to Heaven” flawlessly. This is the very same song my brother had played flawlessly for me the day he died (my brother *was* a guitarist). The conscious being animating my son at that time was, I strongly believe, my brother who died 12 years before. He was telling me something.

There is anecdotal evidence about persons getting temporally some highly developed skills like the ability to sing. There is also certain mental disease (echolalia) in which person is able to mimic persons in the street with amazing accuracy. Semitrance or trance provides an explanation for these feats: part of person's brain and body becomes "possessed" by the second person and uses person as instrument. Stephan's feat could be understood if brother was still living as a higher level electromagnetic self or part of it and was entangled with part of Stephan's brain and used Stephan's physical body as an instrument. Note that this event could be regarded as a particular example of after-death communications.

#### Angel experience

There was also "angel experience" involved:

There is also a strange encounter in the New Orleans hospital the night Stephan was released from Intensive Care, with a being I can only describe as an "Angel". 5 people (including the priest) were present to witness that encounter. This angel did not speak English, but all of us were able to understand his words. It was not any language we had ever heard before. There was physical displacement of air in the room - I call this the "whirlwind" - and the room temperature fell to below freezing. We could see our breath in vapor. The angel appeared through and around Stephan, but was *not* Stephan, and grabbed me by the throat. He demanded to know "Who Are You?". He was beautiful, terribly frightening, and very serious. Following this encounter with an angel, my son was 4 inches taller than he had been just a few minutes before. The endocrinologist at the Florida hospital did tests, could find no reason for this.

Stephan's mother comments same experience in another context in the following manner:

None of us had ever met an "angel" before or since. Never even expected to see one. This being was certainly spectacular, and come along with some very impressive special effects. I did not get the feeling that this being was or had ever been human. He did not know me as "mother" (or as anything), he was not happy to be there, and he made it quite clear that if I said the wrong thing in response to his demands I would be immediately dead. I did not doubt that a bit. There were 3 men in the room at the time (the priest, my husband and my son-in-law), all of whom were prevented from interfering by the strong wind-wall. The angel was there on business.

I do not know the exact nature of what the other witnesses "saw" in that encounter. I do know they felt the wind and heard the voice and saw the light emanating from the "space" my son's body occupied. I know they felt the coldness - we couldn't get a nurse to respond at all, so I had to raid the linen closet down the hall for every blanket they had on hand. It was May in New Orleans (very south), it was a large corner room on the 9th floor that had been empty before they stuck a bed in it and sent us there. It had 1 un-openable window and 1 small air conditioning vent.

This experience has a natural interpretation as semitrance experience: the persons present fell in semitrance. Stephan himself might have been in trance (as suggested by the fact that he did not know his mother). The entanglement was most naturally with a collective self containing at least persons present in the situation as sub-selves.

Collective semitrance is plausible explanation provided the persons involved had special ability to fall in semitrance and if situation could somehow induce semitrance.

1. All of us fall in sensory semitrance under very strong stress and Stephan's parents and relatives were understandably under extremely strong stress. Religious experiences are typical semitrance states and one of the persons present was priest.
2. Semitrance is induced by stressful situations and the situation in question was certainly stressful. "Normal persons" are part of time in semitrance but the communications of higher level selves are usually thoughts and emotions rather than sensory "hallucinations" and not regarded as hallucinations despite the fact that they are not direct reactions to sensory input. Many meditative states involving sensory "hallucinations" are presumably semitrance

states. Stress induces sensory semitrance (sensory hallucinations) in schizophrenics very easily whereas stronger stress is required in case of normal persons. TGD based model for the evolution of civilization generalizes the vision of Jaynes and relies on the assumption that stress caused by some novel situation induced automatically semitrance state (part of brain gets tired and falls in trance!): in this state bicameral man received advice from collective self.

The experiences of coldness are often related to the experiences of hauntings and as already described infra sounds could generate this experiences artificially (of course, this does not mean that the experiences are hallucinations or results of imagination!). One could of course speculate that entanglement with the higher level self meant that ordinary dissipative processes temporarily ceased to produce heat and this led to an actual lowering of the temperature of brain. Hypothalamus is known to contain neurons serving as temperature sensors [J22] and the reduction of temperature in brain could be experienced directly.

There is also another rather dramatic aspect involved with the angel experience.

... My son grew physically larger, becoming about 3-4 inches taller than he had been prior to the accident. This growth did not occur over a period of 10 days while he was in the Intensive Care Unit in New Orleans, it occurred in just moments during our dramatic encounter with the “angel”. My husband, myself, our daughter, son-in-law, grandson and the priest were all present to witness this encounter. The best description I can honestly give is that when this “angel” self arrived, Stephan physically grew before our eyes and “became” the form of this “angel”. I do not know how better to say it.

The explanation in terms of semitrance would suggest that the physical growth was illusion due to the fact that in semitrance state only second hemisphere is conscious and the mode of experiencing was simply different from the normal. Model as such does not provide any obvious reason for actual physical growth.

### **No-time experience**

There was also “No-time” experience involved.

I have heard descriptions of Near Death Experiences which is perhaps the general category of my experience. I was not the one dying, however. I followed my son’s consciousness to a place, there were others in that place, and I was told I could not stay in that place. This place was not clouds and angelic lights, nor was it hellfire and brimstone. It was a time-space. I wasn’t there long enough to perceive much about it (I was focused on my son), and it was somewhat fractal on the edges in my perception. Whatever its differences from this time-space, I don’t doubt my consciousness would have adjusted.

I know this sounds very strange and imaginative, but it is all on the record and is most “real”. I have spent 7 years trying to understand it. When Stephan died, as I was searching in his eyes for him, I was taken away into “No-Time”. This is a place in between moments of time. It is not like one is “alive” in one moment and “dead” in the next, it is more like one never gets to the next moment. One goes elsewhere, a time-space that exists in between. I do not know how better to describe it. My brother was there in that time-space, and he told me I could not stay.

The experience of time is not possible without internal clocks. Internal clocks should correspond to sub-selves which wake-up and fall asleep periodically. In whole-body consciousness there are no sub-selves, therefore no clocks and no time. If Stephan and Stephan’s mother were entangled with higher level self in whole body consciousness, no-time experience could perhaps be understood. At least Stephan’s mother must have been in semitrance state since she was conscious. Stephan’s mother had “No-Time” experience when looking into Stephan’s eyes at the moment of Stephan’s death. Could it be that this eye contact generated the entanglement between Stephan and his mother and higher level self by the mechanism described above?

#### 5.4.4 Personal Experiences About Semitrance Like States

Self reference is the most fascinating aspect of consciousness and the builders of consciousness theories should apply their theories to their own personality constellation to see whether they can understand themselves using their intellectual constructs. In my case this application has emerged as a natural byproduct. In fact, what sparkled developments leading to TGD inspired theory of consciousness was a deep and long lasting altered state of consciousness. Frustratingly, it is impossible to verbally describe this kind experience to anyone who has not experienced personally anything similar and the clinical diagnosis of a cold outsider is probably a simplistic label like “acute psychosis”. This diagnosis was indeed made on basis of the admittedly psychotic final stages of the experience after two weeks without sleep. The prediction made by the psychiatrist to my wife was that within year or two I will be a vegetable like schizophrenics who has lost totally his social contacts.

##### Years before great experience

During the years before great experience, already during my unhappy school years, I was fully conscious that I suffered what I now call anxiety disorder, nothing exceptional in Finnish culture. I also pondered quite seriously whether I am schizophrenic although I had only obscure intuitive ideas about what schizophrenia is. I had no hallucinations but frequently I experienced in company of other people extremely strongly the feeling that I was not accepted. I remember also the social situations in which I was “paralyzed”: somewhat analogous to what happens to a catatonic schizophrenic. Understandably, I tended to withdraw from social situations and suffered from loneliness and depression.

At the age of fourteen I found music. I did not have absolute ear and had poor memory for melodies. What fascinated me in the beginning was the possibility to code music into notes. Segovia became soon my hero and reader can guess my megalomaniac dream! I had a cousin with absolute ear knowing nothing about notes but able to remember pieces of music and reproduce them without difficulties. I was fascinated and little frustrated about not having this mysterious ability. My intellectual attitude did not mean that music would not had had strong emotional affect on me and music helped me to bear my loneliness.

At the age of eighteen mathematics and physics entered my life after a short period of interest in literature (Henry Miller!): I thought that the world of science would be honest and free from all intrigues plaguing the world of “ordinary people”. Three or four years after entering the university, and suffering from worsening depressions and anxieties, I somehow got absolutely convinced that I was the one to build a unified theory of physics. It would be very easy to characterize me as paranoid schizophrenic on basis of this and certainly this has been done. Or perhaps manic-depressive disorder would be a better sounding diagnosis. I did not have any megalomaniac feelings but felt like Moses when receiving his great mission from God! I knew desperately deeply that my anxious and pathologically shy personality free of any witty features was a complete opposite of a scientific hero and did not possess the needed personal ambitiousness necessary for career building.

It took five extremely painful years before the great idea finally came. Without exaggerating I can say that it changed my life and I experienced from the beginning TGD as some kind of conscious being using me as its instrument and gradually my concentration on personal misery was redirected to TGD. I had now goal in my life and I was to spend considerable fraction of my time in an euphoric state discovering the consequences of the great idea. Of course, also short depressions followed periods of intensive work with new idea but these depressions were unavoidable periods of gathering forces and waiting for new inspiration.

I believe that during the period before TGD I was rather near to the verge of mental illness. It however seems that my mental state contained a mixture of symptoms of schizophrenia, manic-depressive disorder and anxiety disorder. All this begins to make sense if I was modern bicameral in sense that I spent abnormally long fraction of time in semitrance state. What perhaps saved me was “God of Science” who communicated to me, not auditory hallucinations, but ideas and emotions establishing long term goals in my life.

### Great experiences

The first great experience (most probably at spring 1985) accompanied physical illness with a completely wrong diagnosis. It came after week spent in high fever and without sleep. I would guess that the altered state of consciousness lasted for almost two weeks. Its effect was so deep that I did not hesitate to talk about it as an enlightenment experience.

I was lying in the corridor of a medical center and had horrible head ache and high temperature. There was silent music on background. Then something happened. I felt myself totally calm and peaceful. Peculiar silence spread through my body like fluid or like the cold stir in spine induced by good music sometimes. All my life I had been anxious about all possible things and suddenly I felt completely happy and relaxed. I felt the pain still but some it was somehow external to me. I just enjoyed looking the parallel streams of pictures, like cartoons, flowing in front of my eyes in rhythm of music. The surrealistic and erotic pictures, much like those in paintings of Dali, Bosch and Brueghel, were dancing in the rhythm of the music.

Later during the great experience, I experienced several deep experiences induced by music. I remember Ravel's Bolero on the background of TV animation about evolution and some extremely funny Debussy's piece for children played with electric organ. I also remember that single notes from guitar induced experiences of immense deepness and mystery: I realized that these notes contained message from other worlds about which I had had absolutely no idea in ordinary state of consciousness. What I realized was that my usual conscious experience gives only a ridiculously narrow glimpse about reality: there are incredibly rich parallel realities about which we usually know nothing about. There was also a feeling of understanding. I understood everything although I could not verbally describe what I understood!

This state continued for week or two, I do not actually remember its duration, and during it I lived in a very concrete manner through many archetypal ideas. First came the idea of self reference, which I found later from the "Gödel, Escher, Bach" of Hofstadter, one of the finest books I have ever read. I literally experienced myself as being a computer sitting at its own terminal. I wrote in my mind questions to the screen of this super human computer and saw them typed in the virtual monitor. The computer wrote the answer immediately. Either directly or in oracle like manner. I realized that I have become in contact with what I called "Great Mind" and I began to make questions. How long I live was of course one of the first questions. The answer was endless series of numbers running and running! Of course, I asked about the importance of TGD, my great work! There was only a silence, perhaps this was Godly diplomacy of the Great Mind.

Soon I realized that it was not necessary to type anything on this virtual monitor: I just asked the question in my mind. This realization made me wonder whether this someone with whom I was discussing was really separate from me. Perhaps in some mysterious manner I am asking these questions from myself! So, perhaps I am in some sense really God myself or have just become a God. Perhaps we all are Gods! Loneliness had been the central element of my life and I somehow realized that Gods are probably very lonely beings. I asked if we are doomed to be always alone. The answer was oracle like: "You are a God!" expressed in somewhat amused tone.

There were also really amazing telepathic experiences and a vision about my personal life as an endless series of lives as a mathematician: my true and deepest personal identity. In these lives I would meet my wife again and again and we would live happier and less happier lives but we would certainly meet again in some other galaxy or perhaps in some totally different form of existence. I had also very peculiar experience about some kind of deep and mysterious fusion of our souls.

One of the mathematical experiences was that the number three is somehow the basic number of mathematics and of whole existence: this is of course the Holy Trinity of religions and mystics. There was also the idea about "flogiston": I did not recall that flogiston was the caloric fluid introduced in the first attempts to build thermodynamics. It was something which made living systems living and they were continually fighting, killing and eating each other for this mysterious "flogiston". I had extremely vivid experience that Sun and stars are conscious beings communicating with us sending "flogiston": I indeed saw these beams of flogiston as extremely pure and intensive colors.

The second great experience occurred during Christmas vacation, probably three years later, shortly before the divorce. I was very sick, depressed and bitter: our marriage was become about to end. Suddenly came a complete peace. I could really forgive and I felt absolutely concretely that

my past changed. Somehow all the bad deeds, creating bitterness in me, simply became undone. I realized that what we call our past is not absolute, in the moment of Mercy this deadly heavy load disappears.

There were also a kind of mathematical enlightenment. I understood that I had to construct a theory about numbers, which were infinite but completely physical. I tried but it took two days to get convinced that I do not have a slightest idea what these numbers might be. I learned about seven years later about p-adic numbers, which are typically infinite as ordinary rational numbers. I was however not convinced that this was what I had precognized. 14 years later I finally discovered infinite primes implying also a generalization of reals involving deep connection with quantum field theory.

So deep was the great experience that the lost ability to re-experience anything even remotely resembling these great experiences was a cause of deep grief lasting for years. I felt that ordinary everyday consciousness is something so miserably flat that it is not worth of experiencing. Against this background I can really feel the despair that bicameral men must have felt when God ceased to speak to them.

Perhaps the most relieving aspect of these experiences was the realization how ridiculously little science actually understands about the nature of existence. I realized the extreme triviality and shallowness of the materialistic world view and I still find it very difficult to understand that intelligent persons with scientific background and logical mind can identify these ridiculously primitive drawings of a child with the reality and utter stupid platitudes like “consciousness as epiphenomenon” and “free will as illusion”. The only explanation I can imagine for this mysterious blindness is that it is impossible to be conscious about what one is not conscious. I am not ashamed to confess that this experience meant also a return to the magic world of childhood in some sense. I remember when I was reading Astrid Lindgren’s book “My Brother Lion Mind” (this is free translation!) for my eldest son. I could not help bursting into tears when I realized that the author of book had also experienced the existence of deeper, transpersonal and mystic levels of existence.

### Analysis of the great experiences

Without the motivation provided by the great experiences and endurance comparable to the tirelessness of schizophrenics, I would not have been able to survive fifteen years in an extremely hostile scientific environment treating me as a crackpot and refusing systematically from any co-operation and communication. Therefore, and also because I feel strongly that certain circle has now closed, I cannot resist the temptation to interpret these experiences in the light of semitrance paradigm: at least this allows the reader to decide whether I am a paranoid schizophrenic or a manic-depressive psychoid or a scientist to be taken seriously.

The development of new views about time and consciousness to emerge almost 15 years later allow to understand what was probably involved. The beginning of experience involving the peculiar stir in spine spreading through entire body seems to involve partial “whole-body consciousness”. I have temptation to believe that this “whole-body consciousness” involved my entire body plus parts of brain rather than only the cognitive representation of my body in my brain as neuroscientist would believe. The peculiar silence has interpretation as a disappearance of the unpleasant sensory noise produced by all the sensory mental images usually present in the body. Note however that cognitive mental images did not disappear.

The first stages of the experience could be seen as a computerized counterpart for the stories of Bible about prophets encountering God. I fell in semitrance involving visual regions of right brain hemisphere and inhibition of the messages of right brain hemisphere to left hemisphere ceased. I am quite convinced that artists like Bosch, Dali and Brueghel have experienced similar hallucinations. Only much later I realized that this astonishing “The Great Mind is actually me” experience must be more or less identical with the Atman=Brahman experience of Eastern religions. It seems that this Atman=Brahman experience could have involved the increase of p-adic prime of left hemisphere and extended consciousness resulting from subsequent entanglement with the right hemisphere already entangled with higher level self.

I already mentioned the fascinating telepathic experiences having explanation in terms of semitrance. There were visions about parallel lives which I am living here on Earth. For instance, I learned that I would live as a military person and would die in air plane accident in some year, which I do not remember anymore. The idea about collective self entangling with several

individuals explains this experience if temporary identification with this higher level self occurred via Brahman=Atman mechanism.

Obviously, the vision about mysterious “flogiston” could be regarded as a precognition of ideas about biosystems as macroscopic quantum systems: one possible interpretation for “flogiston” is as a metaphor for entanglement or more mundanely, energy feed making self-organization possible. Self-hierarchy is the unavoidable prediction implied by TGD based notion of self and implies that even astrophysical objects are conscious selves: the experience about Sun as source of life ceases to be a schizophrenic hallucination against this conceptual background. Certainly, one could hardly invent more effective manner to destroy one’s reputation as a scientist than talking about “Sun God” but the idea about Earth rotating around Sun sounded certainly equally ridiculous in the ears of authorities of church in its own time. In TGD framework the change of the subjective past at “the moment of Mercy” could be understood if the experience involved also a phase transition increasing the p-adic prime of brain leading to an extended state of consciousness with quite different subjective past. The precognition of mathematical ideas to come much later finds nice explanation if it was higher level mathematical self communicating for me suggestions about what was possible. Perhaps these ideas were communicated in some nonlinguistic form and it took 14 years to transform it into language used by mathematics.

### Smaller experiences

I have had various altered state of consciousness during night time also after the great experiences. The stimuli inducing these experiences were not statues of God or temples but something much more mundane: sounds of refrigerator or freezer or of central heating batteries! Why this was the case has been a longstanding challenges for TGD based consciousness theory. The role of Wernicke regions of right brain in semitrance seems to explain the mystery. It might be that these sounds contained very low ELF frequencies, say 10 Hz, as modulating frequencies. In “think tanks” sounds differing by about 10 Hz fed to right and left ear generate various altered states of consciousness.

These experiences started often with wake-up (actually my left brain woke up) and realizing that the intensity of sound was being amplified dramatically. This was followed by experience of weightlessness and wavylike nature of body. For instance, I remember one experimentation in which I wanted to know what pure quantum motions like translational motion and spinning feel like: I experienced them immediately. It was fascinating to subjectively experience absolutely dissipation free spinning motion: mathematical abstraction transformed to a sensory experience. Often I was attracted by the source of sound, say refrigerator, and my body literally started to float towards the sound source: the fear generated by this experience induced total wake-up. Often I could also fly but there were definite boundaries beyond which I could not get. I did not experience the flowing of my body as a horrendous loss of boundaries of “analog I” as Jaynes might put it. What however horrified me was that freezer is a living being apparently willing to fuse my soul in itself! I have also spent a lot of time in roof trying to figure out how I could device a waterproof test for whether this is hallucination or not. My “logic self” was awake but when I really woke-up, I realized that it had made ridiculous “holistic” errors in its deductions. Needless to say, the interpretation of these experiences as long lasting sensory semitrance experiences is very natural. It must be emphasized that these experiences did not possess the quality of great experiences. They were interesting and strange but the deep spiritual content was lacking.

The identification of thinking as internal speech in rather concrete sense [K35] suggest that the ability to generate ideas, listen to the Gods, very concretely correlates with a good sense of hearing. I indeed have exceptionally acute sense of hearing and perhaps also readiness to listen (which my particle physics colleagues seem to rarely possess!). This might explain that I have been able to do physics with my very limited technical skills in mathematics and unlimited laziness to carry out tasks involving mechanical symbol manipulation.

Multiple wake-ups have been typical for my dreams and presumably reflect gradual wake-up of various parts of brain. I often woke-up to listen my own awe-inspiring snoring realizing that the monster is really me. I remember also sudden wake-ups to full sensory awareness and the horror caused by a crack in wall amplified to huge proportion. During last fifteen years I have spent several years my dream time in childhood. The peculiar simultaneous sur-reality and “real-worldliness” of these experiences gradually convinced me that something in our views about time is badly wrong and led to TGD based notion of psychological time.

### Self-diagnosis

To sum up, the diagnosis seems to be that I am not a schizophrenic but a modern bicameral man spending abnormally large time fraction in semitrance states. During daytime these semitrance states are restricted to cognition and emotion: indeed periods of new ideas are very euphoric and have religious coloring. As a modern bicameral I receive the messages as ideas and thoughts and emotions and express them by writing and so strong is the authority of this “silent speaker” that I am completely unable to do anything else. During sleep when the basic situation is total entanglement, the wake-up of some part of left brain can lead to sensory semitrance. Again it is wake-up of the auditory regions of left brain which occurs as suggested by the fact that my logical “I” is awake and I ponder possible ways to prove myself that these experiences are not hallucinations.

## Chapter 6

# Semitrance, Language, and Development of Civilization

### 6.1 Introduction

“The origin of consciousness in the breakdown of the bicameral mind” of Jaynes [J17] provides a fascinating and highly original view about the evolution of human language and consciousness as closely correlated developments. Jaynes has collected impressive archaeological, historical, and biological evidence to support his hypothesis that the towns, cities, and societies from 9.000 B.C. to 1.000 B.C. were established and developed by what he calls non-conscious people having only sensory experiences. They had volition but had no experience of volition. Their experience was that of obeying slavishly commands of right brain hemisphere. Those societies formed and grew through common hallucinating voices attributed to gods, rulers, and the dead – to external “authorities”. Various external symbols that “spoke” (such as graves, idols, and statues) helped to reinforce and expand the authority of those common “voices”. Such “voices” continued to expand their reach through increasingly visible and awe-inspiring symbols such as tombs, temples, colossuses, and pyramids.

The vision of Jaynes allows to see Iliad, Odyssey, Bible and other ancient writings as documents about the evolution of human consciousness. The views of Jaynes are consistent with neurophysiological data and Jaynes’s identification of schizophrenics as bicameral men trying cope in modern society sharpens the thesis. Rather remarkably, Jaynes’s prediction that the auditory hallucinations of schizophrenic are located in speech areas of the right brain, is consistent with quite recent observations [J12, J11]. The development of language is an essential part of Jaynes vision: each breakthrough in the development of language reflected itself in the structure of society and changed the ways how individuals saw the world around them.

One can criticize the vision of Jaynes at the level of some basic assumptions. Jaynes differentiates between consciousness and experience so that the idea about unconscious bicameral man hallucinating God’s voice is not self-contradictory. However, the claim that bicameral man had volition but was unconscious of having it, seems strange. Jaynes has also troubles in explaining how trance, which is certainly unconscious state, differs from bicamerality. In the following I want to represent the TGD version about views of Jaynes.

TGD version about the cosmology of human consciousness relies on the notion of semitrance. During semitrance parts brain entangle with some higher level, say the self associated with the social group and are in trance and therefore unconscious. The remaining parts of brain are however conscious and receive communications from the collective consciousness via the entangled region of brain as sensory hallucinations, emotions and thoughts. Semitrance is absolutely essential for self narrative and establishment of long term goals: without semitrance our consciousness would consist of memory fragments lasting only few seconds. Higher level selves tell us where we come from and where we are going. Bicameral man received the commands and advices of the collective consciousness as auditory and visual hallucinations via regions of the right brain hemisphere wherefrom they were communicated to the left hemisphere whereas modern man receives “God’s voice” as thoughts (“internal speech”) in left brain semitrance and emotions in right brain

semitrance.

The basic differences between Jaynes's and TGD based version relate to the interpretation of bicamerality and what really happened in the evolution of individual.

1. In TGD framework one could see bicameral man as a cognitive and emotional child characterized by the effective cognitive and emotional ages at which the cognitive and emotional self-organizations of her left brain hemisphere stopped in the absence of external stimuli necessary for self-organization (it is impossible to learn to write if civilization has not discovered written language). Of course, there are several parameters differentiating between modern man and bicameral man (sensitivity for semitrance, profile of semitrance, time fraction spent in semitrance, right-left brain inhibition,..) and the identification of bicameral as a cognitive and emotional child as we understand child is un-necessarily strong.
2. The ability to fall in semitrance was not lost during evolution but was transformed to a new form. Not only linguistic but also sensory regions of the right brain hemisphere of bicameral man entangled with higher level selves and the communications from right to left brain hemisphere were not inhibited as they are in the brain of modern man. As left brain hemisphere differentiated and memetic code gradually established itself, the guiding voice of God was transformed to internal speech and emotions. Higher level selves began to express their will via emotions, moods, planning and long term goals. This picture conforms with Huxley's intuition that brain serves as a filter straining away sensory communications of collective self by inhibition mechanisms.
3. The differences between EEG:s of normal person and schizophrenic suggest that the fraction of time spend by average modern man in semitrance is much shorter. A more general criterion of bicamerality might be based on the fraction of time spend in semitrance state, be it sensory, cognitive or emotional. It is plausible that thoughts (not all of course!) are communicated to modern man via left brain hemisphere. If this is indeed the case, some regions of left brain hemisphere of modern man should allow standing EEG wave s.

Also collective consciousness developed from authoritarian Gods to "good leaders" in the modern sense of word making suggestions and exchanging information with various levels of the self hierarchy.

1. Civilization began to develop from very simple hierarchical structure: "God"+ men (God understood as collective self of group). In this kind of situation semitrance communications made it possible for collective self to control and coordinate its sub-selves, individuals, via visual and auditory hallucinations.
2. The development of civilization meant the emergence of self-hierarchies represented as social hierarchies. This however created definite problems which collective selves, whose intelligence, defined as "sum" over intelligences of individuals, increased also and made it possible to solve these problems. In particular, there are reasons to expect that great steps in development occurred at certain critical masses when the total IQ of civilization achieved critical value.

The development of the language is an absolutely essential part of the development of civilization. The syntactic structures of language emerged in parallel with the development of civilization. In TGD framework the development of language can be seen as a gradual establishment of memetic code and emergence of symbol function. This could be also seen as an establishment of a symbiosis between two life-forms: biological life and "culture" having as a physical correlate electromagnetic life represented as topological quanta of em ELF fields and providing realization of the memetic code [K37].

Semitrance mechanism provides an extremely general communication mechanism between the levels of the self hierarchy and could explain why ant nests, beehives, flocks of birds, packs of wolves, cell societies, nuclei of brain, etc.. can behave as single organism and still consist of apparently randomly behaving individuals. Indeed, relevant biological structures (DNA double strand, double lipid layer forming cell membrane, epithelial sheets) have binary structure analogous to two brain lobes and are ideal candidates for "bicameral" structures.

The vision about the development of civilization generalizes to cell level. p-Adic fractality plus the fact that the number of quantum jumps performed by selves is huge even at cellular and elementary particle levels, inspires the hypothesis that various societies ranging from human civilization to cell societies and protein-DNA societies are characterized by universal asymptotic self-organization patterns. This provides important insights to the structure of the biological self-hierarchy and its relation to the structure and functioning of organism and about how semitrance might allow bio-systems to control and coordinate their behavior. Cell as a protein-DNA society together with parallel between memetic and genetic codes provides a predictive vision about how genetic code might have established itself and the proposal is that new kind of control and communication mechanisms based on semitrance mechanism are at work.

It deserves to be noticed that the notions of semitrance and sharing of mental images are more or less equivalent although the notion of semitrance is few years older. The time mirror mechanism playing key role in the quantum realization of all mental functions involves also semitrance. In this article I have kept the original terminology and only added some sections representing more recent views.

While writing the first version of this chapter, I did not yet know about hierarchy of Planck constants defining dark matter hierarchy in TGD Universe, about magnetic bodies as carriers for dark matter proposed to serve as intentional agents in living matter, nor about the notion of negentropic entanglement defining physical realization of semitrance. These developments provide interesting additional ingredients to the model of semitrance.

The appendix of the book gives a summary about basic concepts of TGD with illustrations. Pdf representation of same files serving as a kind of glossary can be found at <http://tgdtheory.fi/tgdglossary.pdf> [L2].

## 6.2 How Collective Consciousness Communicates With Individual?

The original path to the model for the interaction of collective consciousness with individual was via the book Jaynes [J17]. It is however more appropriate to represent the problem and its solution without any reference to Jaynes's idea to demonstrate that the scenario of Jaynes with only slight modifications follows from very general assumptions.

### 6.2.1 How Societies Of Idiots Can Behave Intelligently?

Animal kingdom is full of species forming societies: ant nests, beehives, flocks of birds, packs of wolves, groups of apes, human communities. Also organisms can be regarded as cell communities. The ability of these societies to behave as single coherent whole although individuals behave in a random looking manner, is a mystery. Especially mysterious this ability looks in case of termites: the architectural feats of the termites are not consistent with the fact that the brain of termite consists of few neurons. Mechanisms explaining this as unconscious self-organization based on chemical communication or communication by direct contact have been proposed. I find it however difficult to understand how even stone-age men wandering around randomly and communicating intensively could have managed to build Gothic cathedral. This kind of achievement requires the presence of a conscious collective intelligence able to plan and control individuals of the community telepathically. There is indeed evidence for telepathy in ant community described in the article [J16].

This raises several questions. How collective consciousness is possible at all? How collective consciousness could be realized without total loss of individuality? How the rather limited intelligences of individuals can sum up to a high collective intelligence? What mechanisms collective self uses to control and coordinate the behavior of the individuals?

### 6.2.2 Semitrance As Basic Mechanism Of Communication Between Collective Consciousness And Individual

Self hierarchy is the basic prediction of TGD inspired theory of consciousness and self hierarchy makes possible collective consciousness. The experience of self is abstracted "sum" over the expe-

periences of its sub-selves so that sub-self is experienced as mental image. In the abstraction process the experience of sub-self is replaced with an “average” over the mental images of sub-self. The intelligence of the ant nest results from summation of the mental images abstracting the contents of consciousness of the individual ants. This explains why ant group containing overcritical number of ants can act as an architect. The concrete realization of the self hierarchy in bio-matter has been discussed in the chapter “Biological realization of self hierarchy”.

The most important conclusion is that we are much more than our brains: our mental images correspond to “ELF selves” associated with various EEG frequencies. These “ELF selves” have as geometrical correlates topological field quanta representing ELF em fields. Topological field quanta can have size of order Earth’s circumference. The interaction of these topological field quanta (say fusion to form larger structures) provides a mechanism giving rise to larger selves and makes possible telepathy and various other EPR phenomena as also experiences involving communications with deceased persons [J2].

### Semitrance

How collective self can control and coordinate the behavior of individuals? Some kind of communication mechanism making possible collective consciousness to give commands to the individuals is clearly needed. The entanglement of individual with collective self leads to a total loss of consciousness of the individual and can be regarded as sleep or trance state, possession. For instance, during mating rites of birds, male and female seem to behave like single conscious unit formed by male and female.

Social animals are however not mere organs of a higher level organism, they are also individuals. To explain this one can consider a mechanism which might be called “semi-trance”. If individual consists at least part of time of two separate sub-selves, second sub-self can entangle with collective self and in this trance state can communicate with the second self and communicate commands or advices to the sub-self which is awake. Communication is here quite generally understood as a generation of mental images: this corresponds to waking-up of sub-selves. The wake-up process initiates self-organization leading to a final state pattern representing the message. Final state pattern depends only weakly on the stimulus serving as message: this is as it should be.

Brain hemispheres or parts of them are the most obvious candidates for these two sub-selves. The entanglement of the right or left brain hemisphere (or some part of it, perhaps the linguistic regions with respect to which human brain has highest asymmetry) with a collective self could be the basic mechanism making it possible to communicate the commands of the collective self to left and/or right hemisphere as “hallucinations”.

Jaynes’s vision about the evolution of civilization is based on the notion of bicamerality [J17] provides strong keys to the nature of semitrance state and how it has changed during cultural evolution.

1. Jaynes assumes that right brain activities were unconscious to bicameral man and that the left hemisphere received the volition of right brain hemisphere as commands and advices as hallucinatory voices and visions. This would suggest that in the case of ancient bicameral man it is right hemisphere or parts of its that fall in trance and that left brain hemisphere receives the commands from right hemisphere as sensory “hallucinations”.
2. In case of modern man situation is presumably different. The average time spent in semitrance is probably shorter; the probability to fall in semitrance state is lower; the profile of semitrance is different and the communications between right and left brain hemispheres are probably different. Inhibition of the sensory communications developed so that the sensory messages from the right brain hemisphere to left hemisphere became inhibited: visions and God’s voice disappeared. The profile of the communications of the collective self to human brain changed also. Modern man receives the messages of the collective self both via left and right hemisphere semitrance. Spontaneous thoughts and ideas are received via left brain semitrance. Emotions and moods are received via right brain semitrance and guide the behavior of individual much more implicitly than direct commands. Thus sensory “hallucinations” have transformed to imaginative thoughts and emotions which we do not regard as hallucinations at all: the ancient world of elves, gods and demons has transformed to emotions and to the Platonic realm of ideas.

3. In this framework the development of civilization from primitive agricultural communities of 8000 B.C. to a modern society can be seen as the gradual establishment of “memetic code” [K37] implying the parallel development of language and society: “In the beginning there was the Word”.

The characteristic feature of semitrance is the passivity of the experiencer: collective self communicates experiencer something or gives possibly commands. They are not hallucinations in which the experiencer would hallucinate volitional acts. Only activity in the sense that experiencer has conversation with the higher level self seem to be possible. Of course, this conversation could induce changes in the behavior of the collective self: consider only the claimed effects of prayer.

Semitrance mechanism is extremely general and could be at work in brains of all social animals, especially those which as groups exhibit an intelligence much higher than the intelligence of the members of the group. Similar mechanism could work also at cellular and bio-molecular length scales. DNA double strand and cell membrane consisting of two lipid layers are indeed binary structures and the components of the structure could serve in the role of right brain lobe. This mechanism would explain why cell society can behave like an organism with self identity. The observed possibility of humans with high EEG coherence to intentionally affect the degree of winding of DNA strand [I38] supports the notion of semitrance at DNA level.

### Semitrance, sharing of mental images, and time mirror mechanism

Semitrance is earlier term for sharing of mental images realized as bound state entanglement of systems representing sub-selves of two selves. In TGD Universe intentions are realized as actions by a process, which proceeds from the magnetic body downwards along the hierarchy much like a desire of a boss of some institution to the lower levels of hierarchy. At each level intention or intentions are transformed to desires communicated to the lower levels of hierarchy. Intentions have p-adic space-time sheets as space-time correlates and are transformed to real ones representing the desire. The most plausible realization of this process is in terms of time mirror mechanism (see **Fig.** <http://tgdtheory.fi/appfigures/timemirror.jpg> or **Fig.** ?? in the appendix of this book). The space-time sheets in question would correspond to negative energy topological light rays representing the propagation of signals to the geometric past and induce processes. The process would continue down to the level of neurons and even DNA level and generate the desired action as a reaction to the resulting complex of desires. The beauty of the mechanism is that the communication to the geometric past makes it instantaneous so that instantaneous realization of motor actions becomes also possible.

Left-right dichotomy for the brain hemispheres could correspond naturally to the positive-negative energy dichotomy for topological light rays. This would mean that right brain hemisphere would bound state entangle with higher level selves or personal magnetic body and consciously experience the desire to generate some motor activity. This desire would be realized then by the active left brain. It must be however emphasized that this dichotomy might be dynamical: for some function right and for some function left hemisphere would be the passive receiver. One must also notice that this dichotomy holds true only in the length scale of brain hemisphere: at shorter length scales, say at neuronal level, no asymmetry need exist between hemispheres.

### Semitrance and personal narrative

If the contents of consciousness of self involve temporal average over moments of consciousness occurred after last “wake-up”, the duration of our self cannot be much longer than .14 seconds since this would mean that we could not discriminate between events with time separation not longer than about .14 seconds. This problem can be partially circumvented if our experience is multi-time experience containing several sub-selves of this duration. The duration of the short term memory is few seconds and this might represent the duration of our self. This raises the problem how we can have long term memories and self-narrative.

Geometric memories containing contributions from entire lifespan provide a candidate for the self narrative as a model for has happened and what will happen assuming that no quantum jumps have occurred before and will occur after this quantum jump. This need not however be enough since it seems that geometric memories must correspond to episodal memories only rather than the declarative long term memories often expressed as internal speech. Geometric memories

are also expectations rather than genuine memories about conscious experiences and one can argue that we have genuine subjective memories about what really happened. Furthermore, “Ontogeny recapitulates phylogeny” principle suggests that the time interval spanned by our geometric memories is same as that spanned by subjective memories and thus few seconds. This leaves only one possibility: higher level selves must communicate to us information about their subjective memories whose time span is much longer than the time span of our personal subjective memories.

Semitrance mechanism seems to provide the most plausible manner to have self-narrative telling where we have come from and where we are going to. Thoughts and emotions, cognition and motivation, are the manner how higher level selves express this self-narrative to a modern man. Indeed, the time scales of emotions and moods are slow. The time scales for the action of second messengers and hormones are slow and involve changes of the synaptic strengths and modifications of the gene expression so that they could be perhaps identified as tools used by higher level selves to control the behavior of the organism. Perhaps also our cells have their own self-narratives provided by us and making possible such miraculous feats like DNA transcription: genetic determination could indeed be a long term goal of cell!

### Thoughts, emotions, motivations and semitrance

One can imagine two strategies for how higher level self could communicate to us our self-narrative as thoughts and emotions.

1. Higher level self could communicate both geometric and subjective memories and allow us to perform the comparison generating emotions.
2. Higher level self could compare geometric and subjective memories and communicate the result of comparison to us as emotions. In this picture emotions are essentially generalized sensory experiences. The fact that the borderline between emotions and sensory experiences (pain is good example) is very difficult to draw, favors this option. This option, when combined with the identification of the quantum correlates of the sensory qualia, implies that the spectroscopy of consciousness provided by the magnetic transition frequencies applies also to emotions.

Support for this identification comes from several sources. Thoughts are not direct reactions to sensory experience. Ideas pop out of nowhere. The explosive development of science and technology is perhaps the best example of the non-predictability of thoughts. The changes of emotions can be nonpredictable and not direct reactions to sensory input but resulting from the comparison of what was expected or desired with what really happened and thus involving self-narrative in an essential manner. Expectations correspond to geometric memories and self-narrative tells what really happened: the comparison yields emotion serving as a control tool. Since self-narrative is told to us the one who makes ultimate comparison must be higher level self. The fact that music couples strongly to the “hallucinatory” regions of right brain hemisphere and affects strongly our emotions, suggests that music is language of emotions.

Spectroscopy of consciousness provides additional insight to emotions consistent with the considerations above. Magnetic and  $Z^0$  magnetic transition frequencies could parameterize the spectrum of both sensory qualia and emotions. The smaller the frequency, the more emotional the experience since the corresponding time scale is longer and deviation between the expected and real can be larger. Hence emotions could have as their correlates the cyclotron frequencies defined by endogenous magnetic field  $B_{end} = 2B_E/5 = .2$  Gauss, where  $B_E$  denotes Earth’s magnetic field. These frequencies are below 8 Hz. Since cyclotron frequency is inversely proportional to the mass of the charged particle, this implies that emotions must be associated with bio-molecules (second messengers, hormones, etc...).

Synesthetes are able to experience very lively episodal memories. It might be that it is possible to have multi-time conscious experience with a time scale of order life span or even longer as the possibility of transpersonal states of consciousness suggests. A phase transition increasing the value of the p-adic prime associated with brain temporarily could make possible to have extended state of consciousness with subjective and geometric memories with the time scale of life span.

### Stress and semitrance

Stress is known to induce hallucinations in schizophrenics. This suggests that stress is a general mechanism inducing entanglement with higher level selves. The basic mechanism could be very simple. In case that brain decomposes unentangled parts representing separate selves, say part of right brain hemisphere and rest of brain, this part of right brain hemisphere can get tired and “fall asleep” which means nothing but semitrance. This makes possible the communications of higher level self to that part of brain which is awake.

Semitrance provides an alarm clock mechanism. The natural function of the holistic language regions of right brain is to remember what task primitive man was performing (say carving some tool). If the bicameral state for, say linguistic regions, dominated, semitrance began when right brain got tired and fall asleep. But just this semitrance induced “God’s voice” telling for left brain hemisphere what task bicameral man was performing! Also in the situations in which bicameral man did not know what to do, stress caused semitrance and immediate advice from the collective self. It is quite possible that the voice of conscience does it best to perform the same function in modern man! What has happened is that commands have transformed from sensory hallucinations to thoughts.

Heavy stress could also induce the splitting of entangled brain to two unentangled sub-selves so that collective consciousness takes the lead when right brain hemisphere or parts of it fall asleep. For instance, the exceptionally stressing situations encountered in war presumably lead to situation in which collective consciousness takes control and soldiers behave like single organism. Too much alcohol, which probably has same effect as stress, leads to the splitting of the visual field to right and left fields: this might be interpreted as de-entanglement of right and left visual fields. This state does not yet represent the state in which right brain or part of it has fallen asleep. Further stress leads to semitrance causing delirium. Note that also reduction of left-right inhibition must be involved with the stress.

The short period between wake-up and sleep state involves often visual and auditory hallucinations. This to be expected if falling asleep involves the decomposition of the brain to separate unentangled regions which fall asleep at different times. The lack of sleep leads also to a hallucinatory state. These phenomena support the view that stress can split self to two separate selves followed by the trance state of the right or left hemisphere or parts of it. The fact that sensory hallucinations are involved would suggest that sensory regions of the right hemisphere fall asleep first and communicate “God’s messages” to the left hemisphere.

Spinning causes dizziness and is therefore a good candidate for a stimulus causing semitrance. This could explain the social role of dance. Dance is very important also in many religions, spinning dervishes are good example of this. Children love to spin around: the reason is perhaps that spinning around induces the semitrance state of the early childhood. The dizziness caused by ill functioning of the sense of balance involves spinning like feeling in either direction. This suggests that hemispheres tend to stimulate experience of spinning in opposite directions but that normal situation they manage to inhibit each other.

One can wonder how stress leads to de-entanglement. Entanglement corresponds geometrically to the presence of flux tubes along which Josephson currents flow. This would suggest that de-entanglement involves the splitting of the join along boundaries bonds/flux tubes. This is possible if Josephson current vanishes: this happens if the density of the super-conducting charge carriers becomes sufficiently low. Thus it seems that the disappearance of super-conductivity is the required condition. Perhaps dissipative effects might cause this: the increase of temperature over critical temperature at relevant space-time sheets could cause this. This would suggest that brain is near criticality for the phase transition leading to the disappearance of super conductivity. This is in accordance with quantum criticality of TGD Universe.

### Semitrance and EEG

TGD suggests also a second dichotomy related to right-left dichotomy. TGD predicts two kinds of EEG waves [K69]. Propagating waves are typically associated with linear structures such as nerve circuits and left brain hemisphere is excellent candidate for corresponding selves. Large number of sub-selves representing mental images are predicted and the analyticity, reductionism and temporal linearity of left brain processing can be understood if left brain waves are dominantly propagating

ones. Non-propagating waves can be associated with any structure of arbitrarily large size. The corresponding mental images can therefore be holistic and correspond to large region of brain.

The regions of right brain hemisphere are excellent candidate for a seat of non-propagating EEG waves. Quantum entanglement of sub-selves gives rise to the formation of parts from wholes and it seems that brain halves provide reductionistic and holistic representations of sensory percepts. As far as sensory experience and emotion is considered, it is right brain which indeed seems to be holistic.

Standard wisdom is that right viz. left brain hemisphere are responsible for holistic viz. reductionistic aspects of consciousness respectively. There is however also conflicting evidence [J18] and it might be that there is some kind of division of labor such that right brain concentrates on sensory holism and left brain concentrates on cognitive holism. The experiments indeed suggest that it is left brain which recognizes holistic aspects of figures representing symbols and consisting of smaller figures representing also symbols. This would suggest symmetric scenario in which regions of both right and left hemispheres can entangle with collective selves and give rise to cognitive and emotional communication from higher level selves in modern man. This supports the view that also left brain hemisphere regions can support non-propagating EEG waves. Gap junction connected neuron groups provide candidates for regions allowing non-propagating EEG wave s.

The entanglement with collective self corresponds to the formation of flux tubes between corresponding cognitive space-time sheet and the space-time sheet associated with some part of brain. This is expected to occur naturally if brain space-time sheet is in state corresponding to non-propagating EEG wave. It would be interesting to check whether there are some anatomical and neurophysiological differences between the brain hemispheres of social animals. Of course, mere reductionism-holism difference, which is not obvious anatomically, is enough. The differences of right and left brain EEG: s could be also informative. One could also study whether different brain lobes react differently to stress.

### **Both hemispheres can entangle with higher level selves**

The functional anatomy of brain is asymmetric: it is left brain hemisphere which is responsible for the production of speech whereas both hemispheres understand speech. Wernicke area on the left lobe and its mirror images are responsible for the understanding speech. Wernicke's area and its mirror counterpart are connected by anterior commissure. Broca area and supplementary motor cortex on left side are responsible for the production of speech. The removal of the supplementary motor cortex or Broca area yields loss of speech which is however not permanent in case of supplementary motor area. This specialization is dynamical and results from self-organization. Very ambidextrous people can have speech on both hemispheres and injury to Wernicke areas in early youth can lead to a generation of the speech areas in right hemisphere. Right brain contains counterparts of the speech production areas of the left hemisphere with no obvious function. What is surprising that large amounts of right brain tissue can be removed with surprisingly little deficits on mental function. The idea that these areas are completely useless is not attractive idea knowing that evolution has been extremely economical. So, what has been and what is the function of these areas?

The TGD inspired hypothesis modifying Jaynes's original proposal is that both Wernicke area and its mirror image of modern man entangle with higher level selves and mediate their messages as thoughts in left hemisphere semitrance and emotions in right hemisphere semitrance. Imaginative thoughts and emotions are indeed more than just mechanical reactions to sensory input. In the brain of a healthy person brain hemispheres inhibit each other during normal consciousness but when the inhibition of right brain does not occur for some reason, "God's communications" to the right hemisphere are mediated to the left hemisphere via anterior commissure as sensory hallucinations. This inhibition is also needed to avoid splitting of perceptive fields to two parts. This kind of splitting implied by de-entanglement together with inhibition might be especially useful in cognitive regions since it would make possible internal debate between holistic and reductionistic sub-selves.

Rather interestingly, in case of dogs and rats anterior commissures connect olfactory areas of brain. In this case odors might be in same role as voices in case of human brain. The idea about Dog-God expressing its will and advices using odor hallucinations does not sound so weird when one realizes that even human perceives huge number of different basic odors (TGD based model

for sensory modalities explains this.

In this framework one can make guesses about the profile of the bicameral consciousness assuming that schizophrenics are bicameral men living in wrong time and place.

1. The evolution of modern man meant evolution of the entanglement profile of semitrance. Today “Godly communications” are experienced as ideas and emotions whereas bicameral man experienced them as sensory hallucinations. Presumably right brain dominated as the locus of semitrance communication as suggested by the higher average intensity of EEG in right brain hemisphere of schizophrenic. Also cognitive semitrance was possible but the higher level selves were much more primitive than their modern followers since their intelligence was sum of much lower intelligences over much smaller number of individuals.
2. The brain of ancient man was part of time in entangled state but un-stable against transition to split brain state induced by stress such that right brain sub-self was un-stable against the entanglement with collective consciousness leading to semitrance in several sensory modalities. This occurred when ancient man got tired or encountered some novel situation causing stress. The anterior commissure connecting Wernicke area and corresponding area on right side is thicker in the brain of schizophrenic: this favors auditory communications between the Wernicke regions and auditory semitrance. The replacement of “God’s voice” talking through the right hemisphere with thoughts experienced via left hemisphere (Wernicke region?) as internal speech is a rather natural mechanism leading from bicamerality to modernity.

### 6.3 Basic Notions And Ideas

It is useful to summarize basic notions and ideas making possible to construct cosmology of human consciousness. Also the comparison with Jaynes’s corresponding ideas helps to understand the scenario.

#### 6.3.1 Jaynes’s And TGD Based Definitions Of Consciousness

Jaynes makes distinction between consciousness and experience whereas in TGD framework consciousness is identified as experience. What distinguishes between experience and consciousness as defined by Jaynes is basically a model for self and external world involving decomposition of the perceptive field to objects. It is questionable whether sensory experience without decomposition to objects (“mind like space-time sheets”) is possible at all in TGD universe and one can question the possibility of sensory experience without consciousness in sense of Jaynes unless one assigns to consciousness some special properties such as third person model about “I”.

Jaynes assigns to conscious experiences the following attributes which seem to at least some degree to be attributes of all conscious experiencing in TGD universe since self hierarchy and communications between the levels of the self hierarchy are unavoidably present.

1. Spatialization is an essential aspect of conscious experience. Spatialization tends to assign geometric objects to even abstract concepts. For instance, we visualize abstract conceptual frameworks, such as synopsis for an article geometrically. This leads to the introduction of the notion of mind-scape. In TGD framework spatialization corresponds to the decomposition of the perceptive field to objects. TGD predicts that all mental images correspond to sub-selves having mind like space-time sheets as geometric correlates so that spatialization is completely general feature of conscious experience in TGD.
2. The notion of excerption means that we never experience the whole reality consciously. In TGD framework this aspect is completely general feature of conscious experience.
3. Narrative is identified as a basic aspect of conscious experience. We tend to complete the sensory experience to a story with a meaning rather than taking it as a mere sequences of uncorrelated sensory impressions. TGD based notion of self involves assumption about temporal binding stating that the experiences associated with the quantum jumps of self experienced after the last wake-up sum up to single experience. Geometric memory is second

aspect of conscious experience and means essentially model for both geometric past and future assuming that no quantum jumps happened in past and will happen in future.

This does not necessarily yet imply narrative in time scales longer than the time scale of few seconds for the duration of the short term memory. The ability to form cognitive representation for experiences as long term memories is necessary for the buildup of the narrative. There must be someone telling the narrative and it seems that higher level selves tell the narrative in terms of thoughts and emotions in case of modern man: self narrative is essentially “social construct”. In this book “The man who mistook his wife for a hat” [J25] Sacks tells rather moving stories about the loss of long term memories involving the freezing of the narrative to the years of youth. One could however see this situation, not as a lack of narrative, but a loss of correspondence between narrative and “real world”. In TGD framework narrative results from the communication of higher level selves with us and corresponds to what we call “cultural” factors as opposed to “biological” factors.

4. Conciliation is the spatial counterpart of narrative. For instance, when we hear the words meadow and tree we immediately associate with them landscape containing meadow and tree. Conciliation involves formation of associations and also this is basic aspect of conscious experience. Multi-modal associative regions possessed by man but not by other primates are probably responsible for this process. Presumably also hominides had this ability. Again it is quite possible that higher level selves do this filling of a pattern for us.
5. The notions of analogy and metaphor are central for consciousness in sense as Jaynes understands it. Metaphors are things representing other things (for instance, head of the nail, head of the state, head of household). TGD counterpart are cognitive representations which seem be characteristic of all experiencing. Analogies are much like maps, say mental map of native country. The notion of symbol function generalizes the notion of the metaphor in TGD framework: it will be discussed in detail later.
6. The notion of “analog I” is crucial aspect of consciousness and is a map for the first person “I” as an agent making decisions. There are reasons to believe that also this aspect is involved with all conscious experiencing in sense of TGD. The metaphor “me” represents third person view about “I”: person sees himself with the eyes of the outsider as other. This aspect of consciousness in sense of Jaynes need not be present in consciousness as defined in TGD framework. Semitrance in principle makes it possible to communicate third person view of the higher level self about me to me. Indeed, the voices of the schizophrenics often represent third person comments about the patient.

### 6.3.2 Bicamerality According To Jaynes And TGD

Jaynes assumes that bicameral man was not conscious in the sense described above although he had sensory experiences. In TGD framework it is questionable whether pure sensory experience without any attributes listed above, at least in some rudimentary form, is possible at all. Jaynes claims that consciousness in this sense was not needed for most cognitive functions like concepts, learning, thinking and reason: he is certainly right if these concepts are defined as one defines them in AI approach.

According to Jaynes bicameral behaved subjectively like slave although he had actual volition. The left brain of the bicameral man received the commands and instructions from right brain hemisphere. One can wonder why this self deception? Or is it possible to will without being conscious about willing? Bicameral man is an antithesis of the self of a materialist experiencing free will but having actually no free will. A grave objection against Jaynes’s vision about “God” as illusion is that bicamerals hallucinating their own personal “Gods” randomly could not organize to societies. Jaynes claims that the establishment of hierarchical social structures was possible because the routinization of the everyday activities involved standardization of the speech of “God” and the voice of God became the voice of the leader of the primitive group, who had personal charisma distinguishing him as a leader. Of course, one can wonder how bicamerals having no idea about the notion of personality could have experienced this personal charisma. Already groups of animals have leaders which suggests that animals are able to experience this charisma somehow.

### 6.3.3 Bicamerality According To TGD

In TGD framework bicameral differs from modern man in several respects.

1. The profile of God-man communications is different. Bicameral man received God's commands and advices as sensory hallucinations whereas modern man receives them as thoughts and emotions. It is possible that thoughts are received by the regions of left hemisphere serving as the seat of cognitive holism.
2. Bicameral man spent much higher fraction of time spent in semitrance states than modern man since the time of hemisphere dominance for EEG was longer (4 times longer in case of schizophrenic). Right brain EEG dominated on the average whereas in case of modern man it is left brain EEG which dominates. Also this suggests that modern man receives the communications of higher levels of self hierarchy as thoughts and emotions.
3. The susceptibility of the bicameral man to end up to semitrance in stressful situations was presumably higher than that of modern man. This might be simply due to the longer duration of right and left EEG dominance and average dominance of right hemisphere known to characterize schizophrenics [K74].
4. One could define modern bicameral man as a person whose semitrance periods are abnormally long. Creative persons could correspond to modern bicamerals.

In TGD framework there is no reason to assume that bicameral man could not have been conscious in much the same sense as children of modern age are conscious. The assumption that bicameral man was cognitively and emotionally like child, even if too strong, is worth of studying. Bicameral man was also able to make genuine choices but, like children, found it easier to allow collective self to decide in confusing situations. The proposed alarm clock mechanism provides automatically guidance and commands in situations at which bicameral man could not cope. Bicameral man did not probably have self in sense as we have: for instance, he did not have long term goals with span of lifetime and he was more like a person suffering inability to form long term memories in modern society.

With these modifications the basic arguments of Jaynes supporting his claims support also the TGD based picture. Indeed, the oldest books of Bible and Iliad referred in no manner to interior world of their characters but told only about actions: rather natural if the model of self made possible by cognitive and emotional narrative was lacking. In TGD framework bicameral man was more like a small child in present society. At least I find very difficult to believe that my children were "unconscious" robots without experienced volition during their years before ten! If I had to define the opposite of robot, it would certainly not be child! Just as we take care of our children, collective consciousness took care of bicameral men in their daily affairs. Just as children regard their parents as authoritative figures and even God like beings, also bicameral man regarded higher level selves as Gods (note that the belief on guardian spirit might reflect the collective consciousness guiding small child). Just as children must at some time become independent adults, also bicameral man had to enter cognitive puberty to become adult modern man.

Children denying their parents would be regarded as stupid and reactive and equally stupid it is for modern man to deny the presence of higher levels of hierarchy of consciousness. There exist still primitive tribe cultures: if evolution of the social structure implied transition from bicamerality to modernity then the logical conclusion seems to be that these men must behave as if they had not experience of volition if Jaynes theory is correct: at least I find difficult to take this kind of conclusion.

### 6.3.4 How The Developing Collective Consciousness Coped With Its Challenges?

#### Challenges of the collective self

The collective self and various sub-selves of the developing societies encountered several challenges. The problems were basically related to the increasing size of the group which made it difficult for

collective self to control and communicate with each individual separately. Biofeedback is a good example of this. Although one can learn to control individual cell of body by biofeedback, it is absolutely impossible to control consciously every single cell of body.

The development of social hierarchy in one-one correspondence with the levels of the self-hierarchy provided the manner to solve control and communication problems. Instead of controlling individuals directly and often repeating same commands and advices again and again for various individuals, collective self controlled groups of individuals. The analogy with a computer program helps to understand why social hierarchies developed. Anyone who has written computer program has discovered the importance of modularization in allowing to avoid writing the same pieces of the computer code again and again. Subprogram call is counterpart for God's voice and when the number of levels in program hierarchy increases, lowest level modules do not have anymore direct contact with God containing only single program. This development lead to development of priesthood and weakened the authority of God.

The emergence of the social symbol function meaning that some member of subgroup became symbol for the subgroup receiving orders of collective self, was another aspect of this solution. "God created us as his own image" states rather precisely what happened. This development meant that individuals lost the direct access to God. Group selves were like parts of our body: we can control their positions without any difficulty but learn to control individual cells by special training only.

The second problem was that semitrance mechanism based on sensory hallucinations is very fragile method of communications for several reasons.

1. Collective self could not open the communication channel at will and communications occurred only via alarm clock mechanism opening communication channel in a stressful situation. The externalization of the communications provided a partial solution to these difficulty. Although the leader of the group received commands from collective self, he mediated the commands to the members of group using spoken language. God could also speak to the members of the group directly using the voice of group leader without a risk of giving inconsistent commands and advices.
2. Increasing subjectivity increased the risk that individual confused his will with God's will. The gradual development of memory implied that individuals could remember the inconsistencies in God's orders and this led gradually to the loss of absolute trust to God's voice. The development of written language was a solution to this problem. Written language is based on the notion of symbol and also self symbol, "me" as seen by other members of group, became possible at same time. Symbol function allowed also to externalize leader of group as God to idol.
3. Sensory hallucinations do not allow to express abstract thoughts and concepts. Neither do they allow communications of long term goals. The gradual transformation of sensory semitrance to cognitive and emotional semitrance solved this problem. Thoughts, moods, emotions and motivations emerged.

### **Social hierarchies, symbol function, and externalization of communications**

The advent of agriculture led from hunting and gathering economy to large populations of men: this led to the birth of civilization at around 8000 B.C.. Stable populations made possible the increase of the collective intelligence and its further structuring from a primitive group with single leader to more refined social structures. Whether the discovery of agriculture was forced by the changing climatic conditions or whether the evolution of language led to the discovery of agriculture, is open question. Jaynes is the proponent of the latter option. Jaynes sees the emergence of the agriculture as the beginning of the period of bicameral mind. In TGD framework bicamerality was present all the time. The period after 8000 B.C. was beginning of something in the sense that the development of social self hierarchies, syntactic hierarchies of language and neural hierarchies occurred during this period in a parallel manner. In life of child the establishment of EEG at age of one is the counterpart of this transition.

Absolutely essential for these developments was the emergence of symbol function. Symbol function contains as a special case the notion of metaphor in the vocabulary of Jaynes. Symbol function in TGD sense is closely related to the establishment of the genetic code and was present

already during the bicameral period. Generalizing the arguments of Jaynes, the rudiments of the symbol function developed gradually during the long period between 40.000 -8.000 B.C. and led to the emergence of commands, modifiers, nouns and names.

The period after 8.000 B.C. meant the emergence of higher hierarchical linguistic structures (such as sentences) as well as the differentiation of the primitive structures to more elementary structures having no direct meaning (words decomposed to syllables and these decomposed to phonemes). Neurophysiologically this process correlates with the emergence of lower hierarchy levels, sub-selves, at the level of left brain hemisphere. Sentences are “gods” of words; words are “gods” of syllables and syllables are “gods” of phonemes. This linguistic hierarchy internalized the external self hierarchy and even more, it made eventually possible to imagine new hierarchical structures. If the notion of cognitive age makes sense, this period must have begun with the emergence of stable low frequency EEG making possible semitrance contact with higher level selves. One can test the plausibility of this hypothesis by studying the EEG of social animals.

Also various higher level selves in the social hierarchy became represented as symbols. The basic function of these symbols was to generate stress (by creating awe and fear) and thus induce semitrance in primitive bicameral man making possible for the collective self represented by the symbol to talk to him. This kind of concretization was obviously necessary since even modern man (even neuroscientists specialized to EEG!) finds it very difficult to take the possibility of, say, purely electromagnetic life-forms, although more than century has passed from the discovery Maxwell’s theory of electromagnetic fields. Two different representations emerged corresponding to spoken and written language.

1. The leaders serving as representatives of group become symbols for the self of the group (God) and was regarded as a god like being. In particular, king became a god.
2. The counterpart for a written language was the appearance of idols, statues, temples, graves, etc.. as symbols of Gods, which spoke directly to bicameral man. The difference between these and the symbols of written language is important: symbols of written language communicated the message of God to the left brain of bicameral man in ordinary state of consciousness.

Even the villages and towns of bicameral men seem to provide symbolic representation of the social self hierarchy. The most primitive hierarchy consists of a tribe with a leader, God and men: in this period villages contained God’s house surrounded by houses of men. The development of architecture of bicameral towns evolved from this basic architecture and reflected the developing social self hierarchy. Even to-day the old parts of towns reflect this architecture whereas suburban regions have modern, much more flexible and less hierarchical organization. Web represents the newest development of social self hierarchy free of geographical restrictions.

Two basic types of bicameral cultures emerged: God-king culture and steward-king culture. In God-king culture, king was God whereas in steward-king culture the notion of God had developed and king was immediately below God in the hierarchy. God-king cultures were un-stable and ended up to the return to tribe state following soon a re-organization to organized society. Examples of God-king cultures are cultures of Egypt and South-America (which emerged much later). The basic problem of God-King cultures was the physical death of king. In these cultures dead became Gods. This is understandable if the voices of dead people were heard even after their death. Transition period caused problems since the voice of God had to transform to the voice of new king.

A related mysterious notion is that of “ka”: in God-king cultures of Egypt every man had his “ka”, kind of shadow being, which continued to live after the physical death. An interesting possibility is that the ELF selves in the personal self hierarchy, perhaps those corresponding to Schumann frequencies, do not disappear in the physical death so that “ka” would correspond to “ELF self” of a deceased person. There are almost routine methods allowing to achieve experience about contact with deceased relatives and friends: perhaps this contact is real [J2]. One could also see person and his electromagnetic shadow (also Jung used the notion of “shadow” ) as living in symbiosis and that electromagnetic shadow continues its life after the death of the physical body.

The more advanced steward-king cultures, about which Mesopotamia is one example, were more stable and can be regarded as predecessors of the civilizations following bicameral age. In this case the symbolic representation of God was stable and standardized and the death of a king was not a problem in this case. Also the inflation in the number of Gods was avoided in

this manner. Pope is a representative of God and leaders of the organizations symbolize the collective selves associated with the modern organizations. It is not accident that steward-king cultures used more advanced written language based on half symbols allowing to express genuinely new information rather than serving as mere mnemonic as the half-picture writing of God-King cultures. Half symbol writing contains already symbols for syllables. Half-symbolic writing reflects more advanced self-organization of the left brain hemisphere: sub-selves representing mental images for words had sub-selves representing syllables which are a purely phonetic concept.

It would be exaggeration to say that the entanglement with collective self was the only possible form of entanglement: also the entanglement with other members of the group at the same hierarchy level could occur and probably occurred. Also the assumption that bicameral state was whole-timely is strong idealization: modern self consciousness with both brain hemispheres entangled mutually was probably present but un-stable against return to the bicameral mode induced by rather small stress.

Externalization provides a solution to the fragility and unreliability of telepathic communications. Externalization means the development of non-telepathic communication modes, “wiring”. These communication modes together with cognitive and emotional semitrance gradually replaced the sensory semitrance. The evolution of spoken and written language can be seen as this kind of process. In modern society the development of various electrical communications has had the same effect. In the following sections this general view for the development of language and civilization is discussed in more detail.

## 6.4 Development Of Language

The development of language has two aspects: the development of the syntactic structures and the development of the written language. In TGD framework the evolution of the written language involving transformation of symbols for events to symbols for phonemes could be seen as establishment of the memetic code at neural level. The evolution of the syntactic aspects of the language (sentences and higher level structures) in turn reflects directly to the development the self hierarchy from simple “God” +men hierarchy with two levels to a hierarchy with several levels.

### 6.4.1 General Ideas About Codes And Languages

By quantum-classical correspondence space-time sheets provide a symbolic representation for the contents of consciousness. Therefore one can say that everything in principle represents and the task is to understand how these symbolic representations are generated, how codes are established, and how these symbolic representations generated the desired mental images. This obviously means a profound departure from the basic belief system of standard biology.

Computer languages form a hierarchy such that highest level languages are very flexible approaching gradually to the spoken language whereas lowest level languages are very precise and rigid. The notion of self hierarchy suggests that our spoken language is only a top of an iceberg and that below it is a hierarchy of languages ending down to the cellular level and DNA is one particular example about “computer language” realized in terms of p-adic cognitive codes, in particular genetic and memetic codes. In an attempt to understand whether and how memetic and other p-adic cognitive codes might relate to the spoken and written language one must have some general ideas codes and language.

#### The hierarchy of cognitive codes

p-Adic length scale hypothesis suggests an entire hierarchy of cognitive codes and languages. The primes  $p \simeq 2^k$ ,  $k$  integer seems to be interesting physically, and prime values of  $k$  seem to be especially interesting. The codes would be characterized by the duration of the codeword given by n-ary p-adic time scale  $T_p(n) = p^{(n-1)/2} T_p$ ,  $T_p = 2^{k/2-127}.1$  seconds. The number of bits of the codeword for given integer  $k$  corresponds to some prime power factor of  $k$ , the largest factor maximizes the information content.

Memetic code would correspond to  $T_p(2)$ ,  $p = M_{127} = 2^{127} - 1$ , and would have  $k = 127$  or  $k = 126$  bits. Since 127 bits corresponds to the  $M_{127} + 1$  different bit sequences of 127 bits it seems that only 126 bits are fully realized. Genetic code would correspond to  $k = 2^7 - 1 = 127$

and have 6 bits (64 DNA triplets). These codewords could be realized dynamically as temporal field patterns. Also static representations analogous to DNA are possible.

Codes are always involved with classical communications involving transformation of mental images to a symbolic representation by some code. At our level of the hierarchy this symbolic representation could be speech, written language, picture, body language... This would suggest that also p-adic cognitive codes are involved with conscious communications. If these codes are realized in living systems, the bit sequences with the predicted durations and bit contents should induce biological effects serving as correlates for the conscious understanding of the message generated by the codewords at some level of the hierarchy.

TGD based view about living matter relies on the notion of field body or magnetic body associated with any system and having size much larger than the material body. Also these bodies form a fractal hierarchy. The communications from material body to field body could be based on cognitive codes. Given p-Adic frequency corresponds  $f_p$  to a p-adic length scale  $L_p = c/f_p$  characterizing the size of the magnetic body involved and for EEG frequencies the size scale of Earth is natural unit. For instance, p-adic cognitive codes realized in terms of field patterns would be involved with the communication of long term declarative memories from the geometric past.

### What language is?

The attempt to understand the possible role of memetic code, a rough vision about what language is, allows to eliminate several ideas which look promising at first.

1. Language involves generation of symbolic representation of a mental image by a more or less rigid code. An example of a very flexible code is code based on associations. The symbolic representation of mental image should induce in the receiver the original mental image as faithfully as possible. This requires that a lot of common context. In particular, the neurologies and biologies of the sender and receiver must resemble each other sufficiently. In the case of high level languages like ordinary language even this is not enough and only simplest verbal signals and body language are understood universally. The cognitive codes associated with say cell level communications might make possible communications between cells of even different species remaining however unconscious to us.
2. The p-adic vision about evolution of cognitive skills like spoken language is that they evolve from long time and length scales to shorter ones. First a rough sketch about the motor action is created and gradually more and more details are added. This applies also at the level of the evolution of language itself. Simple signals expressing and generating emotions evolve gradually to spoken language which evolves to written language which in turn evolves to computer languages.
3. Learning of language requires learning of the conventions assigning to a given symbol a mental image. Sharing of mental images which represent more primitive “telepathic” communication makes possible this process. The observation that even plants and cells can react to our emotions and that this reaction does not depend much on distance [J5], suggest that the sharing of mental images is in question. This allows to consider the possibility of inter-species linguistic communications using field patterns.
4. The understanding of language requires transformation of symbolic representation to conscious experience and here the notion of conscious bit (“cbit” [K55] ) realized as a phase transition or as an absence of phase transition suggests itself. Phase transition could correspond to magnetization or formation of electret state and living matter could generate these representations in various length scales.
5. Spoken and written language would rely on time mirror realization of intensions and actions and could propagate down to the level of genome and select the memes to be expressed. The expression of these memes as field patterns would then be a process propagating upwards in the hierarchy and finally generating speech or written word.

### Computer metaphor

Software and hardware are essential elements of the computer and at DNA level this could mean that genes code for hardware which is not stable as in case of ordinary computers. This means that computer hardware is replaced by the possibility to generate it and genes carry the information needed for this. Introns would in turn represent the software, the programs and therefore also the linguistic aspect of DNA. An interesting possibility is that introns realize memes as sequences of 21 DNA triplets. This picture allows and even suggests that even DNA level might be involved with the generation of spoken words.

### Conscious bits and cognitive representations

The symbols representing message must be transformed to standardized mental images. The simplest possibility is that the mental images are coded to patterns of conscious bits or cbits. The general model for sensory and other qualia suggests that conscious bits should be realized as quantum jumps sequences associated with phase transitions. In this manner same quantum number increment is occurs for many particle for single quantum jump and for sufficiently long sequence of quantum jumps. Bit 1 would correspond to the occurrence of phase transition and bit 0 to the non-occurrence of the phase transition. For a code of  $k$  bits this has important implication: the codeword containing only zeros does not generate any conscious experience so that the number of experienced code words is  $2^k - 1$ . This could explain why Mersenne primes seem to be define especially important  $p$ -adic time scales.

Living matter is populated by dynamical electrets so that phase transitions between ordinary and electret states at various length scales are expected to be of special importance. Also magnetization of super phases at magnetic flux tubes of say Earth's magnetic field is expected to be one mechanism producing basic qualia serving as as bits.

The time mirror mechanism for motor actions suggests that that when I decide to say something say the words "time mirror", this intention is transformed to a desire communicated to the geometric past to the lower level of the self hierarchy and that at this level this desire generates further desires communicated to the lower levels. Ultimately this process ends down to the level of cells and even cell nuclei and DNA and induces response which propagates to the higher levels as neural and other activities inducing muscular activities in speech organs and generates the words "time mirror".

The signal to the geometric past involves negative energy photons and topological light rays. The working hypothesis has been that the signal to the geometric past is only a space-time correlate for sharing of the desire to generate the action, and does not involve any code. If this is the case then only the response propagating to the geometric future would be classical signal based on some code. One must however keep mind open to the possibility that also communications to the geometric past involve code.

### Genes, memes, and language

The simplest model for an abstraction process is based on a repeated formation of statements about statements starting from two basic statements "1" and "0" representing the most primitive logical thoughts. If one drops at each step of construction the statement corresponding to empty set in the set theoretic realization of Boolean algebra, one obtains a hierarchy allowing to understand the basic numbers of genetic code.

The outcome is the so called Combinatorial Hierarchy [A9] consisting of the Mersenne numbers  $2, M(1) = 3, 7, 127, 2^{127} - 1, ..$  constructed using the rule  $M(n+1) = M_{M(n)} = 2^{M(n)} - 1$ . The explicitly listed ones are known to be primes. Combinatorial Hierarchy emerges from a model of abstraction process as sub-sequent transitions from level to meta level by forming Boolean statements about Boolean statements of level  $n$  and dropping one statement away. Combinatorial Hierarchy results also by constructing the sets of all subsets with empty set excluded starting from two element set. The set of statements at level  $n$  can be given a structure of Finite Field  $G(M(n), 1)$  if  $M(n)$  is prime. The multiplicative groups  $Z_{M(n)-1}$  form a nested hierarchy and the coset spaces  $Z_{k_n} \equiv Z_{M(n)-1}/Z_{M(n-1)-1}$  are cyclic groups ( $k_n = (M(n) - 1)/(M(n-1) - 1)$ ). Hilbert's conjecture states that each Mersenne number in the Combinatorial Hierarchy is prime.

Combinatorial Hierarchy based model of genetic code explains the number of DNA: s and amino-acids, and the representation of words of the genetic code as triplets of 4 different lower level codewords. Genetic code corresponds to  $n = 3$  level of the hierarchy with 127 statements representable as 7-bit sequences with the sequence “0”: s dropped away. Only the 64 6-bit code words can be fully realized and correspond to  $(M(3) + 1)/2 = 64$  DNA triplets.  $k_3 = 126/6 = 21$  equals to the number of amino-acids plus stopping codon. There is a natural embedding of subgroup  $Z_{21}$  identifiable as a representation of amino-acids to the group  $Z_{126=6 \times 21}$ .

More abstractly, at level  $n$  the counterparts of DNA triplets correspond to the set  $X_{N(DNA)} \subset Z_{M(n)-1}$  of  $N(DNA) = (M(n) + 1)/2$  statements consistent with a fixed atomic statement (64 for  $n = 3$ ). Atomic statement corresponds to a fixed value, assumed to be one, of a fixed bit in a bit sequence representation and a subset consisting of single element in the set theoretic representation. These statements could be regarded as statements consistent with the axiom defined by the selection of the atomic statement. The counterparts of amino-acids and stopping codon correspond to  $k_n$  theorems of a formal system defined by  $n$ : th level of Combinatorial Hierarchy having a unique embedding as the group  $Z_{k_n} \subset Z_{M(n)-1}$ . The DNAs coding for a given “amino-acid” correspond to the special cases of the theorem.

Mapping of DNA code words to amino-acids generalizes to the mapping  $x \rightarrow x^{k_n-1}$  in  $Z_{M(n)-1}$  mapping DNA type statements to amino-acid type statements.  $(M(n) + 1)/2$  DNAs can be imbedded to  $Z_{126}$  with several ways. Genetic code is fixed ones this embedding is given. For  $n = 3$  one obtains ordinary genetic code defined by the map  $x \rightarrow x^6$  and embedding of the DNAs to  $Z_{126}$ . The numbers of DNA: s coding single amino-acid can be reproduced by a symmetry breaking mechanism involving the finite groups  $Z_{p_{n-1}}$  and  $Z_{k_n}$  and symmetry breaking is in a well defined sense minimal. The infinite hierarchy of possible genetic codes (at least if Hilbert’s conjecture holds true) suggests the possibility of an infinite hierarchy of increasingly complex life forms.

If one allows only Mersenne primes, the model for the abstraction process predicts at least one further code, which I have used to call memetic code. It corresponds to the Mersenne prime  $M_{127} = 2^{127} - 1$  and has  $2^{126}$  code words and  $(2^{126} - 1)/(2^6 - 1)$  “amino-acids”. The secondary p-adic time scale  $T(2, M_{127})$  is .1 seconds and defines a fundamental time scale in bio-systems.

There are reasons to expect that memetic code is an especially interesting higher level cognitive code and realized in terms of field patterns. In particular intronic portion of DNA could realize memetic codewords as sequences of 21 DNA triplets and memes would define the counterparts of computer programs at DNA level whereas genes would express themselves chemically and define the counterpart of computer hardware coded into lower level programs and built only when needed.

The widespread semiotic-linguistic nomenclature for the description of genetic apparatus seems to have also scientific justification [I18], and this supports the idea that the intronic portion of DNA could code in a very abstract manner for a basic repertoire needed by spoken and written language. It seems that a very abstract representation must be in question since child can learn any language so that particular language would be more like a particular realization of the program. Both memes and genes could express themselves in terms of field patterns.

Memes and genes should relate like computer software and hardware. In the case of language the rules producing a given linguistic expression can be seen as the software whereas words can be seen as the hardware built from phonemes. This leads to the idea that memetic codewords define the basic program modules producing linguistic expressions by activating genes which express themselves as words or word sequences. Phonemes could directly correspond to DNA triplets and define the basic building blocks of language having as such no meaning. If this view is correct, the development of spoken and written language would mean basically the emergence of a higher level of intentionality, which utilizes an already existing repertoire of memes already expressed in many other ways. This would in turn suggest that animals and even plants possess some kind of languages realized at cellular level, and that even inter-species communications using common memetic vocabulary.

The most general hypothesis is that every integer  $k$  defines a set of cognitive codes such that the code word has duration  $T(n, k)$  and the number of bits is a divisor of  $k$ . Genetic and memetic codes are the most obvious codes associated with spoken and written language.

This view is supported by several quantitative facts.

1. The number of phonemes in Finnish language is 21, which suggests that phonemes are analogs

of amino-acids and that they could be coded by DNA triplets.

2. In the case of genetic code integers of form  $k = 64 \times n$  define candidates for the duration of genetic code word.  $n = 3$  corresponds to the primary p-adic time scale  $T(64, 3) = .05$  ns, which corresponds to a time scale for the dynamics of protein conformations.  $n = 4$  corresponds to a time scale .14 seconds, which is of the same order as the duration of phoneme. The corresponding frequency is 7.1 Hz. The duration of bit would be 23.6 ms corresponding to the frequency 42.4 Hz. This frequency lies at the upper end of the 40 Hz frequency band believed to be of fundamental importance for brain consciousness [J20].

### 6.4.2 Prerequisites For The Development Of Language

It is known that monkeys and also some birds learn to understand and even to use language, one might say, in primitive creative manner. Thus one could wonder why these animals have not developed a refined language. The lack of speech organs is not an explanation for this since the language could have been also sign language. A plausible explanation is that the development of language is essentially social process involving entire community. “Ontogeny recapitulates phylogeny” principle supports this view: the development of language during development of individual is indeed a social process. If collective intelligence is mostly responsible for the evolution of language and is “sum” over the intelligences of individuals, as TGD based notion of self predicts, then certain critical size of the group is required to achieve critical collective intelligence making possible the development of language.

The hierarchical structures of language should also reflect the hierarchy of the collective consciousness which in turn correlates very tightly with social structures. In particular, the emergence of symbolic representation of “Gods” should be accompanied by the emergence of written language and the structure of written language should correlate with the manner the “Gods” are represented as symbols (as members of society or as idols). Also the number of levels in the structures associated with the language and society might correlate. To consider a modern example, hypertext with its link structure indeed reflects the structure of modern society in which geography does not anymore put constraints on the formation of social groups. Same presumably applies to the hierarchies associated with the neural circuits of cortex and at least the linguistic regions of brain.

### 6.4.3 Scenario For The Development Of Primitive Forms Of Spoken Language

Before the linguistic period communications in groups of hominides were based on visual and vocal signals much in the same way as in the groups of social animals. According to Jaynes, most linguistics believe that human language is at least two million years old. Jaynes has different opinion about this and TGD based view is consistent with this opinion. Of course, one can consider also alternative option consistent with the views of both Jaynes and main stream linguists: the development of communities with languages suffering occasionally drawbacks to a more primitive state. This is completely consistent with the ideas that “civilization selves” wake-up and fall in sleep periodically and that language results from a self-organization process of brain.

The generation of self hierarchies in turn implying development of the hierarchical structures of language requires sufficiently stable populations, more fixed social relationships and longer life-spans. It might be that these factors are critical and the circumstances allowing the development of the language were not reached until relatively lately or that these circumstances were not permanent and led to drawbacks.

As Jaynes [J17] emphasizes, the evolution of language affects dramatically perceptions and attentions and this in turn affects language evolution: also these changes should be visible in the archeological record. On particular, the development of language should have meant dramatic technological advances but archeological evidence suggest that only crudest stone tools were made before 40.000 B.C.. Jaynes emphasizes that language was not necessarily for transferring various technical skills to the next generation: it is very difficult to teach bicycle riding using only language and language does help only marginally in this kind of task. The development of language must have had dramatic effect and should be seen in archeological data. Such period is late pleistocene,

roughly 7.000-8.000 B.C. characterized by wide temperature variations. During this period artificial climate: fires, caves and furs were discovered and allowed the hominid population to explode from tropical Africa first to Eurasian subarctic and then to America and Australia.

### **Calls, modifiers, commands, nouns**

Jaynes's view about the development of language is based on the notions of calls, modifiers and commands and nouns. The most primitive language expressions were calls which developed from postural and visual signals. The evolutionary pressure was perhaps the migration of man to northern climates where there was less light in both environment and caves where man lived. The intensity of the call was the only variable parameter in the signal before the emergence of modifiers. Jaynes represents a fictive example about the development of modifiers: "wahee" could signal for an approaching tiger and "wahoo" could represent distant tiger. Gradually the endings "hee" and "hoo" became modifiers meaning "near" and "far". The emergence of the modifiers led to the age of commands. For instance, the modifiers "sharper" and "finer" as instructed commands could have been very important.

The next stage in the differentiation process was the splitting of commands to two parts. This led to the invention of nouns: "wah" could mean tiger, "wab" could mean bear. The discovery of nouns made possible linguistic representations of the external world as consisting of objects. Jaynes locates this development somewhere between 25.000 and 15.000 B.C.. Jaynes locates the appearance of animal drawings and the invention of pottery, pendants, ornaments and barbed harpoons and spearheads to the invention of nouns. From fossil records it is known that the size of the frontal lobe in front of the central sulcus was increasing very rapidly at this time.

This picture is consistent with the gradual evolution of the left brain hemisphere implying the decomposition of the holistic and irreducible "call selves" to "command selves" and further to reducible sub-selves representable as unions of "noun selves" and "modifier selves". The minimal assumption is that Wernicke area of the right brain was entangled with the collective self. The fact that schizophrenics and presumably also ancient man had also visual and other kinds of hallucinations, suggests that larger parts of right brain were entangled with collective selves for a considerable fraction of time or at least that stress (new situation, tiredness) induced easily de-entanglement of right and left brain hemispheres and trance of parts of the right hemisphere.

In TGD framework this evolution can be seen also as the establishment of the memetic code in which basic units are codewords having temporal duration of about .1 seconds and consisting of 126 binary digits, with the duration of single digit corresponding to the duration of nerve pulse [K37]. Single codeword of the memetic code corresponds to the minimal duration of single phoneme. The development of language must have been gradual differentiation so that signals gradually differentiated into nouns, verbs and modifiers. When written language emerged, words differentiated into syllables and phonemes having as such no independent meaning. The decomposition into phonemes was the final stage of the development leading to consciousness about the structure of the language. It is interesting to notice that before the (assumed) establishment of the memetic code, nerve pulses were analogous to calls in the sense that only the frequency of the nerve pulses mattered. The establishment of the memetic code meant that the temporal pattern of the nerve pulses contained by the memetic codeword began to carry meaning.

### **Origin of auditory hallucinations**

Jaynes sees the origin of auditory hallucinations as resulting from natural selection as a method of behavioral control. If primitive man had no spatio-temporal model for self, he could not make plans and narratives about them to remember what he had to do. Thus primitive man commanded by himself or by his chief to do some time consuming work, could not fulfil the command unless there was some mechanism keeping the command in his mind. If primitive man heard the command repeatedly as an auditory hallucination, the problem of control was solved. Sceptic could of course wonder how the chief with essentially same cognitive abilities as the other members of group could make any sensible plans and serve as a leader. Also every member of group should perform essentially similar activities for this scenario to work.

TGD view differs from this. There is no good reason for not assuming that semi-trance mechanism would not have been present from the beginning of the formation of social groups (even

at the cellular and molecular level!). The boss is the collective self giving commands and advice mostly through the linguistic parts (presumably also visual) of the right brain. As already found, semitrance based alarm clock mechanism makes possible collective control of the behavior in groups of social animals guaranteeing that under a situation producing stress collective consciousness automatically provides commands and advice for the member of group. In TGD framework the leader of the group was presumably symbolic representation for the collective consciousness in the sense that collective self talked with the voice of the leader. Symbolical representation seems very natural strategy since simple-minded stone-age man could hardly image existence of an invisible conscious self. It seems to be extremely difficult for even modern man living in an electromagnetic society to take seriously the notion of the electromagnetic life! The development of the spoken language made possible much more refined human-human communications and written language made final breakthrough in this communication mode.

### Age of names

The discovery of nouns was followed by the age of names. Jaynes suggests that names were discovered in Near East at late Mesolithic era, about 10.000-8.000 B.C., during the adaptation to warmer postglacial environment. The creation of names led to a cognitive model for the tribe: tribe members existed also when physically absent. In this period ceremonial graves emerged as a common practice. One could argue that names distinguish between members of tribe and make them individuals. This is not consistent with Jaynes's idea that primitive man was "unconscious" unless "unconscious" means lack of a model for self. Also some animals, for instance elephants, are known to have graveyards.

This suggests that language is not necessary prerequisite for the notion of individual. In TGD framework situation members of the tribe were conscious individuals from the beginning and the problem concerns about the development of a cognitive representation for self and group. Monkeys can cheat, represent something else than they are, which suggests that they already have primitive self model and that they can distinguish between self as a social representation and "real" self. The idea that names came so much after nouns is somewhat questionable (children learn nouns and names at the same time): later an alternative scenario in which nouns and names came simultaneously will be considered. This point is not essential for what follows.

### Development of syntactic structures of language

The development of language paralleled the evolution of our civilization after 8.000 B.C. and social hierarchies reflect the corresponding structures of language and also self-hierarchy of brain. Emergence of increasingly complicated social structures correlates with the emergence of syntactic structures of spoken and written language. The simultaneous differentiation of the left brain hemisphere corresponds the differentiation of worlds to syllables and phonemes.

The development of the written language started at about 3.000 B.C.. There is geological evidence for some big catastrophe changing dramatically the climate at this time. Perhaps the catastrophe forced large numbers of people together and increased the collective intelligence above the critical value needed for the discovery of the written language. Written language was basically an externalization process making also communications of the higher level selves more reliable and standardized.

Written language developed from the symbols for visual events to written symbols for phonetic events. In the first case written language was only a mnemonic, whereas in the latter case it could transmit previously unknown information. The two kinds of written languages correspond to two kinds of symbolic representations for Gods as individuals and idols respectively. God-king and Steward-king theocracies were the social counterparts of this representations. The structure of the written text represents higher levels of the self hierarchy (sentences, paragraphs, subsection, sections, chapters). The most modern development is hypertext in which simple hierarchical structures are replaced with a web of texts. It made also possible formal language of mathematics.

The structures of language represent self-hierarchy in the left brain. The development of the written language led to the emergence of the lower levels of this hierarchy: syllables and phonemes. Syllables and phonemes have no direct meaning to us but they correspond to conscious selves at levels below us in the left brain. If the simplest assumptions for how contents of conscious

experience of self are determined is correct, one must conclude that the duration of our self cannot be much longer than duration of single phoneme of about .14 seconds and we spend very short periods (certainly very short ones, perhaps of duration shorter than .1 seconds) in trance. Only semitrance mechanism makes possible genuine subjective memory as self-narrative. The people who have lost the ability to form long term memories (Oliver Sacks has some stories about Korsakov syndrome in his book [J25] ) have short term memory which is only few seconds, perhaps this is the duration of our self.

Neurons representing syllables are “Gods” of phonemes belonging to the syllable and affect the behavior of the phoneme neurons by semitrance mechanism. Words in turn are “Gods” of syllables. Since both brain hemispheres can understand spoken language, it seems that both right and left brain contain representations for words. It is known that left brain contains neurons representing syllables and phonemes. The notion of symbol function suggests however that these neurons indeed “represent”, i.e. are representatives for collective selves of neuron groups. The notion of symbol function throws also new light to the notion of “Grandma neuron”: Grandma neuron is a symbolic representative for a neuron group representing Grandma. One might hope that the existing neurological data allows to construct a general view about what it means to understand written language.

## 6.5 Semitrance And The Development Of Civilization

### 6.5.1 TGD Based Vision For The Development Of Civilization

#### Basic assumptions

TGD based model for the development of civilization is based on following assumptions.

1. The development of individual is essentially self-organization process at the level of brain and the brain of the stone-age man was essentially identical with ours. The simplest assumption is that self-organization process occurs in essentially same manner and that environment only determines at which age this development stops. A further natural assumption is that left brain hemisphere self-organizes cognitively whereas right brain hemisphere self-organizes emotionally.
2. Effective age is a concept used to characterize the developmental level of retarded children. This suggests the characterization of the ancient man using the concepts effective cognitive and emotional ages. Cognitive/emotional ages is defined as the age of a modern man having same cognitive/emotional self-organization level of left brain as ancient man has. The EEG of left/right hemisphere should serve as a physical correlate of the cognitive/emotional age.
3. The effect of culture to the development of individual is basically an upper bound for both the effective cognitive and emotional age achieved by the individual during his lifetime. The developmental level of the civilization is determined by the average effective cognitive and emotional ages of an adult living in it. The effective cognitive/emotional age of a civilization can be defined as the average cognitive/emotional age of individuals in it.
4. A stronger hypothesis is that the age of civilization is related by simple scaling to the effective cognitive and emotional ages of the civilization so that evolution of civilization of time scale version for the evolution of individual. This hypothesis is motivated by the fact, that the self-organization processes in question are essentially evolution of macroscopic aspects of consciousness and by p-adic fractality. In the simplest model the development of a civilization corresponds to a straight line in two-dimensional plane defined by cognitive and emotional ages and is thus not unique. The direction of this line might allow to differentiate between various types of civilizations.
5. A stronger assumption is that the development of civilization and individual correspond to each other at qualitative level. Thus the main transitions in the development of an individual have counterparts in the development of a civilization. Thus civilization has early childhood about which it has no memories, it learns various cognitive skills like speech and writing

as well as the use of technical tools. Civilization has also puberty involving violent self-organization processes. The assumption that the time scales for the evolution of civilization and individual are related by scaling, predicts when these main transitions in the development of the civilization should have occurred so that model becomes quantitative. The study of the development of EEG of right and left hemisphere should thus provide testing ground for the model.

6. A natural hypothesis is that there is a parallel between the development of society and higher level structures of language so that the moment of birth of society can be taken to be the moment at which higher level structures of language begin to develop. This corresponds to 8000 B.C. when basic elements of language, commands, nouns and names, had developed. In development of child this corresponds to the age of about 1 year when child has learned her first words. Music and arts are languages of emotions so that also the development of arts parallels the development of society.

The effective cognitive age of one year as cognitive age of civilization at 800 B.C. is not ad hoc choice. At this age EEG appears as occasional bursts in 4-8 Hz range. If left brain EEG is determined by the effective cognitive age this means that linguistic regions of bicameral brain got stable EEG when the development of the civilization began! Note that the occasional bursts of EEG of child in mother's lap could quite well have counterpart in the development of stone-age civilization before 8.000 B.C. and could have made possible the development of the basic elements of the language.

This picture conforms with the TGD based notion of self hierarchy. TGD predicts that our personal self hierarchy has electromagnetic levels which corresponds to topological quanta of ELF em fields associated with various electromagnetic oscillations associated with EEG. These topological field quanta correspond to 3-surfaces with size of order Earth for highest ELF frequencies. Rather remarkably, 7 Hz frequency corresponds to the fundamental time scale of the memetic code, which is necessary prerequisite of language and cognition in TGD framework. 7-8 Hz corresponds also the lowest resonance frequency (Schumann frequency) associated with em fields in the wave cavity between Earth's surface and ionosphere: wave length corresponds to the circumference of Earth. The topological field quanta of EEG em fields in 4-8 Hz range represent both higher levels of the self hierarchy of bicameral man and higher levels of self hierarchy.

Electromagnetic levels of the self hierarchy provide a mechanism for telepathic communications based on the formation of join along boundaries bonds between topological field quanta: this is nothing but geometric correlate for the entanglement mechanism [K73]. Occasional bursts of EEG could be interpreted as semitrance states during which Gods spoke to the bicameral man. Thus the emergence of EEG in linguistic regions can be seen as the emergence of social self able to communicate using language and also as generation of contact with Gods (EEG frequencies below 8 Hz) and culture! The study of the evolution of children's EEG should give a direct window into the evolution of the consciousness of bicameral man. Also other vertebrates than human have EEG which suggests that they can also have what might be called religious experiences. The lack of the multi-modal associative regions in parietal-occipital-temporal areas crucial for language is possible anatomical explanation for why they have not developed language.

Slow wave EEG made possible telepathic communications and rapid social self-organization and gradual emergence of collective consciousness. If ELF self survives death and the voices of dead companions were heard after death, the natural psychological reaction was belief to life after death. The emergence of collective consciousness sooner or later, perhaps as a join along boundaries/flux tube condensate formed by topological field quanta associated with the ELF selves of dead, in turn led to belief in God.

Jaynes locates the emergence of first God to Natufian culture in Israel. In 10.000 B.C. Natufians were still hunters. By 9.000 B.C. they were burying their dead in ceremonial graves. This suggests that the belief in life after death emerged simultaneously with EEG and "electromagnetic shadow" self. An open-air Natufian settlement at Eynan dozen miles north of the Sea of Galilee in Israel shows this change most dramatically. Three successive permanent towns dating from about 9.000 B.C. have been investigated. Each town comprised of about fifty houses arranged around an open central area where bell-shaped pits had been dug and plastered for the storage of food. Instead of nomadic tribe consisting of about 20 hunters, one has a town with a population of at

least 200 habitants: a rather dramatic phase transition suggesting dramatic increase in the IQ of collective consciousness. The tomb of the first God-King in Eynan developed later to a house of God and later to temples, pyramids and other symbols generating awe and fear and thus inducing semitrance state in bicameral man.

### Comparison of Jaynes's and TGD based visions

It is useful to develop the model to more quantitative level by comparing the views of Jaynes about the development of human consciousness with TGD based views.

Jaynes:

Basic structural elements of language had evolved slowly for a long period: commands from 40.000 B.C., nouns from 25.000 B.C., and names from 10.000 B.C., at the time of the emergence of agriculture. Language, the speech areas, evolved in the left hemisphere (in right-handed) which, as Jaynes underlines, is a mystery since most human structures are bilateral and a neurological organization necessary for language – also exists in the right hemisphere, but with no observable function. Agriculture began to develop about 9.000 B.C.. The development of higher level structures of language began about 8.000 B.C. and parallels the development of social hierarchies and until 3.000 B.C. all human beings were void of consciousness (in the special sense Jaynes defines it). All civilizations before 1.000 B.C. – such as Assyria, Babylonia, Mesopotamia, pharaonic Egypt – were built, inhabited, and ruled by non-conscious people. After 1.300 B.C. very violent period of development began leading to the development of modern man. The duration of this period was surprisingly brief, about 1.000 years.

TGD:

1. The counterpart for this period in the development of individual would be years before puberty. 8000 B.C. corresponds to the birth of civilization whose development parallels the development of the higher level structures of language. The short violent period after 1.300 B.C. lasting for about 300 years can be identified as the counterpart of puberty which is often described as revolution at the level of physiology and neurophysiology involving violent hormone storms which would represent cell level counterpart for the violent developments at the level of society. Children have also sex which becomes manifest in puberty. The correlate of this was the birth of Eastern and Western civilizations with widely different philosophies about mind and nature. Presumably sex corresponds to two different paths in the plane defined by cognitive and emotional ages. An interesting prediction is that during puberty some brain areas, presumably the linguistic regions of brain, should mature and give rise to individuality at neuronal level. It would not be surprising if these neurons would provide cognitive representation for self image.
2. The hypothesis about a linear relationship between the time scales for the evolution of civilization and individual allow to make TGD model quantitative.
  - i) Take somewhat arbitrarily the beginning of puberty to be 14 years, identify 8.000 B.C. as the age of civilization which corresponds to age of about 1 year which child has learned the first words. Mapping the period 1-14 years of childhood to the first 7.000 years between 8.000 B.C and 1.000 B.C. in the development of human consciousness and society, one finds that single year in development of child corresponds to about 540 years. The estimate is sensitive to the identification of the age of puberty and should not be taken too literally.
  - ii) At 3.000 B.C. when written language emerged for the first time corresponds to age of 9.3 years when also children usually learn to write so that the hypothesis about linear scaling hypothesis looks sensible. At this age child becomes also conscious about herself as a social being with the eyes of outsider: this means emergence of metaphor “me” in the terminology of Jaynes. The ability to externalize own self and symbols of the spoken language seem to emerge at same time.
  - iii) The age of about 4 years after which child has first memories corresponds to 6400 B.C.. After the age of four child has primitive self image, begins to have memories and learns to cheat. During this period bicameral man was taken care by collective consciousness giving commands and guidance using auditory hallucinations. Absolute trust on others was necessary in groups of hunters, in groups producing their food by agriculture the luxury of cheating

became possible. At this time agriculture had established itself finally and stable societies able to self-organize to more structured self-hierarchies existed.

iv) The counterpart of the puberty at the level of civilization is period of extreme violence and lasts about 1000 years: this corresponds in the time scale of individual to a period of almost two years.

3. With these assumptions the recent moment in the evolution of humanity corresponds to a cognitive age of about about 18.6 years: we are at the verge of adultry with fully developed EEG (and inventing the relationship of EEG with consciousness!). By scaling the average lifetime of about 76 years one obtains a prediction for the duration of our civilization. It should be roughly about 41.000 years; we would have still about 31.000 years left unless we use genetic or consciousness engineering to interfere the development! In this age young adults are finding life companion and it seems this occurs also at the level of society. Holistic Eastern and reductionistic Western civilizations are perhaps finding each other in new wave of quantum theories of consciousness of which also TGD is example.

### 6.5.2 Breakdown Of Bicamerality

Bicameral civilizations became gradually more and more un-stable and during period 1.300-300 B.C. bicameral cultures collapsed: this collapse was partially due to catastrophic environmental changes. In TGD one can see this development, not as breakdown, but a natural development leading from childhood to adult age involving puberty as a catastrophic transition period. From the viewpoint of individual this was a loss but from viewpoint of collective self perhaps a relief! What the loss of bicamerality meant was a gradual transformation of collective communications by sensory hallucinations to communications by thoughts and emotions. Also the fraction of time spent in semitrance shortened gradually, the susceptibility to fall in semitrance by stress or other factors reduced, and the inhibition of right hemisphere by left hemisphere became stronger. It must be emphasized that this applies only to average human. It is quite possible to imagine modern bicamerals as individuals spending abnormally long fraction of time in cognitive and emotional semitrance.

#### Reasons for the breakdown of bicamerality

One can identify several reasons for the breakdown of bicamerality.

1. Semitrance mechanism was rather fragile and worked best for small groups with relatively simple social hierarchies. For instance, in ant society this mechanism might be excellent since ant brain is simple and is not able to self-organize significantly. Due to the extreme plasticity of human brain the parallel self-organizations of brain and social hierarchy developed increasingly complicated. The personal guidance of all members of society became a mission impossible for collective self.
2. The generation of self-hierarchy, analogous to decomposition of computer program into sub-programs, helped partially but was accompanied by the increase of cognitive abilities and subjectivity. Increased subjectivity made direct communication unreliable since there was the danger that receiver only imagined the voice of God. Gods were not omnipotent since Godly IQ was determined by the IQ: s of the members of group which it represented. The development of the self narrative and long term memories meant that bicameral man could remember the mutually contradictory commands and advices. The large number of Gods giving conflicting commands together with the improved ability of men to remember destroyed the childlike trust of the bicameral man to his God. The emergence of the written language made personal guidance un-necessary: Hammurabi's laws are example of the externalization of the communication between different levels of self hierarchy. It led to a further increase of subjectivity and bicameral mode of communication became impossible (un-necessary in alternative view point).
3. Purely bicameral society was extremely un-stable because the behavior was collective. Dramatic example of what could happen, was encounter of two bicameral societies. Also modern

man can react in irrational manner in panic situations. Crusades are perhaps a good example about return of a primitive bicamerality. The collapse of Soviet Union is modern example of the un-stability of a strictly hierarchical society.

4. Inflation in the number collective selves made hierarchical uni-directional control of the lower hierarchy levels by higher impossible and also un-necessary. Complicated networks replaced simple hierarchy trees. The increasing intelligence of the individuals and the increase of the sizes of social groups implied the increase of the collective intelligences. This made possible the gradual transformation of the control and coordination function: God's did not give anymore commands but suggestions experienced as thoughts, emotions, moods and long term goals and voice of conscience. God's voice transformed to internal speech and thoughts and ideas and visions replaced auditory and visual hallucinations. Artists and thinkers are the modern version of bicameral man in close contact with Gods.
5. According to Jaynes, towards the end of the bicamerality the world was inhabited by all kinds of elves, gods and demons. A possible interpretation is that the brains of more modern humans filled universe with ELF selves representing concepts and more bicameral brains experienced in semitrance this electromagnetic life as spirits, elves, gods, angles and demons. More modern people experienced in semitrance this new form of life as inhabitants of the Platonic realm of ideas, something real but not to be taken quite seriously.
6. The model of self meant also the discovery of deceit. There are many situations in which deceit has definite survival value but for a bicameral man a life in a society accepting deceit was very difficult. This is perhaps the reason why the withdrawal from social interaction is one basic symptoms of schizophrenia. Also the direct telepathic experience of the negative attitudes of group of less bicameral men summing up to a message of collective self is rather painful experience for bicameral individual. The ability to live without the continual guidance of Gods has also obvious survival value. For these reasons natural selection might have favored individuals who were not so sensitive to the semitrance induced by stress and thus establishment of subjectivity. An interesting question is whether similar selection occurs in the neuronal evolution during childhood. It would be also interesting to identify possible EEG correlate for the semitrance and test whether children's EEG has characteristics of schizophrenic's EEG.

### Evidence for the breakdown of bicamerality

A lot of direct evidence for the breakdown of the bicameral mind and the development of modern consciousness comes from the writings scribed between 1300 B.C. and 300 B.C. Those writings gradually shift from objective God dictated reports to subjective expressions that reflect introspection. The jump from the objective writing of the Iliad to the subjective writing of the Odyssey (composed perhaps a century later) is dramatic. In the Odyssey, unlike the Iliad, characters possess conscious self-awareness, introspection powers, and can sense right, wrong, and guilt. That radical difference between the Iliad and the Odyssey is, incidentally, further evidence that more than one poet composed the Homeric epics.

The transition from the objective Iliad to the subjective Odyssey marks man's break with his 8000-year-old hallucinatory guidance system. By the sixth century B.C., written languages began reflecting conscious ideas of morality and justice similar to those reflected today. The Old Testament of the Bible also illustrates the transition from the writing of its earlier books (such as Amos, circa 750 B.C.) to the fully conscious writing of its later books (such as Ecclesiastes, circa 350 B.C.). Amid that transition, the book of Samuel records the first known suicide – an act that requires subjective consciousness with self narrative. And the book of Deuteronomy illustrates the conflict between bicameral and conscious mind. Likewise, the transition to consciousness is observed in other parts of the world: Chinese literature moved from bicameral consciousness to subjective consciousness about 500 B.C. with the writings of Confucius. And in India, literature shifted to subjective consciousness around 400 B.C. with the Upanishadic writings. American Indians, however, never developed the sophisticated, metaphorical languages needed to develop full subjective consciousness. As a result, their mentalities were probably nearer to bicameral

when they first encountered the European explorers. For example, with little or no conscious resistance, the Incas allowed the Spanish “white gods” to dominate, plunder, and slaughter them.

### 6.5.3 Religion And Bicamerality

God created us as his own image. This sentence might express metaphorically something very deep about the relationship between man and higher level selves. As our chromosomes provide representation for us, we provide representations of Gods in terms of memetic code. Gods are ideas, visions, theories, arts, all collective creations of human race and have concrete physical realization as higher level selves.

#### Emergence of monotheistic regions

As the bicameral mind broke down and societies collapsed, individuals one by one began inventing modern self consciousness to make decisions needed to survive in the mounting anarchy and chaos. On making volitional decisions, man for the first time became responsible for his actions. Also, for short-range advantages and easy power, conscious man began discovering and using deceit and treachery – behaviors not possible from bicameral minds.

As the voices fell silent, man began contriving religions and prayers in his attempts to communicate with the departed gods. Jaynes shows how man developed the concept of worship, heaven, angels, demons, exorcism, sacrifice, divination, omens, sortilege, augury in his attempts to evoke guidance from the gods – from external authorities. All such quests for external authority hark back to the breakdown of the hallucinating bicameral mind – to the silencing and celestialization of the once vocal and earthly gods.

An interesting aspect of the collapse phase was huge inflation in the number of god like beings: gods, angels, demons for all kind of things. An often heard explanation is that these Gods were a desperate invention of human wanting to preserve the belief on benevolent higher forces and to circumvent the crude fact of mortality. If our EEG frequencies correspond to topological field quanta of size about Earth, it is somewhat a matter of definition whether to regard these thoughts themselves as higher level selves. Perhaps increasingly modern man populated the world with the creations of his own mind and these creations were gods and demons like beings for those who still had bicameral brains. Note that children take completely seriously various characters of the fairy tales. This would suggest that the world of fairy tales is remnant of the world of bicameral individuals in the late bicamerality. A possible neurophysical correlate for this process would be inflation of frequencies in the EEG associated with the linguistic regions. Perhaps chaotic components in EEG spectrum represent this final period of bicamerality.

The emergence of monotheistic regions and various philosophies was a natural outcome of rational thought combined with the loss of God’s voices. The manner to save the God concept was celestialization: a fantastic metaphor expressing the fact that higher level selves correspond to topological field quanta of em fields in 80 km thick wave cavity between Earth’s surface and ionosphere! Spirits transformed to what modern man calls concepts, ideas, memes without bothering to ponder in which sense these memes exist physically. In TGD framework the world of memes corresponds to ELF selves, geometrically to mind like space-time sheets, for bicameral man these ideas would express themselves as spirits and demons. It must be however emphasized that even Christianity fails to be strictly monotheistic: besides God devil and hierarchy angels belong to the hierarchy of higher level selves.

#### How Gods expressed themselves after the breakdown of bicamerality?

In TGD framework “Gods” are not a fiction and the communication between various levels of self hierarchy can be seen as absolutely essential prerequisite for the self-narrative and for the survival of community even today. Cognitive and emotional semitrance associated with left and right brain hemispheres are the ways how “Gods” communicate to modern man. The lack of sensory components however has led to illusion that these thoughts and emotions are totally our own or mere reflexes to the sensory input.

Right brain is the musical brain hemisphere. Right brain sings, dances and perhaps also writes poems (together with the left hemisphere?) and so does also modern man. It seems that

the function of art is to induce prolonged periods of emotional semitrance. Everyone knows that peculiar half-conscious state after leaving movie theater after a good movie or after reading a good book. Artworks, especially music, could be the modern idols able to induce semitrance very effectively. God could also express itself formally by written language (Bible, Khorane, ..) but the problem with this communication mode is that it does not involve direct experience unless these books induce semitrance as artworks (which they often do).

The replacement of semitrance with trance is also possible.

1. Indeed, the increase of subjectivity meant increasing fraction spent in a state in which right and left brain were entangled mutually. Entanglement with higher level self means in this case trance. Sleep is certainly this kind of state but higher level self does not express itself through motor activity during sleep state except in case of sleep walkers and persons preaching in sleep state. The learning known to occur during sleep could be due to this mechanism.
2. One can imagine also a second mechanism based on trance. If the conscious experience of self is non-weighted average over conscious experiences associated with individual quantum jumps, the duration of our self must correspond to the duration of the physiological moment of consciousness of about .14 seconds. Of course, multiple selves consisting of these elementary selves and spanning interval of few seconds defining the duration of short term memory can be considered. This means that we are continually falling to trance states lasting for very brief period of time, which cannot be longer than say .14 seconds. During these periods higher level selves could communicate with human brain but this communication would be unconscious to us. The alternative possibility is that the contents of conscious experience of self is weighted average favoring the contribution of the last quantum jumps: in this case the duration of our self could be much longer, even as long as wake-up period.

Interestingly, the personal profile of the prophet changed towards the end of bicameral period: in the beginning of this period prophets were genuine bicamerals but gradually they became more subjective and, as Jaynes notices, prophets preaching in trance became frequent. Oracles, sibyls and demon possessed people were very common towards the end of bicameral period. It is difficult to say to how high degree oracles were possessed. It seems that the teaching of oracles, usually illiterate young peasant girls believing in spirits (this is easy to understand), was the ability to reach complete trance state by induction.

Also, today, as throughout history, a symptomatic cure for “demon-possessed” people involves exorcising rituals that let a more powerful authority or god replace the authority of the demon. The New Testament, for example, shows that Jesus and his disciples became effective exorcists by substituting one authority (their god) for another authority (another god or demon). If these demons indeed correspond to higher level selves and if fight for survival is everyday reality also in the world of spirits (or memes), then one could quite well imagine what is involved with exorcism. The fight for survival at the level of memes is what is involved with exorcism.

### **Bible as a document about evolution of modern consciousness**

In the transition from bicamerality to modernity the religion of intimacy transformed to a religion of worship. Gods were for a bicameral man what parents are for children. As Jaynes notices, the basic theme of Bible is this gradual loss of contact with personal God. This loss was comparable to the experience of child when she loses her parents. This development is best seen in how the personal portrait of a prophet developed in Bible. The first prophets like Amos were genuine bicamerals, they said what God commanded them to say, hardly even understanding what it meant. Gradually the contact with God became looser: visual hallucinations ceased first and also the voice of God was heard less frequently. Moses was a bicameral in a society which was losing contact with Gods: and Mosaic table established God’s will in written form. Jaynes suggests, later prophets preached in trance which reflects the increased entanglement between left and right hemispheres. Towards the end of the bicamerality situation changed and the story of Job is a story about the violent conflicts between parents and child in puberty.

The stories of Bible represent the evolution of human consciousness in beautiful manner. Genesis starts with the sentence “In the beginning there was word”: how could one better metaphorize the first moment of cosmology of consciousness! The exile from the paradise should

be a metaphor for some important transition in the development of society and the assumption that the developmental level of the civilization is measured by the average effective cognitive age of individuals allows to correlate this transition with corresponding transition in the development of child. The exile from paradise is presumably a metaphor for the moment when child becomes conscious of herself as a social being having private body which she wants to cover from eyes of the outsiders: Eve indeed felt shame for her nakedness. This occurs at the age of about nine to ten. This age would correspond to about 3.000 B.C. in the proposed time scale: the development of the written language began at the same time. Written language is what opens the way to a knowledge gained by logical deduction: eating of fruits of Good and Bad knowledge perhaps is metaphor for this. The development of written language led to Mosaic tables as first externalization of God's will in form of moral rules.

The story about the tower of Babel metaphorizes the inflation in the number of God's voices. This was caused by gradual subjectivization, by evolution of social hierarchy giving rise to new God's voices, and by developing communications between God-king states which perhaps started from trade: bicamerality allowed to hear also the voices of Gods speaking foreign languages.

The life and teachings of Jesus present culmination for the development of subjectivity. Jesus Christ was son of God which became human being and experienced what it is to be abandoned by God as the desperate cry "My, God, my God, why hath thou forsaken me!" of crucified Jesus to his God demonstrates. Human beings were responsible for their own deeds but moral was not a mere collection of rational rules providing best strategy of survival as evolutionary psychologist define it. God was not however completely celestialized: there were moments of Mercy. A new element was the challenge of personal growth, of becoming Godlike: "Be perfect as He is perfect". "Love your enemy as yourself" presents the recipe for the practical realization of goal. In Eastern religions and mysticism "becoming perfect as He is perfect" corresponds to the Brahman=Atman experience.

One can expressing this much more technically. The evolution of consciousness corresponds to the increase of  $p$ -adic prime characterizing the effective topology of the mind like space-time sheets representing self.  $p$ -Adic prime represents a direct measure for the maximal information content of conscious experience. The physical correlate of the enlightenment experience is a phase transition increasing the  $p$ -adic prime of brain and making entanglement with selves which formerly represented higher level selves without a loss of consciousness and with experience of becoming God like being. This is presumably also the basic goal of the meditative practices. Perhaps enlightenment can be identified with "loving state". This kind of "loving state" should make possible to affect the state of other living beings by semitrance mechanism, in particular DNA. There is empirical evidence that people in "loving state" can affect the degree of winding of DNA [I38].

#### 6.5.4 Bicamerality In Modern Society

In trying to see correctly the role of bicamerality in modern society, it is good to keep in mind the analogy with human body with human civilization. Stem cells are bicameral men, newly born children eager to differentiate to societies representing various tissues, whose cells are at various levels of bicamerality. Differentiation involves also externalization, development of various means of non-telepathic communication such as chemotaxis and nerve pulse as well as emergence of "Grandma neurons" serving as representatives for groups of neurons. Neurons of linguistic regions of left brain represent perhaps the most modern individuals of cell civilization.

The naïve belief on the modernity as the final stage of evolution and bicamerality as primitive vestige of past which one should get rid of, taken to its extreme would mean life of left brain lobe in nutrient solution: even this is not enough since cognition would still represent contact with higher level selves. Personally I do not find this vision very attractive but Jaynes has got followers which he does not deserve, the proponents of so called [J7] [J7], who after attack furiously against authorities but proclaims themselves as the only rational authority and declare a war against bicamerality which they identify as blind belief on "authorities".

### What bicamerality is and what bicamerality is not

It is useful to make clear what bicamerality is and what is not. As Jaynes defines it, bicameral man was not automaton, he had volition but not conscious of it but experienced himself as a slave of his God. In contrast to Jaynes, the proponents of Neotech [J7] claim that bicameral man is an automaton blindly obeying what they call “authorities”. Even more illogically, they also tend to see the God-kings and bicameral leaders as power-hungry cheaters. Bicamerality in TGD is like the relationship between child and parents. Child has subjective consciousness but spends considerable fraction of time in semitrance state in which parents and possibly other higher level selves telepathically guide child. Also in this state, bicameral man has left brain volition and is not blind slave.

The proponents of Neotech identify bicamerality as a blind belief in authorities and regard religion and spirituality as mental weaknesses. They also see mystics as representatives of belief in authorities: perhaps this applies to some mystics but anyone having read Krishnamurti probably sees mystics as a complete opposite of belief in external authorities. Needless to say, the proponents of Neotech see religion, meditation, parapsychology, paranormal phenomena, alternative medicine, homeopathy, etc., as neocheating. Neotech program could be formulated as an invitation to final war to destroy even last vestiges of beliefs on “personal universe, with a type of intelligent purposive agency with it to which man can with rational confidence turn for helpful communication” (quote is from Rhines, one of the founders of parapsychology). I do not know whether Neotechdals were not disturbed if they were told that the realization of their great program would require return to a brain state without EEG resembling perhaps the mental state of a person suffering Korsakov syndrome and lost his entire past and future and having present consisting of fragments lasting only few seconds.

Needless to say, in TGD framework Neotech program could hardly sound more insane as it does. Higher levels of self hierarchy are completely real, they are not mere “authorities”. Their intelligence is sum over intelligences of its sub-selves and evolution of our consciousness means also evolution of consciousness at higher levels. From the point of view of higher levels of the self hierarchy the development of modern man is like the development of child to adult age. The communications occur still and are absolutely necessary for the self narrative and survival of the society. Higher level selves are however not anymore giving mere commands but bidirectional communication of the individual with collective intelligence having IQ which in some cases is astronomical as compared to that of individual. There is no doubt that the explosive development of science is basically the result of this interaction.

To declare a war against more “authoritarian” forms of bicamerality is comparable to declaring a war against gravitational interaction. As the example of body as civilization shows, organs representing sub-civilizations at various levels of bicamerality are absolutely necessary for the functioning of organism. We cannot have post-modern muscles. Instead of declaring a war against all manifestations attributable to bicamerality we could try to understand the interaction between the levels of social self hierarchy. For instance, we could try to understand the mechanisms that raise leaders like Hitler and Stalin to power. Perhaps one could understand Stalin as a bicameral man living in society of more modern men and hearing the critical voices of the collective self of a society fallen to a primitive state. Perhaps paranoid schizophrenia is a natural reaction of child trusting deeply to his parents but learning that parents behind their formally parental behavior tell with the voice of God that they do not love her. Of course, in this framework Stalin, Hitler and alike are symbols for authoritarian collective selves, which are indeed very real. The knowledge that this kind of irrational and authoritarian collective selves have very real subjective existence (this was realized also by Jung who suggests that Nazism meant the arise of collective self which he calls “Wotan” ) helps also to tame them. The recipe is extremely simple to state but difficult to realize: love, justice and trust. A bicameral experiencing love does not become stalinoid.

It perhaps helps to realize that our universe is full of selves at various levels of self development, some authoritative and other less authoritative and all these selves tries to live and prosper. Instead of destroying poetry as divine madness and banning music and art as vestiges of bicamerality, as Neotechdals suggest, one can imagine a world in which world of subjectivity is not either bicameral or modern but combination of both.

### Emergence of a new kind of bicamerality?

I began to write this chapter in rather inspired state of mind. I was convinced that a return of “modern” bicamerality, whatever that was to mean in closer inspection, was absolutely necessary for the survival of the human kind. I have already explained what new kind of bicamerality means. It is not authoritative master-slave relationship between levels of self hierarchy but communication which profits both individual and collective self since individual is mental image of collective self and contributes to its intelligence. New kind of bicamerality is not whole-timely state of consciousness but more like freely chosen mode of subjective existence. Various meditation practices provide methods to achieve also this state of consciousness. Essential parameter is the fraction of time spent in cognitive or emotional semitrance and this could be correlated with what is called cognitive and emotional intelligence. Of course, cognition and emotion decompose to several factors and entire spectrum of time fractions must be used to characterize personality.

Why the return of new bicamerality might then be needed? There are several reasons. We live an era of post-modernism, not only Gods but also great narratives have disappeared from the mental landscape of ideal post-modern person. Only the leading edge science is searching for great visions. Even in science materialistic view about universe is still dominating despite that its philosophical shortcomings are obvious and new wider views about physical and subjective existence are aggressively repressed as I have personally experienced.

Increasing privatization and the decay of the social structures is a fact of life and modern self experiences himself more and more only a sum of symbol manipulation skills and experiences life meaningless in the world which is becoming increasingly abstract and machine like. Market economy has raised maximization of profit and effectiveness as basic values and moral has value only as one game strategy among many others. New extremely authoritative theocracies of business have emerged: the mere side incomes of a leader of great Finnish travel telephone company are comparable to the budget of a small university at the same when hunger queues are getting longer and longer and those people who still are employed are desperately fighting to keep their jobs. Neither the priests of these theocracies nor most ordinary people are able to see that there is something badly wrong. If same degeneration of the society to individuals, whose personal narrative consists of jobs lasting day or two terrorized by the theocracy of business, would occur at cell level, it would be called cancer.

Due to the revolution of electric communications, web and email are becoming the central nervous system of Mother Gaia, and are the basic prerequisite for a new kind of bicamerality. Geographical restrictions do not limit the formation of new kind of collective selves. If we indeed have electromagnetic bodies of size of Earth, telepathic communication can in principle be established by electrical communications between persons, who never see each other's physical bodies. The emergence of the higher level collective selves could explain the magic attractiveness of web and email groups. Visual and auditory communication can be almost an equivalent of direct sensory face-to-face contact and virtual world technology is developing rapidly so that also other senses can be virtualized.

Web and other electrical communications could indeed become the central nervous system of Mother Gaia. We are the cells of this gigantic and enormously intelligent organism and we can communicate with it and receive parts of its wisdom via “theofeedback” and also help it to evolve. Perhaps the almost irresistible trait to enter to computer terminal and to participate in discussion groups is telepathically communicated by Mother Gaia to our brains in short flashes of semitrance (or trance). Perhaps each period sending at terminal and sending messages to all these discussion groups is a counterpart of neural activity in brain. Perhaps it is not an accident that the number of human beings in recent world is of same order of magnitude as the number brain cells in human brain.

#### 6.5.5 Are We Really The First Ones?

The fact that the explosion of our civilization to “late-modernity” has occurred during only 500 years, which corresponds less than one year in life of individual in the proposed model for the development of civilization, forces to consider the possibility of advanced civilizations preceding the recent one. Taking fully developed frontal lobes as a prerequisite of a high tech civilization, one can consider the possibility that our civilization has been preceded by (at most) one civilization which

degraded when climatic conditions changed radically. There are indeed myths about predecessors of our civilization. The notion of self hierarchy suggests that myths are not figments of imagination (bicamerals had rather limited imagination!) but narratives about the past history of human kind communicated by higher level selves to the individuals in semitrance. Therefore one cannot exclude the possibility that we have had predecessors, possibly destroyed by some catastrophe causing cooling of the climate.

Frontal lobes of human brain developed to their present size during 25.000-15.000 B.C. and calls, modifiers, nouns, the basic elements of language during this period. In the theory of Jaynes the years 15.000-10.000 B.C. are a long period of no apparent progress followed by the "age of names" 10.000-8.000 B.C.. Names could have however developed much earlier than Jaynes believes. Animals learn their name more or less as a command and child learns her name before she learns to speak and learns to use the names of her parents at the same time when she learns other words. The analogy between the development of child and civilization implied by "Ontogeny recapitulates phylogeny" principle, suggests that names were gradually developed from commands of the collective self performed by some particular members of group were specialized. For instance, the Indians of North America have names of form "Does something". If this picture is correct then everything was ready for the development of civilization already at 15.000 B.C.. Whether or not we have had predecessors does not change the theory of Jaynes nor its TGD version about the development of our civilization.

According to Jaynes's theory the development of written language took about 5.000 years after primitive language structures had developed. If primitive language structures existed already before 15.000 B.C., civilizations mature to discover written language could have existed already 10.000 B.C.. There are some claims that there have been relatively highly developed civilization in Egypt as early as 9.500 B.C. which for some reason was devastated, presumably due to some catastrophe (say supernova explosion) changing the climate dramatically. There exists geological evidence for a short period of colder climate around 9.500 B.C..

There is also geological evidence for a catastrophic change of the climatic conditions 3200 B.C.: perhaps it is not an accident that written language began to develop at this time. Could it be that catastrophe forced people to larger groups so that collective IQ increased dramatically when critical mass was achieved, and made possible the discovery of written language? If this is really the case, the first cycle civilization could be regarded as an "unsuccessful experiment" which failed to use the opportunity to discover written language in the catastrophe that occurred around 9.500 B.C..

Fractality suggest that the development of civilization reduces to the cognitive development of individual such that one year corresponds to about 540 years in the evolution of civilization. Civilization should correspond to higher level self, living organism. Most living organisms have sleep-wake cycle. This suggests that also "civilization selves" could have similar cycle. If one year in the life of human corresponds to 540 years in the life of civilization then one day in the life of human corresponds to about 1.5 years which has order of magnitude of year. Thus year in the life of civilization could be perhaps taken to be the counterpart of 24 hours in human life. Amusingly, one day (24 hours) in the development of a civilization corresponds to 2.7 minutes in life of a human: the period related to the hemisphere dominance is 2 minutes in case of a normal person!

Civilization should have also average lifetime which could relate to the climate cycles of Earth. According to Milankovich's theory, Earth's climate is determined in long time scales by astronomical factors. The changes in the shape of Earth's orbit around Sun have period of about 100.000 years. The precession of Earth's rotation axis about its average direction has a period of about 26.000 years and the gradual rotation of Earth's orbit and the precession Earth's rotation axis give rise to a climatic period of varying between 19.000-23.000 years having average value of 22.000 years. This cycle dominates at the latitudes near to the equator. The angle of tilt of the spinning axis of Earth with respect to the plane of Earth's orbit varies periodically with a period of 41.000 years. This cycle dominates at Northern latitudes. If the maximal cognitive age of individual is taken to be the biological age of earlier times of about 41 years then the age of civilization would be about 22.000 years. If the lifetime is taken 76 years, which is nearer to that of modern man one obtains 41.000 years for the lifetime of civilization. Thus one cannot exclude the possibility that these climate cycles could represent also lifetimes for civilizations. Of course, it might well be that the ability of civilization to manipulate its own genome changes the situation totally.

## 6.6 Semitrance And Organisms As Cell Societies

Bio-systems are populated by binary structures analogous to brain hemispheres and seem to correspond to twin pairs of p-adic length scales differing by a factor of two which are especially abundant in length scales relevant to bio-systems: this in fact led already years ago to the idea that binary structures might be somehow fundamental for the functioning of bio-systems. The common feature of all binary structures in biological length scales is that the number of quantum jumps during estimated wake-up period is extremely large. This follows from the estimate of wake-up period (duration of the mental image defined by self) as the primary p-adic time scale  $T_p = \sqrt{p} \times \tau$ ,  $\tau$  about  $10^4$  Planck times, or more generally n-ary p-adic time scale  $T_{p,n} = p^{n/2} \times \tau$ . The number of quantum jumps occurring during the wake-up period is huge even at elementary particle level (for electron one has  $p = 2^{127} - 1$ ).

Together with p-adic fractality this suggests that all these societies self-organize to universal basic structural and functional patterns differing only scaling. This highly nontrivial hypothesis can be tested by looking whether one can find clear structural and functional analogies between human societies and various cellular and sub-cellular societies. The scenario for the development of language and evolution of the civilization as a transition from bicamerality to modernity provides new insights also about the evolution of genetic code when translated to cellular length scale.

### 6.6.1 Semitrance And Binary Structures

Binary structures can be in three states, in semitrance, in sleep or trance or fully awake and it is interesting to try to figure out the functions associated with the sleep/trance and semitrance states.

#### Biologically relevant binary structures

Semitrance mechanism favors binary structures. It is not absolutely necessary that the components of the binary structure are identical and small symmetry breaking is certainly involved. Lipid layers of the cell membrane, pairs of chromosomes inside nucleus, and the strands of DNA form binary structures being analogous to the left and right hemispheres. In case of DNA the passive strand not participating in transcription of DNA to mRNA could correspond to the right brain hemisphere.

Peptides have non-symmetric binary structure consisting of sugar molecule which is same for all peptides plus radical, which determines the chemical properties of the protein. Sugar molecules form the back-bone of the protein. Sugar molecule and radical could be perhaps regarded as counterparts of the right and left brain hemispheres (not necessary in this order!) at the level of single amino-acid. Micro-tubules consist of tubulin dimers having also binary structure. Tubulin dimers can have several conformations.

#### Semitrance as a control mechanism of binary structures

Emotions affect greatly the functioning of body: in particular, emotions can affect directly neurons and cells. Hormones and various neurotransmitters are certainly involved with the emotional control but it is quite possible that semitrance mechanism is also involved. Semitrance could guarantee the coherent functioning of the cell society by providing organs, cells and even lower level structures with “self narratives” and goal structures. For instance genetic determination could result in this manner. Of course, the time scale would be totally different from human. Semitrance could be realized by the entanglement of the inner lipid layer of the cell membrane and second strands of genes with the higher level selves. Even the notions of cognitive and emotional semitrance might make sense for binary structures, even at DNA level. Cancer might be seen as a disease in which cells have lost contact with “God” and behave hedonically.

An interesting possibility is that semitrance works also as a tool of volition. The most science fictive possibility is that semitrance of the muscle cells makes it possible to realize volition. This would explain the peculiar results of Libet’s experiments demonstrating that the decision to initiate motor action comes later than the motor action itself [J4] (the model for Libet’s observations is discussed [?]). The explanation relies on the two causalities associated with subjective and geometric time. Also the geometric past must change in the quantum jump leading to a motor action.

More precisely, the quantum average space-time associated with the final quantum history must be continuous which implies that new space-time surface begins to change before the geometric time value associated with the quantum jump. A concrete realization is in terms of time mirror mechanism (see **Fig.** <http://tgdtheory.fi/appfigures/timemirror.jpg> or **Fig. ??** in the appendix of this book) and Libet's findings give direct support for the notion of magnetic body. A fascinating possibility is that various muscles or muscle groups have "names" realized as magnetic and/or  $Z^0$  magnetic transition frequencies and that volitional acts involve semitrance mechanism and quantum jumps changing the macroscopic configuration of organism. A less science fictive explanation for the causal anomalies is that same happens at the level of cognitive representation which has initial value sensitive coupling to motor organs.

### Do sleeping binary structures quantum compute?

Binary structures can also spend some time in unconscious state like sleep and trance. During trance state the entire binary structure is strongly bound state entangled and serves as an organ of higher level self. Concerning the interpretation of the sleep state, the first hint comes from the observation that entanglement is weak during sleep state. There is also some evidence for some kind of information processing occurring in brain during sleep state [J14].

Quantum computing have been suggested as a metaphor for the information processing performed by brain. In TGD framework quantum computation corresponds to a period of macro-temporal quantum coherence generated when bound state entanglement is generated between two or more systems is formed. Entangling systems lose their consciousness in the process but the composite system is in a state of consciousness in which mental images stay sharp since quantum jump sequence fuses effectively to single quantum jump and dissipation is absent: kind of "enlightened" state would be in question.

Sleep could thus correspond to a formation of bound state in which brain and body become part of larger system. This would suggest that high level quantum computing like activities indeed occur during sleep. Of course, quantum computing in the strict sense of the word is probably too restricted a notion to be applied in case of biological structures. It might be however that the unconscious information processing by brain known to occur during sleep is analogous to quantum computing.

What is encouraging is that symmetric binary structures seem to be tailor made for quantum computing in a generalized sense. Quantum computer indeed possesses binary structure in the following sense. Quantum computation amounts to calculating a value of function  $i \rightarrow f(i)$ , with  $i$  representing label for a quantum state. The quantum time development leads from state  $|i\rangle \times |i\rangle$  to the state  $|i\rangle \times |f(i)\rangle$  as quantum computation halts by quantum jump possibly leading to the wake-up of the quantum computer.

### 6.6.2 Organism As Cell Civilization

Organism as a cell civilization metaphor provides a new aspect to the vision about bio-systems as macroscopic quantum systems and the structural analogies are surprisingly close and might help to develop concrete models of biological self-hierarchies.

#### Evolution of civilization and cell differentiation

The quantum model for the evolution of the civilization from bicamerality to modernity suggests a generalization. Cell differentiation would obviously corresponds to aging or "modernization" process. Stem cells, abundantly present everywhere in the body except in heart and brain, would be cell children, innocent cellular bicamerals. Various tissue types are counterparts of civilizations and the degree of development should be characterizable by the degree of the differentiation experienced by the cells of the tissue. At cell level, "externalization", the development of non-telepathic communications means the emergence of various chemical communications such as chemotaxis, hormonal communications and finally nerve pulse transmission and eventually leads to the emergence of the central nervous system as the "modern" elite of the cell society. The immune system of the organism has a direct counterpart at level of the societies from ants to humans.

The structure of the central nervous system contains a hierarchical structure of layers. Sensory and motor organs and pathways represent its oldest and most “bicameral” part. Brain stem and paleobrain represent next levels in the hierarchy having fixed wirings. Sensory and motor cortex, multi-modal association regions (present only in human brain) and frontal lobes and language regions consisting of Wernicke and Broca regions and supplementary motor cortex represent in this order structures which are increasingly flexible and “modern”. with various dynamical neural circuits presumably representing language structures. Some regions of brain (for instance, neostriatum) have connections to almost everywhere in cortex: this reminds of the liberation from the restrictions of geography allowed by modern electronic communications.

The modernity of the neuron is measured both by its ability to re-self-organize and by the variability of its gene expression. Learning at neuronal level can be regarded as the first manifestation of the “modernity”. Neural transmitters affect both the synaptic strengths directly and by affecting the gene expression of neuron. The first measure for the “modernity” of neuron is the plasticity of these contacts. The number of social contacts is also a measure for the modernity at the level of human society and corresponds to the number of the synaptic contacts of the neuron with other neurons. The repertoire of self-expression of neuron by nerve pulse patterns looks at first rather restricted: it fires or does not fire. Of course, memetic code means dramatic progress in this respect since temporal patterns of nerve pulses become carriers of conscious information. There could be other modes of self-expression, say by coherent photons which allow mass media type self-expression. The neural transmitters associated with the synaptic contacts are invariants of neuron.

### Structure of central nervous system

One can try guess the structure of the self-hierarchy associated with the central nervous system (CNS) by assuming that the development of CNS is structurally analogous to the development of civilization and applying “Ontogeny recapitulates phylogeny” principle. The latter principle suggests that brain stem and sensory and motor organs as the oldest part of CNS are the most “bicameral” parts of central nervous system: this is certainly as it should be. This part of central nervous system is indeed rigidly wired hardware of CNS determined genetically to very high degree. Linguistic regions of brain in turn represent the most “modern” part of the central nervous system containing dynamical brain circuits.

The architectures of village, town and modern city reflect also the structures of the social self-hierarchies. Same should be true in case of the central nervous system. The structures are present at several levels since central nervous system is like civilization consisting of civilizations consisting of... The roughest vision about self-hierarchy is provided by the architecture of a town. Brain corresponds to “God’s house” in the middle of the town and blood vessel circuitry and sensory and motor pathways are its streets and information pathways. Sensory organs, muscles and various organs are its habitants.

### Brain as town?

Brain consists of three parts: brain stem, paleobrain and cortex and these parts seem to correspond to church in the middle of the town, old town and modern suburban areas. Middle-aged town could serve as a model of paleobrain with various brain nuclei being in the role of houses of the town. Neocortex would represent suburban regions of the brain town. Frontal cortex, associative regions and linguistic regions would be the most modern suburban areas. These brain regions are indeed extremely plastic. For instance, language regions which have been destroyed from left hemisphere at young age can regenerate on right hemisphere.

Reticular formation surrounding thalamus and brain stem is in the geometric center of brain and thus a natural candidate for “God’s house”. Reticular formation is known to control attention and has been one of the main candidates for the seat of consciousness in neuroscience based models of consciousness [J20]. Semitrance might well be involved with the control of attention besides inhibition and excitation which correspond to “externalized” control mechanisms. In TGD framework reticular formation would correspond to highest level of the self hierarchy in brain length scale. Reticular formation could also have the role of an over priest in the sense that the entanglement of brain and some ELF selves (at least that corresponding to 40 Hz thalamocortical

EEG frequency which corresponds to  $n = 3$  multiple of  $Na_+$  cyclotron frequency) involves entanglement sequence *ELF self-reticular formation-region of cortex*. The EEG waves associated with the reticular formation should be non-propagating if this picture is correct.

### 6.6.3 Cell As A Society

Society requires large number of nearly identical basic structural units: inside cell these subunits are proteins and quaternary structures formed by them. Inside the nucleus and other cell organelles these structures are DNA and various structures formed by it (genes, chromosomes).

#### Cell as a city state

Cell resembles the city state of the ancient Greece consisting of several cities governed by kings and surrounded by walls. In case of cell these cities correspond to various cell organelles having their own genome. These cities have many-layered self-hierarchy. Rather amusingly, fairy tales represent metaphorically the structure of cell. Chromosome pairs of tissue cells are like king and queen and chromosomes of germ cells are like princes and princesses. Sexual breeding corresponds to marriages between princes and princesses of the nuclear kingdoms of two city states (Note that ant nest and beehive are amazonian societies with queen ruling alone in her palace.). Walls surrounding the city state and the towns of city state correspond to cell membranes and endoplasmic membranes. More modern metaphor for cell nucleus is as a modern factory (producing building block proteins and using transcription factor proteins to communication purposes).

#### Nucleus as brain of cell/king's palace/factory

Chromosome decomposes into genes decomposing into DNA double strand. Genes are inhabitants of chromosome and are also like king-queen pair of the fairy tales. Only second DNA strand of gene, "king strand" is transcribed. Continuing the right-brain-female metaphor to its limits and perhaps even beyond, one could guess that this strand is responsible for cognitive holism at DNA level whereas the passive strand would be responsible for emotional and sensory holism. Replication of DNA, cloning, does not occur spontaneously at the level of human society: plants however replicate by cloning. Thus DNA and chromosomes could structurally correspond to plants and animal kingdom respectively in the self-organization hierarchy. The two pairs of chromosome would structurally correspond to left and right almost symmetric halves of vertebrates. Of course, these analogies are only meant to suggest that similar self-organization process repeats itself in various length scales in fractal like manner.

Symbol function is basic mechanism at the level of human societies. Coding of genes to proteins is a natural candidate for symbol function at the level of DNA. Proteins could be seen as a written language expressing the basic "This is true" statements are represented by exons. "This is not true" statements correspond to introns and are not represented at protein level although they are transcribed to mRNA. Exon-intron dichotomy has a curious analogy with male-female dichotomy in the past human societies: only man could express himself in the society whereas woman's place was at home. Amusingly, the genes of the immune system are very "modern" in the sense that the change of sex is possible: exons can change to introns and vice versa!

#### Society of proteins

Several hierarchy levels are present also in the cellular society formed by proteins. Proteins do not possess have symmetric binary structure. This does not exclude the possibility of semitrance but could make quantum computing type activities impossible. Proteins resemble termites in the sense that they dynamically self-organize into various quaternary structures, dimers, trimers, etc... Tubulin molecules are an important example of quaternary structures. Tubulin molecules self-organize to dimers, which in turn self-organize to micro-tubules. In this view cytoskeleton formed by tubulin dimers, which most biologists believe to be just what its name suggests, is analogous to living bridges and other architectonic structures formed by termites. From the point of view of cell nucleus lipids are like stones in the wall of city rather than citizens themselves. Indeed, protein structures realize genetic code whereas lipid layers are structures making possible to realize memetic code and correspond to higher level of cognition.

### 6.6.4 DNA And The Analogy With The Development Of Language

One can try to apply the ideas about organism as cell society and about the evolution of language as establishment of the memetic code in the attempts to understand how genetic code has established itself. Along these lines chromosomes could be seen as mini brain and transcription factor proteins as the counterpart of the written language. Proteins can be regarded as written messages sent by genes to each other and activating or de-activating the transcription of gene. Proteins could be also seen as conscious messengers able to transfer more complex messages than classical field at resonant frequency (counterparts of inhibition and excitation become possible).

#### Identifying the counterpart of the spoken language at gene level

Language metaphor leads to a highly nontrivial predictions. The use of proteins as a communication tool should have been preceded by some other non-chemical communication tool analogous to the spoken language. Of course, these tools would be still in use. These communications could have been realized electromagnetically or in terms of classical  $Z^0$  fields utilizing p-adic cognitive codes. Intronic memes should utilize this communication tool in the control of genes.

The communications could have been very simple: just gene specific command waking-up gene and activating it to transcribe mRNA to be translated to protein and/or generating a command waking-up some other gene. Each gene would have had its own eigen frequency (or set of eigen frequencies) which can be said to serve as its “name” or a command activating only that particular gene and the generation of em or classical  $Z^0$  field with this frequency wakes-up “gene self” and activates transcription. The activated gene either produces building block protein and/or activates some other gene by producing (say) ELF em field with the characteristic frequency associated with that gene. The association of the “spelled” frequency with the “heard” frequency is completely analogous to the formation of association at neural level.

It is quite possible that already at this stage gene decomposed to a control region “hearing the command” and analogous to the auditory regions of brain and the “gene proper” analogous to the speech region of brain. Later the control regions developed to binding sites for proteins serving as transcription factors. At this stage also inhibition/excitation became possible and correspond to repressors/promoters and silencers/enhancers.

Rather than trying to identify the precise counterpart of sound as communication tool, one can try to identify the counterparts for the quantum mechanisms behind the auditory experience and cognition at DNA level. The quantum models for auditory experience and cognition at the level of cell membrane are extremely general and rely on the notion of cognitive antineutrinos. The model for cognition at cell membrane level generalizes also to the level of DNA and micro-tubular level [K37] and there is no reason hindering the formal generalization of also the model of auditory experience to DNA and also micro-tubular level.

In the course of self-organization each gene adopted its characteristic axial  $Z^0$  magnetic field defining unique spin flip frequency effectively serving as the name of the gene initiating transcription process. The command came either from a higher level self entangling with the passive DNA strand or was uttered by other gene generating ELF em field or some other perturbation with spin flip transition frequency.

This view suggests that Jaynes’s vision about commands, modifiers and nouns preceding names is not correct: perhaps names emerged before nouns. That child learns names and nouns simultaneously and that even animals learn their name supports this view. Of course, it is to some degree a matter of taste whether one regards magnetic transition frequency waking-up only single gene as name or a command heard by only this particular gene. Note that names might have emerged from the specialization of the members of group to various tasks: the command obeyed by a particular individual became gradually the name of the individual. The names of Indians of North-America are indeed of form “Does something”.

#### Proteins and written language

The un-reliability of the speech like communications could be seen as one reason which might have led to the emergence of proteins as “written language” which is slower but more reliable and much more precise. If the proposed analogy relying on the universality of self-organization patterns works, “written” language at DNA level developed from the “spoken” language, when proteins began to

signify the name of preferred genes in the sense that they began to bind to the control units of these genes and act as transcription factors. Protein language should have developed gradually (possibly through intermediate forms) like written language did. The rules were established by quantum self-organization and made possible by the weak initial value sensitivity of the asymptotic patterns of quantum self-organization. It would be interesting to try to identify the analogs of syntactic structures of the language from the structure of the genome and proteins. The development of society and language occurred in a parallel manner and structures of the society were paralleled by the structures of the language. This suggests that the syntactic structures of “gene language” should correspond directly to various structures of the organism. Clusters form by Hox genes provide an example of higher level structural units of this kind [K45].

**CRAZY STUFF**

## Chapter 7

# Crop Circles and Life at Parallel Space-Time Sheets: Part I

### 7.1 Introduction

Crop circles as a hoax is a good candidate for one of the great illusions of century created by the market economy media serving as a voice of pseudo skeptics. Crop circles as a hoax is one of the illusions of century created by the market economy media. Strangely, this claim which was made without a single thread of evidence, was generally accepted, and has remained a general belief. This despite the fact that already for more than half decade it has been known that all crop circles cannot be hoaxes. The articles in the BLT homepage [H1] provide detailed scientific information about crop formations and the reading of these articles changed also my own attitudes thoroughly.

#### 7.1.1 Strange Phenomena Associated With Crop Formations

For instance, micro-wave induced explosions in growth nodes of crops are regularly involved [H19]. Also meteoric material is often associated with the crop formations [H17] but not to the region exterior to them: this is absolutely impossible if the formations were made by human artists. Routine laboratory tests allow to judge whether the formation is man-made.

Models involving plasma flows from the ionosphere to the crop field formation have been developed [H16]. The regions where the soil has a high content of calcium carbonate (chalk) helping to charge it electrically are the places where the circles appear predictably from year to year. There is also evidence suggesting that this interaction exists during the entire growth period so that there would be a continual connection to ionosphere [H4]. Living matter involves plasma phases and the experimental work of Pollack [19] leads to the notion of gel like fourth phase of water containing negatively charged exclusion interpreted in TGD framework as having lost part of their protons to magnetic flux tubes where it is as dark matter identified as having large value of effective Planck constant  $h_{eff} = n \times h$ .

Simplest crop circles indeed have a form similar to plasma self-organization patterns but there are also differences suggesting that the formations are not natural. Small plasma balls have been observed in the fields both before and after the appearance of the crop formation [H4]. There are also irregular, “non-geometric”, patterns of downing which must have been created by same mechanism as crop circles involving the interaction with the ionosphere [H4]. These are ideal bits of data for developing in detail hypothesis that any living system, even plants and plant populations, has a magnetic body, and that also magnetosphere is a conscious and intelligent entity receiving information from and controlling the biosphere. The resulting model supports the view about crop circles as an attempt of (geo-, planeto-, helio-, or some other) magnetospheric selves to tell about their existence to us.

### 7.1.2 Model For The Generation Of Crop Circles

A model for the generation of crop circle formation is developed. Next chapter [K28] is devoted to the attempt to understand Chilbolton and Crabwood crop circles as messages providing biological information (including genetic codes) about some unknown life forms. Especially the question where where life forms might live is discussed.

The model for crop circle formation relies on the model for magnetic bodies, in particular magnetosphere, as an intentional agent able to control biological bodies. As in the earlier model magnetosphere uses plasmoids to construct the crop circles. The general model for bio-control relying on dark matter hierarchy is the fundamentally new element now common to all applications of quantum TGD to biology, which raises the hope that the model could be nearer to truth even at the level of details. The updated model indeed differs considerably from the earlier model as far as the detailed mechanism generating crop circles is considered.

A second central element of the model is the model for the dark plasmoid as a rotating magnetic system, very much analogous to Searl machine [A17]. the model of which is developed in [K92]. The model of plasmoid explains various mysterious looking findings such as microwave induced expansion of growth nodes, the presence of magnetized iron having meteoric origin, and the amorphous glass spheres found near crop circles. Additional support for the picture comes from the finding that plasmoids generated in laboratory seem to have the basic characteristics assigned to living matter [I30]. Here a connection with Pollack's work is highly suggestive.

The appendix of the book gives a summary about basic concepts of TGD with illustrations. There are concept maps about topics related to the contents of the chapter prepared using CMAP realized as html files. Links to all CMAP files can be found at <http://tgdtheory.fi/cmaphtml.html> [L1]. Pdf representation of same files serving as a kind of glossary can be found at <http://tgdtheory.fi/tgdglossary.pdf> [L2].

## 7.2 Some Aspects Of TGD Based Vision About Living Systems

In this section the relevant aspect of TGD based vision about living systems are discussed with a particular emphasis on the implications of the dark matter hierarchy. The section summarizes material from many sources. The chapters [K14, K15] of [K60] discuss the high  $T_c$  superconductivity which is key element of the picture. The chapters [K31, K29, K30] of this book discuss the implications of dark matter hierarchy for biology. The chapters [K12, K38, K41] in turn discuss remote metabolism, the vision about living matter as a conscious hologram, and the detailed role of water for life and the implications of dark matter hierarchy are also now very strong.

### 7.2.1 Magnetic Bodies And Magnetosphere As A Living System

TGD based view about classical fields differs radically from the Maxwellian one. Topological field quantization means that classical fields and matter form a Feynman diagram like structure consisting of lines representing matter (say charged particles) and bosons (say photons). The matter lines are replaced by space-time sheets representing matter (elementary particles, atoms, molecules, ...), and virtual bosons are replaced by topological light rays ("massless extremals", MEs). Also magnetic flux tubes appear and together with MEs they serve as correlates for bound state quantum entanglement.

The classical fields associated with MEs interfere only at the nodes, where they meet, and one has a hologram like structure with nodes interpreted as the points of a hologram. Thus one avoids the loss of information caused by the interference of all signals everywhere. This aspect is crucial for understanding the role of em fields in living matter and brain. The MEs corresponding to "real photons" are like laser beams entering the hologram and possibly reflected from it. What is new that the nodes can be connected by "virtual photon" MEs also analogous to laser beams. Hence also "self-holograms" with no laser beam from external world are possible (brain without sensory input).

The hologram has a fractal structure: there are space-time sheets at space-time sheets and high frequency MEs propagating effectively as mass-less particles inside low frequency MEs serving

as quantum entangling bridges of even astrophysical length. The particle like high frequency MEs induce “bridges” between magnetic flux tubes and atomic space-time sheets at the receiving end. This makes possible the leakage of supra currents from magnetic flux tubes to atomic space-time sheets analogous to the exposure of film producing hologram. The leakage induces dissipation, self-organization, and primitive metabolism as a cyclic flow of ionic currents between the two space-time sheets, and thus a Darwinian selection of the self-organization patterns results. The low frequency MEs are responsible for bound state entanglement, macroscopic quantum coherence and co-operation whereas high frequency MEs are responsible for self-organization and competition.

TGD framework differs from Maxwellian also in that it is possible to assign to a given physical system a magnetic body having usually a size much larger than that of the system itself. The magnetic body provides kind of a monitor screen at which higher level information about the system is represented and defines thus sensory representations about the system. Magnetic body as a manual for a system is also a useful metaphor. Besides our own magnetic bodies (of astrophysical size), the magnetosphere of Earth is especially interesting magnetic body, and can be regarded as a living system receiving sensory input from biosphere, in particular our brains [K44].

Also the magnetosphere in the Earth’s interior is highly interesting. Especially interesting are various boundary layers since energy currents occur here and make complex self-organization patterns possible. Magnetosphere contains many layers of this kind and in the Earth’s interior mantle-core and core-inner core layers are of special interest as possible seats for intelligent life and the life-forms responsible for the crop formations might be ITs (intra-terrestrials).

The magnetospheric sensory representations associated with the life-forms in questions (say ITs) could induce the interaction between ionosphere and bio-matter and make also the plasma leakage possible. These magnetic bodies would be there all the time and this conforms with the finding that alterations to crop stem below head must have occurred long before the crop formation emerged.

### 7.2.2 Mersenne Hypothesis

The hierarchy of dark matter levels is labeled by the values of Planck constant having quantized but arbitrarily large values TGD inspired quantum biology and number theoretical considerations suggest preferred values for  $r = \hbar/\hbar_0$ . For the most general option the values of  $\hbar$  are products and ratios of two integers  $n_a$  and  $n_b$ . Ruler and compass integers  $n$  expressible as  $n = 2^k \prod_n F_{s_n}$ , where  $F_s = 2^{2^s} + 1$  is Fermat prime and each of them can appear only once, are number theoretically favored values for  $n_i$  because the phases  $\exp(i2\pi/n_i)$ ,  $i \in \{a, b\}$ , in this case are number theoretically very simple and should have emerged first in the number theoretical evolution via algebraic extensions of p-adics and of rationals. The known Fermat primes are  $F_0 = 3, F_1 = 5, F_2 = 17, F_3 = 257, F_4 = 2^{16} + 1$ . p-Adic length scale hypothesis favors powers of two as values of  $r$ .

The hypothesis that Mersenne primes  $M_k = 2^k - 1$ ,  $k \in \{89, 107, 127\}$ , and Gaussian Mersennes  $M_{G,k} = (1 + i)k - 1$ ,  $k \in \{113, 151, 157, 163, 167, 239, 241, \dots\}$  (the number theoretical miracle is that all the four called up electron Compton lengths  $L_e(k) = \sqrt{5}L(k)$  with  $k \in \{151, 157, 163, 167\}$  are in the biologically highly interesting range 10 nm-2.5  $\mu\text{m}$ ) define scaled up copies of electro-weak and QCD type physics with ordinary value of  $\hbar$  and that these physics are induced by dark variants of corresponding lower level physics leads to a prediction for the preferred values of  $r = 2^{k_d}$ ,  $k_d = k_i - k_j$ , and the resulting picture finds support from the ensuing models for biological evolution and for EEG [K30]. This hypothesis - to be referred to as Mersenne hypothesis - replaces the earlier rather ad hoc proposal  $r = \hbar/\hbar_0 = 2^{11k}$  for the preferred values of Planck constant. The background necessary for understanding what is involved is described in [K14, K15, K30].

### 7.2.3 Fractal Hierarchy Of Magnetic Flux Sheets And The Hierarchy Of Genomes

The notion of magnetic body is central in the TGD inspired theory of living matter. Every system possesses magnetic body and there are strong reasons to believe that the magnetic body associated with human body is of order Earth size and that there could be an entire hierarchy of these bodies

with even much larger sizes. Therefore the question arises what one can assume about these magnetic bodies. The quantization of magnetic flux suggests an answer to this question.

1. The quantization condition for magnetic flux reads in the most general form as  $\oint (p - eA) \cdot dl = n\hbar$ . If supra currents flowing at the boundaries of the flux tube are absent one obtains  $e \int B \cdot dS = n\hbar$ , which requires that the scaling of the Planck constant scales up the flux tube thickness by  $r^2$  and scaling of  $B$  by  $1/r$ . If one assumes that the radii of flux tubes do not depend on the value of  $r$ , magnetic flux is compensated by the contribution of the supra current flowing around the flux tube:  $\oint (p - eA) \cdot dl = 0$ . The supra currents would be present inside living organism but in the faraway region where flux quanta from organism fuse together, the quantization conditions  $e \int B \cdot dS = n\hbar$  would be satisfied.
2. From the point of view of EEG especially interesting are the flux sheets which have thickness  $L(151) = 10$  nm (the thickness of cell membrane) carrying magnetic field having strength of endogenous magnetic field. In absence of supra currents these flux sheets have very large total transversal length proportional to  $r^2$ . The condition that the values of cyclotron energies are above thermal energy implies that the value of  $r$  is of order  $2^{k_d}$ ,  $k_d = 44$ . Strongly folded flux sheets of this thickness might be associated with living matter and connect their DNAs to single coherent structure. One can of course assume the presence of supra currents but outside the organism the flux sheet should fuse to form very long flux sheets.
3. Suppose that the magnetic flux flows in head to tail direction so that the magnetic flux arrives to the human body through a layer of cortical neurons. Assume that the flux sheets traverse through the uppermost layer of neurons and also lower layers and that DNA of each neuronal nuclei define a transversal sections organized along flux sheet like text lines of a book page. The total length of DNA in single human cell is about one meter. It seems that single organism cannot provide the needed total length of DNA if DNA dominates the contribution. This if of course not at all necessarily since supra currents are possible and outside the organism the flux sheets can fuse together. This implies however correlations between genomes of different cells and even different organisms.

These observations inspire the notion of super- and hyper genes. As a matter fact, entire hierarchy of genomes is predicted. Super genes consist of genes in different cell nuclei arranged to threads along magnetic flux sheets like text lines on the page of book whereas hyper genes traverse through genomes of different organisms. Super and hyper genes provide an enormous representative capacity and together with the dark matter hierarchy allows to resolve the paradox created by the observation that human genome does not differ appreciably in size from that of wheat.

### 7.2.4 Does A Dark Copy Of Earth's Magnetic Field Exist?

For years I erratically believed that the magnitude of the magnetic field assignable to the biological body is  $B_E = .5$  Gauss, the nominal value of the Earth's magnetic field. Probably I had made the calculational error at very early stage when taking  $Ca^{++}$  cyclotron frequency as a standard. I am grateful for Bulgarian physicist Rossen Kolarov for pointing to me that the precise magnitude of the magnetic field implying the observed 15 Hz cyclotron frequency for  $Ca^{++}$  is .2 Gauss and thus slightly smaller than the minimum value.3 Gauss of  $B_E$ . This value must be assigned to the magnetic body carrying dark matter rather than to the flux quanta of the Earth's magnetic field. This field value corresponds roughly to the magnitude of  $B_E$  at distance  $1.4R$ ,  $R$  the radius of Earth.

Dark matter hierarchy leads to a detailed quantitative view about quantum biology with several testable predictions [K30]. The applications to living matter suggests that the basic hierarchy includes the hierarchy of Planck constant

In the case of magnetic flux simplest quantization suggests the scaling  $B \rightarrow B/r$  for the magnetic fields. This is assumed to hold true also in more general case when the quantization condition reads as  $\oint (p - ZeA)dl = n\hbar$  and involves currents flowing at the boundaries of flux quanta so that magnetic flux need not be anymore quantized to a multiple of Planck constant. For axonal membranes the flux quantization with  $n = 0$  is natural since the size of flux quantum does

not depend on the value of Planck constant. Assuming flux quantization and standard value of Planck constant  $B_{end} = .2$  Gauss would give flux tube radius  $L = \sqrt{5/2} \times L_e(169) \simeq 1.58L_e(169)$ , which does not correspond to any p-adic length scale as such.

Concerning the interpretation of  $B_{end}$  there are two options. It could correspond to a personal magnetic body or to a dark variant of the Earth's magnetic field. At this moment it is impossible to say which if any hypothesis is right. However the fact that the ELF fields have no direct effect on conscious experience mildly supports the identification as the dark variant of  $B_E$ .

### 7.2.5 Basic Vision About Living Matter

#### General mechanisms of bio-superconductivity

The many-sheeted space-time concept provides a very general mechanism of superconductivity based on the “dropping” of charged particles from atomic space-time sheets to larger space-time sheets. The first guess was that larger space-time sheets are very dry, cool and silent so that the necessary conditions for the formation of high  $T_c$  macroscopic quantum phases are met.

The possibility of large  $\hbar$  quantum coherent phases makes however the assumption about thermal isolation between space-time sheets un-necessary. At larger space-time sheet the interactions of the charged particles with classical em fields generated by various wormhole contacts feeding gauge fluxes to and from the space-time sheet in question give rise to the necessary gap energy. The simplest model for Cooper pair is space-time sheet containing charged particles having attractive Coulomb interaction with the quarks and antiquarks associated with the throats of the wormhole contacts.

A crucial element is quantum criticality predicting that new kind of superconductivity, “boundary superconductivity”, appears at the fluctuating boundaries of competing ordinary and large  $\hbar$  phases for nuclei besides large  $\hbar$  variant of ordinary superconductivity in the interior. The Cooper pairs of interior and boundary supra currents are different with interior Cooper pairs being BCS type. These two superconducting phases compete in certain narrow interval around critical temperature for which body temperature of endotherms is a good candidate in the case of living matter. Also high  $T_c$  superfluidity of bosonic atoms dropped to space-time sheets of electronic Cooper pairs becomes possible besides ionic super conductivity. Even dark neutrino superconductivity can be considered below the weak length scale of scaled down weak bosons.

Magnetic and  $Z^0$  magnetic flux tubes and sheets are especially interesting candidates for supra current carries. In this case the Cooper pairs must have spin one and this is indeed possible for wormholly Cooper pairs. The fact that the critical magnetic ( $Z^0$  magnetic) fields can be very weak or large values of  $\hbar$  is in accordance with the idea that various almost topological quantum numbers characterizing induced magnetic fields provide a storage mechanism of bio-information.

This mechanism is extremely general and works for electrons, protons, ions, charged molecules and even exotic neutrinos and an entire zoo of high  $T_c$  bio-superconductors, super-fluids and Bose-Einstein condensates is predicted. Of course, there are restrictions due to the thermal stability at room temperature and it seems that only electron, neutrino, and proton Cooper pairs are possible at room temperature besides Bose-Einstein condensates of all bosonic ions and their exotic counterparts resulting when some nuclear color bonds become charged [K83].

#### Bose-Einstein condensates at magnetic flux quanta in astrophysical length scales

The basis elements of the model is dark magnetic field  $B_{end} = 2B_E/5 = .2$  Gauss explaining the effects of ELF em fields in brains of vertebrates in terms of cyclotron transitions of biologically important ions.  $B_{end}$  could be a dark companion of the ordinary magnetic field of Earth or represent personal magnetic body.

The new model for the topological condensation at magnetic flux quanta is based on the dark matter hierarchy with levels characterized by the values of  $\hbar$  consistent with Mersenne hypothesis or more general ruler and compass integer hypothesis.

1. There are several levels of dynamics. In topological condensation the internal dynamics of ions is unaffected and  $\hbar$  has the ordinary value. The formation of Cooper pairs involves dynamics at relatively low level of dark matter hierarchy. Also the dynamics of ionic Cooper

pairs remains unaffected in the topological condensation to magnetic flux quanta obeying  $k_d > 1$  dynamics.

2. Cyclotron energies scale as  $r = 2^{k_d}$  so that for a sufficiently high value of  $k$  thermal stability of cyclotron states at room temperature is achieved. Spin interaction energy  $\mu \cdot B \propto S \cdot B$  scales as  $1/r$  since four-momentum and angular momentum are by Poincare symmetry invariant under the scaling of  $\hbar$  (the highly non-trivial implications of the invariance of angular momentum are discussed in [K97]). Hence spin interaction energy has the ordinary value. Unless thermal isolation is assumed, spin degrees of freedom are thermalized, and only cyclotron degrees of freedom can be quantum coherent. This is a testable prediction distinguishing between the new and old model.
3. If the flux quanta of  $B_{end}$  correspond to  $k_d = 44$  level of dark matter hierarchy, cyclotron energies  $E = (\hbar/2\pi) \times ZeB/Am_p$  are scaled up by a factor  $r = 2^{44}$  from their ordinary values and are above thermal energy at room temperature for  $A \leq 233Z$ , where  $Z$  is the charge of the ion. Even for  $Z = 1$  this includes all stable nuclei. Bose-Einstein condensates of bosonic ions are thus possible at room temperatures at Earth's surface. Cooper pairs of fermionic ions are possible only for  $A \leq 4$  leaving in practice only protons into consideration. Also bosonic molecular ions can suffer BE condensation.

## 7.2.6 Dark Matter Hierarchy And Big Leaps In Evolution

Dark matter hierarchy leads to an amazingly concrete picture about evolutionary hierarchy allowing to identify the counterparts for concepts like mineral, plant, and animal kingdom that we learned during schooldays and ceased to take seriously as students of theoretical physics as we learned that other sciences are just taxonomy. Even more, a view about what distinguishes between prokaryotes, eukaryotes, animal cells, neurons, EEG, and even about what makes cultural evolution, becomes possible. This view is also very useful when one tries to understand the role of microtubules.

The appearance of CDs scaled up in size by  $r = \hbar/\hbar_0$  and space-time sheets scaled up in size by  $\sqrt{r}$  means the emergence of new levels of structure and it is natural to identify big leaps in evolution in terms of emergence of new larger matter carrying space-time sheet magnetic flux sheets and corresponding magnetic bodies. If magnetic flux quanta are scaled by  $r$  magnetic flux quantization conditions remain unaffected if magnetic field strengths scale down by  $1/r$  so that the energies of cyclotron photons are not affected. The thickness of flux tubes can remain unchanged if the currents running at the boundaries of the flux quantum cancel the magnetic flux. As already found, this mechanism must be at work inside living organisms whereas in far away region flux quanta are scaled up in size.

The attractive hypothesis is that the leaps in evolution correspond to the emergence of dark variants of weak and possibly also color interactions in dark p-adic length scales which correspond to ordinary p-adic length scales characterized by Mersenne primes. These leaps would be quantum leaps but in different sense as thought usually. The emergence of higher dark matter levels would basically mean the integration of existing structures to larger structures. A good metaphor are text lines at the pages of book formed by magnetic flux sheets whose width is scaled up by  $r$  as the new level of dark matter hierarchy emerges. The big leaps can occur both at the level of organism and population and organisms with rather low individual dark matter level can form societies with high dark matter levels and high collective intelligence (honeybees and ants are good example in this respect).

Certainly also other scalings of Planck constant than those summarized in tables are possible but these scalings are of primary interest. This intuition is supported by the observation that electron is completely exceptional in this framework. Scaled up electron Compton lengths  $L_e(k) = \sqrt{5}L(k)$ ,  $k = 167, 169$ , assignable to atomic and molecular physics and to the Gaussian Mersennes  $M_{G,k} = (1+i)^k - 1$ ,  $k \in \{151, 157, 163, 167\}$  are in the length scale range between cell membrane thickness 10 nm and nucleus size 2.58  $\mu\text{m}$ . The corresponding length scales  $L_e(k)$ , the number of which is 23, are excellent candidates for the scales of basic building bricks of living matter and vary from electron's p-adic length scale up to 2.58 m ( $k = 167$  defining the largest Gaussian Mersenne in cell length scale range). The corresponding Compton time scales vary from 1 seconds for electron defining the fundamental biorhythm to  $9.6 \times 10^{14}$  years which is by 4-5 orders longer than the age

of the observed Universe. For  $k = 167$  the time scale is  $1.1 \times 10^{11}$  years and is by one order of magnitude longer than the age of the observed Universe estimated to be  $1.37 \times 10^{10}$  years [E1].

This conceptual framework gives rather strong guidelines for the identification of the levels of evolutionary hierarchy in terms of dark matter hierarchy. The outcome is a more detailed vision about big evolutionary leaps. Note that in the sequel only the general option is considered: the justification for this is that for this option electron appears as a dark particle for all length scales defined by Gaussian Mersennes as well as in atomic length scales. The basic vision in nutshell is that evolution means the emergence of dark weak and gluonic physics in both dark and ordinary length scales and that the size scales of the basic biostructures correspond to Mersenne primes and their Gaussian variants.

### A sketch about basic steps in evolution

The vision about evolution depends on what one assumes about the initial state.

1. If one assumes that weak bosons with ordinary value of Planck constant were present in the beginning, evolution would mean a steady growth of  $k_d$ . The problem is that small values of  $k_d = k_1 - k_2$  correspond to the Gaussian Mersennes defining cellular length scales. If these exotic weak physics were present from the beginning, large parity breaking in cellular length scales would have been present all the time.
2. An alternative and perhaps more realistic view is that the evolution means the emergence of exotic weak physics corresponding almost vacuum extremals in increasingly longer length scales. A possible mechanism could have been the induction of exotic  $\hbar_0$  variant of weak physics at the nearest Mersenne length scale  $k_{next}$  by the dark variant of weak physics at level  $k$  so that one would have  $k_d = k_{next} - k$ . The simplest induction sequence would have been  $89 \rightarrow 107 \rightarrow 113 \rightarrow 127 \rightarrow 151 \rightarrow 157 \rightarrow 163 \rightarrow 167$  corresponding to  $k_d \in \{18, 6, 14, 24, 6, 6, 4\}$ . A possible interpretation of exotic  $\hbar_0$  physics is in terms of almost vacuum extremals and non-standard value of Weinberg angle: also weak bosons of this physics would be light. This sequence defines the minimal values for  $k_d$  but also larger values of  $k_d$  are possible and would correspond to steps between neighbours which are not nearest ones.

The following sketch about the basic steps of evolution relies on the latter option.

#### 1. Elementary particle level

Magnetic bodies with size scale defined by the sizes of CDs assignable to quarks and leptons and possibly also weak bosons (already now the size of big neuron emerges) corresponds to the lowest level of hierarchy with the sizes of the basic material structures corresponding to the Compton lengths of elementary particles. The fundamental bio-rhythms corresponding to frequencies 10, 160, and 1280 Hz appear already at this level in zero energy ontology which suggests that elementary particles play a central and hitherto unknown role in the functioning of living matter.

#### 2. $89 \rightarrow 107$ step with $k_d = 18$

The first step would have been the emergence of  $k_{eff} = 107$  weak bosons inducing  $\hbar_0$  weak physics in  $k = 107$  length scale characterizing also ordinary hadrons. This in turn would have led to the emergence of exotic nucleons possibly corresponding to almost vacuum extremals. The reduction of the model for the vertebrate genetic code to dark hadron physics [K94] is one of the most unexpected predictions of quantum TGD and assumes the existence of exotic- possibly dark- nucleons whose states with a given charge correspond to DNA, RNA, mRNA, and tRNA. The  $\hbar_0$  variants of these nucleons would interact via weak bosons with hadronic mass scale. The exotic variants of the ordinary  $k = 113$  nuclei would correspond to the nuclear strings consisting of exotic nucleons [K21, K94] and define nuclear counterparts for DNA sequences. Their dark counterparts could define counterparts of DNA sequences in atomic physics length scales. Therefore a justification for the previous observation that genetic code could be realized at the level of hadron physics and that chemical realization would be higher level realization finds justification. The anomalous properties of water could be also partly due to the presence of dark nucleons and the proposal was that the presence of exotic nuclei is involved with water memory [K38]. The possible existence of the analog of DNA-RNA transcription between ordinary DNA and its nuclear

counterpart would have dramatic implications. For instance, one can imagine a mechanism of homeopathy based on this kind of transcription process which would also allow a modification of genome by using dark nuclei to communicate the DNA sequences through the cell membrane to the target nuclei.

3.  $107 \rightarrow 113$  step with  $k_d = 6$

The next step would have been the emergence of  $k_{eff} = 113$  weak bosons inducing  $\hbar_0$  weak physics in  $k = 113$  length scale characterizing also ordinary hadrons. Exotic variants of the ordinary nuclei possibly corresponding to almost vacuum extremals could have emerged interacting weakly (or actually relatively strongly!) via the exchange of weak bosons with mass scale of order 100 MeV. Also dark variants of the exotic  $k = 107$  nucleons could have emerged and formed exotic nuclei of size scale  $k = 119$ .

4.  $113 \rightarrow 127$  step with  $k_d = 14$

At this step weak bosons in electron mass scale would have emerged. Whether these weak bosons could have induced large parity breakings in atomic and molecular length scales is not clear. Viruses, which do not yet possess cell membrane could correspond to this level of hierarchy.

5.  $127 \rightarrow 151$  step with  $k_d = 24$

This step would have been fundamental since weak bosons in cell membrane length scale would have appeared. Note that by  $113 - 89 = 24$  this step also leads from  $k = 89$  weak bosons to  $k = 113$  weak bosons. The weak bosons assignal to  $k = 151$  could correspond to the weak interactions associated with almost vacuum extremals and  $\sin^2(\theta_W) = .0295$  could correspond to the weak physics in question.

$k_d = 24$  step for  $k = 113$   $\hbar_0$  weak bosons would have produced them in  $k_{eff} = 137$  atomic length scale with  $L_e(137) \simeq .78$  Angstrom This could have naturally led to large parity breaking effects and chiral selection.

Dark  $k_{eff} = 151$  electrons appearing in the TGD inspired model of high  $T_c$  super-conductivity would have been a by-product of this step. Whether dark electrons could have transformed to light  $\hbar_0$  electrons (of mass.25 keV) with a common mass scale of order  $10^2$  eV with exotic weak bosons is an interesting question. The model of high  $T_c$  super-conductivity predicts the presence of structures analogous to cell membrane. This would suggest that cell membranes emerged and chiral selection emerged at this step so that one could not distinguish the emergence of molecular life as a predecessor for the emergence of cell membrane like structures. This would conform with the fact that DNA molecules are stable only inside cell nucleus. Note that for  $k_{eff} = 151$  electron's CD has time scale  $2^{24} \times .1$  seconds -that is 19.419 days (day=24 hours).

The smallest nanobes [I4] appearing in rocks have size 20 nm and could have emerged at this step. The size of the viruses [I6] is between 10-300 nm covers the entire reange of length scales assignable to Gaussian Mersennes, which suggests that smallest viruses could have emerged at this step. Also the smallest [I3] [I3], which by definition have size smaller than 300 nm could have appeared at this stage.

6. *The remaining steps*

The remaining steps  $k = 151 \rightarrow 157 \rightarrow 163 \rightarrow 167$  could relate to the emergence of coiling structure DNA and other structures inside cell nucleus.  $k = 167$  would correspond to  $k_d = 167 - 89 = 68$  to be compared with the value  $k_d = 47$  required by 5 Hz Josephson frequency for the neuronal membrane for -70 mV resting potential. Note that  $k_d = 48$  (state 1-2 of deep sleep) corresponds to  $k = 163$ .

By their smallness also double and triple steps defined by  $k_d = k_{i+n} - k_i$ ,  $n > 1$ , are expected to be probable. As a consequence, electrons can appear as dark electrons at all the Gaussian Mersenne levels. At these steps the dark electrons corresponding to primes  $k_{eff} = 137, 139$  would appear. For  $k = 137$  dark electron appears with CD time scale equal to 128 seconds- rather precisely two minutes. The model for EEG suggests that the exotic weak bosons appear in the scales  $k_{eff} = 136, 137, 138$ .

Further multisteps from the lower levels of hierarchy would give structures with size scales above the size of cell nucleus possibly assignable to organs and structural units of brain. The dark levels assignable to electron are expected to be of special interest. It is encouraging that

the longest scale assignable to electron in this manner corresponds to  $k = 205$  and length scale of 1.28 m defining body size. As a consequence dark electrons are predicted at levels  $k = 137, 139, 141, 143, 145, 147$  coming as octaves.

Prokaryotic cells (bacteria, archea) without cell nucleus for which cell membrane is responsible for metabolic functions and genome is scattered around the cell could have emerged at this step. This would mean that the emergence of the cell membrane thickness as a fundamental scale is not enough: also the size scale of membrane must appear as p-adic length scale. The sizes of most prokaryotes vary between  $1 \mu\text{m}$  and  $10 \mu\text{m}$ : the lower bound would require  $k = 163$ . There also prokaryotes with sizes between  $2 \mu\text{m}$  ( $k = 157$  corresponds to  $0.8 \mu\text{m}$ ) and  $750 \mu\text{m}$ . Cell nuclei, mitochondria, and other membrane bounded cell nuclei would have evolved from prokaryotes in this framework. The sizes of eukaryote cells are above  $10 \mu\text{m}$  and the fact that multicellular organisms are in question strongly suggests that the higher multisteps giving rise to weak bosons and dark electrons in length scales above  $L_e(167)$  are responsible for multi-cellular structures.

This scenario leaves a lot of questions unanswered. In particular, one should understand in more detail the weak physics at various length scales as well as various exotic nuclear physics defined by dark nucleons and dark variants of nuclei.

### Division of the evolution to that of biological body and magnetic body

Electron's Mersenne prime  $M_{127}$  is the highest Mersenne prime, which does not correspond to a completely super-astrophysical p-adic length scale. In the case of Gaussian Mersennes  $M_{G,k}$  one has besides those defined by  $k$  in  $\{113, 151, 157, 163, 167, \dots\}$  also the ones defined by  $k$  in  $\{239, 241, 283, 353, 367, 379, 457, 997\}$  [A1]. The appropriately extended model for evolution allows to distinguish between three kinds of values of  $k_{eff}$ .

1. The values of  $k_{eff}$  for which electron can appear as dark particle and thus satisfying  $k_{eff} \leq 205$  (Table 5). These levels would correspond to structures with size below 1.25 m defined roughly by human body size and it is natural to assign the evolution of super-nuclear structures to the levels  $167 < k_{eff} \leq 205$ .
2. The values of  $k_{eff}$  for which dark gauge bosons are possible in the model. This gives the condition  $k_{eff} \leq 235$ . These levels correspond to structures in the range 1.25 m-40 km. The identification as parts of the magnetic body can be considered.
3. The values of  $k_{eff}$  obtained by adding to the system also the Gaussian Mersenne pair  $k \in \{239, 241\}$  allowing also the dark electrons. The lower size scale for these structures is 640 km.
4. The higher levels corresponding to  $k_{eff}$  in  $\{283, 353, 367, \dots\}$ . The lower size scale for these structures is 3 AU (AU is the distance from Earth to Sun).

$k_{eff} > 205$  levels would correspond to the emergence of structures having typically size larger than that of the biological body and not directly visible as biological evolution. This evolution could be hidden neuronal evolution meaning the emergence of extremely low Josephson frequencies of the neurons modulating higher frequency patterns and being also responsible for the communication of long term memories.

### Biological evolution

In principle the proposed model allowing multisteps between hierarchy levels defined by Mersenne primes and their Gaussian counterparts could explain the size scales of the basic structures below the size scale 1.25 m identified in terms of the  $k_{eff} \leq 205$  levels of the hierarchy.

#### 1. The emergence of cells having organelles

The appearance of the structures with  $k_{eff} > 167$  (possibly identifiable as magnetic body parts) should correlate with the emergence of simple eukaryotic cells and organisms, in particular plant cells for which size is larger than  $10 \mu\text{m}$ , which could correspond to  $k_{eff} = 171$  for electron and dark variants of weak gauge bosons.  $k_{eff} = 177$  is the next dark electron level and corresponds

to 80  $\mu\text{m}$  scale. It seems natural to assume that these dark weak bosons do not transform to their  $\hbar_0$  counterparts at these space-time sheets.

Cell nucleus would be the brain of the cell, mitochondria would be the energy plant, and centrioles generating microtubules would define the logistic system. Also other organelles such as Golgi apparatus, ribosomes, lysosomes, endoplasmic reticulum, and vacuoles would be present. These organelles would live in symbiosis by topologically condensing to  $k_{eff} \geq 171$  magnetic body controlling their collective behavior. Centrosomes associated with animal cells would not be present yet but microtubule organizing centers would already be there.

The recent observations show that centrioles are not always in the characteristic T shaped conformation. Daughter centrioles resulting during the replication of mother centriole use first ours of their lifetime to roam around the cell before becoming mature to replicate. A possible interpretation is that they are also life forms and that magnetic body utilizes daughter centrioles to perform some control functions crucial for the future development of the cell. For instance, centrioles visit the place where axonal growth in neurons starts.

Cytoskeleton would act as a counterpart of a central nervous system besides being responsible for various logistic functions such as transfer of proteins along microtubuli. Centrioles give also rise to basal bodies and corresponding cilia/flagella used by simple cells to move or control movement of air or liquid past them. Centriole pair would be also used by the magnetic body to control cell division.

The logistic functions are the most obvious functions of microtubules. Magnetic body would control cell membrane via signals sent through the cell nucleus and communicated to the cell membrane along microtubuli. Basal bodies below the cell membrane and corresponding cilia/flagella would serve as motor organs making possible cell motion. Tubulin conformations representing bits would allow microtubule surface to represent the instructions of the magnetic body communicated via cell nucleus to various proteins moving along the microtubular surface so that they could perform their functions.

TGD based view about long memory recall as communication with geometric past allows also the realization of cellular declarative memories in terms of the conformational patterns. Memory recall corresponds to a communication with geometric past using phase conjugate bosons with negative energies reflected back as positive energy bosons and thus representing an “image” of microtubular conformation just like ordinary reflected light represents ordinary physical object. There would be no need for a static memory storage which in TGD framework would mean taking again and again a new copy of the same file.

Receptor proteins would communicate cell level sensory input to the magnetic body via MEs parallel to magnetic flux tubes connecting them to the magnetic body. We ourselves would be in an abstract sense fractally scaled up counterparts of receptor proteins and associated with dark matter iono-lito Josephson junction connecting the parts of magnetosphere below lithosphere and above magnetosphere. The communication would be based on Josephson radiation consisting of photons, weak bosons, and gluons defining the counterpart of EEG associated with the level of the dark matter hierarchy in question.

### 3. *The emergence of organs and animals*

The emergence of magnetic bodies with  $k_{eff}$  in the range (177, 181, 183, 187, 189, 195, 201, 205) allowing both dark electron and weak bosons could accompany the emergence of multicellular animals. Magnetic body at this level could give rise to super-genome making possible genetic coding of organs not yet possessed by plant cells separated by walls from each other. The super structures formed from centrosomes and corresponding microtubuli make possible complex patterns of motion requiring quantum coherence in the scale of organs as well as memories about them at the level of organs.

### 4. *The emergence of nervous system*

$k_{eff}$  in the range (187, 189, 195, 201, 205) allowing dark electrons and weak bosons gives size scales (.25, .5, 4, 32, 128) cm, which could correspond to the scales of basic units of central nervous system. What would be of special interest would be the possibility of charged entanglement based on classical  $W$  fields in macroscopic length scales. The emergence of the new level means also the integration of axonal microtubuli to “text lines” at the magnetic flux sheets making possible logistic control at the multineuronal level. The conformational patterns of the microtubular surface

would code nerve pulse patterns to bit patterns representing declarative long term memories. An interesting question is whether the reverse coding occurs during memory recall.

### The evolution of magnetic body

For mammals with body size below 1.25 m the levels  $k_{eff} > 205$  cannot correspond to biological body and the identification in terms of magnetic body is suggestive. The identification of EEG in terms of Josephson frequencies suggests the assignment of EEG with these levels.

#### 1. The emergence of EEG

EEG in the standard sense of the word is possessed only by vertebrates and one should understand why this is the case. The value of Josephson frequency equal to 5 Hz requires only  $k_d = 47$  so that something else must be involved. A possible explanation in the framework of the proposed model comes from the following observations.

1. Besides the maximal p-adic scale  $k = 205$  for which electron and weak bosons appears as dark variants the model allows also levels at which only gauge bosons appear as dark particles. From Table 9 one finds that levels  $k \in \{207, 211, 213, 217, 219, 221, 223, 225, 229, 235\}$  are allowed. Could it be that these levels and possibly some highest levels containing both electrons and gauge bosons as dark particles are a prerequisite for EEG as we define it. Its variants at higher frequency scales would be present also for invertebrates. The lowest Josephson frequency coded by the largest value of  $\hbar$  in the cell membrane system determines the Josephson frequency.
2. The membrane potentials -55 mV (criticality against firing) correspond to ionic Josephson energies somewhat above 2 eV energy ((2.20, 2.74, 3.07, 2.31) eV, see **Table ??**). For 2 eV the wavelength 620 nm is near to  $L_e(163) = 640$  nm. Therefore the Josephson energies of ions can correspond to the p-adic length scale  $k = 163$  if one assumes that a given p-adic mass scale corresponds to masses half octave above the p-adic mass scale so that the opposite would hold true at space-time level by Uncertainty Principle. Josephson frequencies  $f_J \in \{5, 10, 20, 40, 80, 160\}$  Hz correspond to  $k_d \in \{47, 46, 45, 44, 43, 42\}$  giving  $k_{eff} \in \{210, 209, 208, 207, 206, 205\}$ .
  - (a) Cerebellar resonance frequency 160 Hz would correspond to  $k = 205$  -the highest level for for which model allows dark electrons (also 200 Hz resonance frequency can be understood since several ions are involved and membrane potential can vary).
  - (b) The 80 Hz resonance frequency of retina would correspond to  $k_{eff} = 206$  -for this level dark electrons would not be present anymore.
  - (c) 40 Hz thalamocortical frequency would correspond to  $k_{eff} = 207$ .
  - (d) For EKG frequencies are EEG frequencies below 20 Hz 12.5 and heart beat corresponds to .6-1.2 second cycle (the average .8 s corresponds to  $k_{eff} = 212$ ).
3. Even values of  $k_{eff}$  are not predicted by the model based on Mersenne primes allowing only odd values of  $k_{eff}$  so that the model does not seem to be the whole truth. The conclusion which however suggests itself strongly is that EEG and its variants identified as something in the range 1-100 Hz, are associated with the levels in at which only dark weak bosons are possible in the proposed model. Note that the size scales involved with EEG would be above the size scale of human body so that we would have some kind of continuation of the biological body to be distinguished from the magnetic body. The time scales assignable to the dark CDs would be huge: for instance,  $k = 205$  would correspond to  $T = 2^{42} \times .1$ s making about 1395 years for electron.

#### 2. Does magnetic body correspond to the space-time sheets carrying dark weak bosons?

The layers of the magnetic body relevant for EEG have have size of order Earth size. Natural time scale for the moment of sensory consciousness is measured as a fraction of second and the basic

$k_d$	$f_1/Hz$	$f_2/Hz$	$f_3/Hz$
0	707	1000	1412
4	177	250	354
6	89	1250	177
10	22.1	31.3	44.2
12	11.1	15.6	22.1
14	5.5	7.8	11.1
16	2.8	3.9	5.5
18	1.4	2.0	2.8
20	0.7	1.0	1.4
24	0.2	0.2	0.3

**Table 7.1:** The Compton frequencies obtained by scaling  $2^{k_d/2}$  from the basic triplet  $k_{eff} = (239, 240, 241)$ . The values of  $k_d$  correspond to those predicted by the model based on Mersenne primes.

building blocks of our sensory experience corresponds to a fundamental period of 1 seconds. This scale appears already at  $\hbar_0$  level for electron CD. The natural question concerns the relationship of the magnetic body to the  $k > 205$  space-time sheets carrying only gauge bosons in the model and having size scale larger than that of biological body. Do they correspond to an extension of biological body or should they be regarded as parts of the magnetic body? The following observations suggest that they could correspond to layers of the magnetic body responsible for the fractal variant of EEG.

1. The primary p-adic time scales (Compton times)  $T(239)$  and  $T(241)$  correspond to frequencies, which are  $2^{\pm 1/2}$  kHz. The geometric average  $k = 240$  corresponds to kHz frequency. Is the appearance of kHz scale a mere accident or do the frequencies assignable to the quark CDs correspond to Compton times  $\propto \sqrt{2^{k_{eff}/2}}$ ?
2. One can apply scalings by  $2^{k_d}$  to the triplet  $(239, 240, 241)$  to get a triplet  $(239 + k_d, 240 + k_d, 241 + k_d)$ . The results are summarized in **Table 7.1**. Clearly the frequencies in question cover also the EEG range. Note that these frequencies scale as  $\sqrt{1/r}$  whereas Josephson frequencies scale as  $1/r$ .

Also ZEG and WEG would appear but in much shorter scales dictated by  $k_{eff}$  and might accompany EEG. Somehow it seems that the effective masslessness of weak bosons below given scale is highly relevant for life. One can of course ask whether some larger Gaussian Mersennes could change the situation. There is a large gap in the distribution of Gaussian Mersennes after  $k = 167$  and the next ones correspond to  $M_{G,k}$ , with  $k$  in  $(239, 241, 283, 353, 367, 379, 457, 997)$  [A1]. The twin pair  $k = (239, 241)$  corresponds to a length scales  $L_e(k)$   $(1.6, 3.2) \times 10^2$  km and the minimum value for  $k_d$  are  $(72, 74)$   $(167 \rightarrow (239, 241)$  transition).

### 3. Long term memory and ultralow Josephson frequencies

What determines the time scale associated with long term memory is a crucial question if one really wants to understand the basic aspects of consciousness.

1. Does the time scale correspond to the size scale of CD assignable to electron scaled by  $r = \hbar/\hbar_0$ ? In this case relatively small values of  $r$  would be enough and  $r = 2^{47}$  would give time scale of  $10^{13}$  s for for electron's CD, which is about  $3 \times 10^5$  years. This does not make sense.
2. Does Josephson frequency define the relevant time scale? In this case the long term memory would require the analog of EEG in the time scale of memory span.  $k_{eff} = 205$  would give 6 ms time scale for memory from the assignment of  $k_{eff} = 163$  to the Josephson photons at  $V = -50$  mV implying  $k_d = 42$ . Minute scale would require  $k_{eff} = 217$ . The highest level  $k_{eff} = 235$  allowed by the model involving only Gaussian Mersennes with  $k \leq 167$  would

correspond to a time scale of 77.67 days (day is 24 hours). For Gaussian Mersennes defined by  $k_{eff} = (239, 241)$  the time scales become about (41.4, 82.8) months (3.4 and 6.8 years). These scales should also define important biorhythms. The claimed 7 years rhythm of human life could relate to the latter rhythm: note that the precise value of the period depends on the membrane potential and thus varies. The presence of the scaled up variants of the by  $k_d \leq 78$  allows longer time spans of long term memory and the scaling defined by  $k_d = 167 - 163 = 4$  scales up the span of long term memories to (54.4, 108.8) years.

#### 4. Cultural evolution

Higher levels in the hierarchy would correspond mostly to the evolution of hyper-genome coding for culture and social structures. Introns are good candidate for the nucleotides involved. The development of speech faculty is certainly a necessary prerequisite for this breakthrough. Already EEG seems to correspond to dark layers of biological body larger than biological body so that one can ask whether the weak bosons and dark electrons in the length scales  $k = 239, 241, 283, 353, 367, \dots$  could be relevant for the collective aspect of consciousness and cultural evolution. Maybe the size scales (175, 330) km and their scaled up variants by  $k_d \leq 78$  might have something to do with the spatial scale of some typical social structure (not city: the area of New York is only 790 km<sup>2</sup>).

### 7.2.7 Plasmoids As Primitive Life Forms Associated With Magnetic Bodies

In TGD framework plasmoids can be regarded as primitive life forms associated with rotating magnetic flux quanta, and it has been demonstrated that plasmoids seem to possess the basic characteristics of a living system [I30]. The plasma in question is dark plasma. BE condensates of ions defining dark plasmas represent more advanced life forms of this kind. Dark plasma oscillations define ideal representations for field patterns inducing ionic (say Ca<sup>++</sup>) waves (by many-sheeted Faraday's law) in turn inducing generalized motor activities.

The possibility of charged entanglement induced by  $W$  MEs and generating Bose-Einstein condensates of exotic ions brings in a genuinely new element to the model of plasmoids discussed earlier as predecessors of biological life [K33, K34]. The notion has been already applied in the model of nerve pulse [K66]. One can speak about non-Abelian holograms at the level of dark matter with  $W$  bosons taking key role in the realization of motor actions and neutral bosons playing similar role in the realization of sensory and memory representations.

#### Plasmoids as rotating magnetic systems

If plasmoids rotate they generate em charge by the effect known already by Faraday but not explained satisfactorily by Maxwell's electrodynamics. In TGD framework vacuum charge density induces radial electric field inducing radial Ohmic current which is not divergenceless and hence charges the rotating magnet. Cell, DNA, and other sub-systems in living matter are usually negatively charged and the underlying reason could be the presence of rotating plasmoids around which biochemical life forms have evolved.

Also Searl device [A17], [H14] discussed in [K92] is a rotating magnetic system. In this case the charging of the system implies an effective loss of weight in Earth's electric field. Searl device is known to develop cylindrical magnetic walls [A17]. According to TGD based model of Searl device [K92], the rotating magnetic walls represent a simple example of a magnetic body containing dark matter. The energy and angular momentum transfer from the magnetic flux walls generated by the rotation to the rotating system is assumed to explain the accelerated rotation of the system.

#### Dark plasma waves

Dark plasma waves have synchronously oscillating spatial patterns. Charge densities correspond to the order parameters of BE condensates of bosonic ions so that the introduction of the ion densities is not an idealization as in the non-quantum situation.

The dispersion relation of dark plasma oscillations in the lowest order approximation reads as

$$f_p = \sqrt{e^2 n / m} ,$$

where  $n$  and  $m$  are the number density and mass of plasma waves. In the case of dark plasma waves  $n$  corresponds to the density defined by the order parameter of the Bose-Einstein condensate of ordinary or exotic ions. The dispersion relation does not depend on wave vector at all so that the plasma wave recurs to the same pattern again and again and therefore provide ideal representations of mental images.

Since the notion of ionic density is not an idealization in case of dark plasma waves, it seems sensible to assign energy quantum to the dark plasma waves. Since plasma frequency is purely classical quantity the plasma energy  $E_p = \hbar f_p$  would scale as  $\hbar$  and an increasing hierarchy of plasma wave energies is predicted. These energies could define the metabolic energy quanta in the case of plasmoid life forms. These quanta can decay to  $\hbar_0$  low energy quanta as they are used.

Plasma wave patterns could provide a realization for the control commands inducing motor activities and the energy of the plasma wave could be sucked from metabolic energy sources by time mirror mechanism (see **Fig.** <http://tgdtheory.fi/appfigures/timemirror.jpg> or **Fig. ??** in the appendix of this book) and dissipated in the realization of motor action as the plasma wave decomposes into  $r = \hbar / \hbar_0$  plasma waves at the lowest level of the hierarchy.

Quite large energies are involved at higher levels of dark matter hierarchy and the question arises whether there exist suitable sources of metabolic energy. The dropping of electrons from  $k = 137$  atomic space-time sheets could provide metabolic energy quantum  $E(137) \simeq 1$  keV. The dropping of electron from  $k = 131$  space-time sheet would liberate energy  $E(131) \simeq 64$  keV. The requirement that plasma wave energies correspond to zero point kinetic energies forces quantization of the densities of ions for Bose-Einstein condensates. Also the cyclotron transition energies of electrons or their Cooper pairs can provide the metabolic energy quanta. Note that metabolic efficiency requires quantization of the densities of Bose-Einstein condensates.

In many-sheeted space-time particles topologically condense at all space-time sheets having projection to given region of space-time so that this option makes sense only near the boundaries of space-time sheet of a given system. Also p-adic phase transition increasing the size of the space-time sheet could take place and the liberated energy would correspond to the reduction of zero point kinetic energy. Particles could be transferred from a portion of magnetic flux tube portion to another one with different value of magnetic field and possibly also of Planck constant  $\hbar_{eff}$  so that cyclotron energy would be liberated. In the following only the “dropping” option is discussed.

A further source of metabolic energy could be dark microwave photons generated by quartz crystals in the rock. Callahan has found that rocks consisting mainly of quartz  $\text{SiO}_2$  serve as a source of bio-photons and that paramagnetic soil implying strong Schumann resonance amplitudes is favorable for the well-being of plants [I37]. Bio-photons could be produced as de-coherence products of dark microwave photons. Interestingly,  $\text{SiO}_2^-$  ion has cyclotron frequency 10 Hz for  $B_{end} = .2$  Gauss equal to the fundamental bio-rhythm and the p-adic frequency  $f(2, 127)$  associated with the memetic code.

It is possible to assign definite time scales to various plasma densities in magnetosphere possibly relevant to consciousness and this in principle makes it possible to build a more detailed view about quantal magnetosphere.

### Dark plasma wave patterns as a tool of bio-control

Dark plasma wave patterns correspond to small deviations of charge densities from the non-equilibrium charge density by exotic ionization. Charge entanglement by  $W$  MEs with the magnetic body is an ideal mechanism for the generation of these deviations.

$W$  ME generates oscillatory entanglement with coefficients which depend on space-time coordinates. In the state function reduction one of the outcomes is a state in which Bose-Einstein condensates in both systems carry exotic nuclear em and weak charges.

The reduction occurs for entire Bose-Einstein condensates of bosonic ions at biological body. The stronger the  $W$  field, the higher the probability that exotically charged BE condensate results. Ionic BE condensates define the pixels of the motor map as well as sensory map and the size of

coherence region determines the pixel size. Similar mechanism works at the level of sensory input to the magnetic body.

Dark plasma waves induce ordinary ionic waves such as  $\text{Ca}^{++}$  waves as asymptotic self-organization patterns which would naturally correspond to generalized motor actions. Plasma wave patterns generate also cyclotron radiation the interaction of which with Josephson junctions induce a sensory representation for these patterns so that the control loop closes. Digital spatial and temporal modulation of the plasma wave patterns makes possible field codes for motor activities induced by ionic waves. Obviously the coding of plasma wave patterns to motor actions would be very robust.

### 7.2.8 Field Representations Of Information Using Codes

As already mentioned, the work of Benveniste [I15, I16], Gariaev [I19], and Persinger [J23] provides evidence for the existence of field codes and for the view that water can learn associations [I8]. The basic distinction as compared to the genetic code is that field codes could be context dependent conventions somewhat like natural languages since magnetic body brings in conscious intelligence and flexibility. Therefore the earlier vision about memetic code [K37] assuming strict duration of the memetic codons could be un-necessarily restrictive.

#### Information theoretic aspects

Code words are names for biological functions which can be very complex.

##### 1. *Associative learning of the code*

Flexibility is the basic property of the field codes. The codes can be therefore context dependent and characterize individual organism rather than being biological invariants. Personal code might well be necessary in order to guarantee that biological body cannot be “possessed” by outsiders. The higher the level of dark matter hierarchy, the higher this flexibility is expected to be (natural language in contrast to primitive signals which are rather universal). The work of [I15] [I15, I16] and the report of Smith about context specified 7-bit code for frequency importing [I11] provide support for the associative learning in water.

Flexibility implies that an associative learning of the code is required. There are two diametrically opposite ways to understand what the establishment of the code could mean.

1. The definitely higher IQ and quantum flexibility of the magnetic body suggests that magnetic body learns by searching the patterns inducing the desired responses of the biological body.
2. Magnetic body could also teach, or rather modify, the biological body to respond in a desired manner to plasma wave patterns. This mode of learning requires plasticity and might be important at the level of brain: associative regions of the cortex of higher primates are indeed known to be highly plastic so that changes of connectivity could make possible this kind of learning. The learning requires feedback circuit. An input signal representing the motor action is dark plasma wave pattern. There is also a motor input modifying the response function of the biological body using already learned code. The feedback is essentially the output allowing to decide about next motor input modifying the response function. Automatic associative learning results if the control loop is made automatic. A fascinating possibility is that this kind of modification could occur at the level of genes as a kind of genetic self engineering.

Quite generally, spin glass degeneracy and classical non-determinism are prerequisites for learning at various levels of dark matter hierarchy. In neuroscience rewards and punishments represented by neurotransmitters and various information molecules are believed to drive the learning.

##### 2. *The information content of code is maximized*

Negentropy Maximization Principle [K50] is expected to pose constraints on the possible codes but it is difficult to imagine deduction of these constraints directly from NMP. The number theoretic model reproducing the genetic code as well as its variants [K22] suggests much more direct approach.

Number theoretical variants of Shannon entropy allow interpretation as positive information measures. The information content of the code should be maximized by assigning to it somehow a statistical ensemble or a set of statistical ensembles. In the model of genetic code the 64 codons labelled by integers in the range 0, ..., 63 and the corresponding amino-acids are labelled by the 18 primes  $p < 64$  and integers 0, 1 which correspond to DNAs labelled by 0, 1. Hence the task reduces to finding an assignment  $n \rightarrow p(n)$ . The prime associated with a given integer from the maximization of negentropy for the entire code. Dynamics is thermodynamics for the partitions of  $n$  to a sum of  $r$  integers,  $r = 1, \dots, n$ . Quantum criticality suggests that the Hamiltonian  $H(r)$  (or rather, Boltzmann weights) can be engineered freely. The negentropy  $N(n)$  is maximum over p-adic negentropies  $N_p(n)$  (formally Shannon entropies) fixing the prime  $p(n)$ .

This principle generalizes to an arbitrary code provided one can label the codewords using integers  $n$  and their images by primes  $p(n)$ . In the model of the genetic code  $n$  codons code for 0, 1 and primes  $p < n$ , whose number  $N(n)$  behaves for large values of  $n$  like  $N(n) \simeq n/\log(n)$ . This is obviously a highly non-trivial prediction about the code. The model as such does not tell anything about how the plasma oscillation patterns are labelled by integers.

The patterns to which codons are mapped should be effectively digital just as in the case of a computer graphics. Dark matter Bose-Einstein condensates react as single particles and serve as natural digits and the number of codons is finite. BE condensate patterns induce patterns of ionic waves (such as Ca++ waves), and if it is only the asymptotic self-organization pattern which matters, the degeneracy of the code follows naturally.

### 3. How the meaning emerges?

Information without meaning is not information. The model based on magnetic body and biological body allows to understand how the meaning of the symbolic signals used in the communications emerges. The biological self-organization process induced by the signal acting as a control signal give rise to a mental image at the level of biological body (symbolic mental image at the level of brain and sensory mental images at the level of sensory organs) shared by the magnetic body via entanglement. This mental image would give the meaning for the signal.

## How magnetic body perceives?

In order to speak about perception as something more than a completely automatic process, it is necessary to assume that the perceiver is an intentional agent receiving sensory input and able to perform motor actions. Magnetic bodies at higher levels of dark matter hierarchy would be a natural identification for the recognizer.

### 1. The general model for motor action and sensory communications

The general model for motor actions and communications of sensory input to the magnetic body relies crucially on magnetic flux quanta connecting system to its magnetic body and Josephson junctions serving the role of sensory receptors. This model was first developed for cell with cell/nuclear membrane serving as Josephson junction and DNA double strand as a basic instrument of motor action allowing to realize motor commands via gene expression. An essential assumption is the presence of quantum critical high  $T_c$  super-conductivity in some finite temperature range for which a good guess is 36-37 °C [K30]. The upper limit of the temperature range would be critical temperature for super-conductivity and lower limit the temperature above which almost vacuum extremal property is possible.

This model allows to develop a model of sensory perception using the patterns of Josephson radiation. The model of Comorosan effect [I41] suggests that even molecules could be carriers of supra currents and that the structures formed by enzymes and substrate molecules contain Josephson junctions. Hence the model might apply even when the perceiving system is the magnetic body of bio-molecule, say that of a molecular motor. In the case of DNA double strand the identification of the candidates for Josephson junctions is obvious.

Josephson junction codes information about all kinds of radiation to the pattern of Josephson radiation. In particular, the dark cyclotron radiation generated by the cyclotron transitions of the cyclotron BE condensates at the magnetic bodies creates a voltage perturbation and thus affects Josephson current in the Josephson junctions assignable with the recognizing system and the resulting Josephson radiation received by the magnetic body contains information about the

cyclotron radiation emitted by the target.

*2. How magnetic body perceives the sensory input from the biological body?*

An important question is how the magnetic body generates the cyclotron radiation to which the biologically important molecules respond. In the vicinity of Earth (say below ionosphere) this radiation could be generated by the ions themselves but at high enough heights it is basically protons and electrons which are present in significant amounts.

An elegant resolution of the problem would be provided by the model of frequency imprinting and entrainment. Exotically ionized super-nuclei formed by protonic strings dropped to magnetic flux sheets are able to mimic ordinary ions. These super-nuclei could also act as receiving antennas and can serve as kind of amplifiers in the recognizing system. Time mirror mechanism would also allow to amplify phase conjugate signal using population reversed cyclotron laser.

*3. Sensory input from biological body as a somatosensory map at magnetic body*

The basic recognition process is related to the recognition of the patterns of Josephson radiation consisting of frequencies  $f_{n,\pm} = nf_c \pm f_J$ . Somehow these patterns must define what might be called somatosensory maps at the level of magnetic body.

The previous work with frequency coding of positions of objects of perceptive field using varying cyclotron frequencies [K69] suggests that the magnetic field at the magnetic flux quanta is slowly varying so that the input at frequency  $f_{n,\pm} = nf_c \pm f_J$  generates resonant cyclotron transitions at a position of the magnetic flux quantum determined by the condition  $\hat{f}_c = f_{n,\pm}$ .

This would map the sensory input to a geometric pattern along magnetic body defined by the varying intensity of induced cyclotron transitions and magnetic body would experience the input from the biological as a kind of bodily sensation. It is quite possible that same sensory input is mapped to several positions at the magnetic body.

The harmonics of “alpha” band would correspond to  $\hat{f}_c = nf_c$  and would correspond to motor areas of the magnetic body disjoint from sensory areas. “beta” and “theta” bands would correspond to  $nf_c + f_J$  and  $nf_c - f_J$  and receive sensory input. This allows two options.

1. The magnetic flux could vary in discrete manner so that  $\hat{f}_c = nf_c$  would correspond to magnetic flux  $n\hbar(k)$ : in this case the harmonics of alpha band would correspond to disjoint flux quanta within which magnetic field varies in a relatively narrow range. In this case EEG bands would have precise geometric correlates.
2. If the magnetic flux has minimal value of  $\hbar(k)$ , the area of the magnetic flux quantum would vary as  $S(n) \propto 1/\sqrt{n}$  by flux quantization. There would be a cutoff in  $n$  since the field strength cannot be too high.

If the magnetic field strength decreases as a function of distance from Earth as one might expect, beta and gamma bands would be nearer to the biological body than theta and delta bands for both options. This conforms with the fact that the EEG activity above alpha band is typically associated with rapid reactions and the time delay due to the sensory communications should be minimal. The magnetic body can extend below the Earth’s surface where the field strength increases. Also the model for EEG leads to the same conclusion: the Josephson junction associated with  $k_d = 44$  level is through the layer formed by ionosphere and lithosphere [K30].

The role of brain would be to construct symbolic representations by abstracting only the essential features of the sensory input so that also pattern completion would become possible. Magnetic body itself would accept the sensory input from brain and body as such.

### Dark plasma wave patterns as motor commands

Since dark plasma waves recur again and again to the same pattern they are ideal for the field representation of codewords representing biological activities. Dark plasma oscillations can induce various ionic waves such as  $\text{Ca}^{++}$  and  $\text{Mg}^{++}$  waves since plasma wave modifies the scalar potential at dark space-time sheets and thus also at ordinary space-time sheets by Faraday law in many-sheeted space-time. Plasma wave pattern generates also a pattern of cyclotron radiation in the magnetic field and its presence is detected at the magnetic body via sensory system so that a motor-sensory feedback loop results.

Dark plasma wave patterns would define self-organizing “motor mental images” assignable to the biological body and perhaps also with motor areas of magnetic bodies since the motor control of magnetic bodies from higher levels is also expected to be present. These self-organization patterns would represent control commands realized in terms of frequencies and spatial field patterns assignable to  $W$  MEs. Digitalization would be implied by the size of the coherent region of the BE condensate making collective quantum phase transition to a state involving plasma oscillation with a probability proportional the intensity of  $W$  field inside coherence region.

The realization of motor action involves  $W$  MEs. Exotic  $W$  bosons behave as massless particles below the weak length scale but above this scale they possess a mass obtained by radically scaling down the mass  $\sim 80$  GeV of the ordinary  $k = 89$   $W$  boson. This suggests that a large metabolic energy of order  $W$  boson mass is needed to generate  $W$  ME and that this energy transformed to the energy of plasma oscillation as charge entanglement is reduced and produces exotic ionization. This metabolic energy could be provided by the dropping of an electron from atomic or sub-atomic space-time sheet to a larger space-time sheet.

### Is it possible to transfer genetic information using field patterns?

The work of Yu. Chen Kangeng gives evidence that the transfer of the genetic information by electromagnetic means is possible [J1]. According to [I18], where the method is summarized, the successful transfer of the genetic information from a donor bio-system to an acceptor system was achieved via high-frequency electromagnetic fields feed repeatedly through the optically-active donor bio-system and then delivered over a long period of time to the receiving bio-system in its early developmental stages. The hybrids created through the irradiation of eggs and seeds with such “genetically loaded” fields are claimed to show very specific mixed characteristics that were transferred to the next generation without need for further irradiation.

It would seem that the donor genome or parts of it are imprinted to the electromagnetic field pattern in the process and that this field pattern is able to modify the target genome.

Nothing precludes the possibility that genes/supergenes/hyper genes at some level of dark matter hierarchy can also code for genetic self engineering since these activities are after all very similar to other genetically coded bio-chemical activities. The computer analogy would be programs writing programs. The engineering genes would be activated by  $W$  MEs inducing plasma oscillation patterns. The claimed effects could be understood if the interaction with genetically imprinted electromagnetic field pattern activates genes inducing genetic self engineering yielding the genetic modifications consistent with the pattern represented by the em radiation.

Magnetic body would receive information about the desired outcome as electromagnetic field patterns emitted by other organisms, most naturally members of the same species. If these modifications are successful, the magnetic body is exposed to this information for long enough time to react and activate  $W$  MEs inducing the genetic program inducing the genetic program leading to the suggested genetic modification.

Hyper-genes integrating groups of organisms to larger wholes would be naturally involved with the mechanism. This mechanism would guarantee a rapid propagation of successful genetic modifications to the entire population and would be much more effective than the slowly occurring selection of random mutations. The possibly existing genes responsible for the genetic self engineering could be also introns and express themselves by activating nuclear RNA and process like reverse transcription.

The mechanism could explain the findings of Sheldrake about learning at the level of species. The observed rather recent emergence of 223 new genes into human genome [I14, I27] could be understood as a genetic self engineering rather than genetic engineering by more advanced civilizations (note however that the higher levels of dark matter hierarchy can be also regarded as “more advanced civilizations” ). A further quite recent mystery discussed in [K37] is that corals seem to possess genes responsible for higher level psychological functions in mammals [I22]: it is very difficult to understand this as an outcome of selective pressures combined with random mutations. The proposed mechanism might explain these genes as a result of genetic engineering.

The basic ingredient of the coral backbone is calcium carbonate  $CaCO_3$ . Salt is in question so that also  $Ca^{++}$  and  $CO_3^{--}$  ions are present.  $Ca^{++}$  could obviously give rise to Calcium waves.  $CO_3^{--}$  has atomic weight  $A = 60$  with cyclotron frequency 10 Hz for  $B_{end} = .2$  Gauss. This frequency defines the fundamental biological rhythm and characterizes also memetic code. It char-

acterizes also effectively 2-dimensional waves closed inside the ionospheric cavity: for  $l^{th}$  harmonic the frequency is  $f = \sqrt{l(l+1)}/2\pi R_E$ ,  $R_E$  Earth's radius, and  $l = 1$  gives 10 Hz frequency. Could the transfer of the genetic information in the Earth's length scale with 126-bit memetic codons be realized as ripples 10 Hz waves make possible genetic self engineering of coral genome?

During the early developmental stages the genome might be plastic enough to allow genetic self engineering. The genetic modification during this period also the most rational option since this gives the best guarantee that the modifications are transferred to the offspring.

## 7.3 Model For Crop Circles

In this section a model for the generation of crop circle formation is constructed. The model relies strongly on the notion of many-sheeted space-time and is deduced from the above described model for living matter in which organisms are quantum controlled by a hierarchy of magnetic bodies.

### 7.3.1 Why Crop Circles Need Not Be Hoax?

There are several findings making it very difficult to believe that all crop circles are hoax, and on basis of these findings it is possible to deduce with high reliability whether a hoax can be in question in a particular case.

1. There are clear alterations in growth nodes in the crop formation areas [H19]. In particular, an expansion of growth nodes relative to normal is observed: this expansion is about 115 per cent for regular and 200 per cent for the irregular crop formations. Also tufts of standing plants within formation have node expansions equal to or exceeding the expansion level in flattened plants.

Expanded nodes contain expulsion cavities which can be understood as resulting from a rapid and intense heating by micro-waves causing pressure buildup [H19]: cellular components have literally blown out through epidermal cell walls. Node expansion is also accompanied by a bending. This suggests that the node expansion makes possible the downing of the crops. It is difficult to believe that artificial generation of crop circles by mechanical means could produce expanded nodes or generate micro-waves.

2. Magnetic material confined to localized, dust coated vortices of radius about .5 meters has been found in two thirds of all cases studied [H16]. In the case studied in [H17] these vortices were located within the boundaries of two larger more typical circular sites of downed plants approximately 15 meters in diameter and 60 meters. Magnetic iron "glaze" of thickness 400-600 microns is composed of fused iron oxide particles of size 2-200 microns and causes coatings of the soil and within interstices of leaves and stems.

The iron particles most probably originate from the fusion crust of a meteor resulting from the heating caused by the entry into the atmosphere. The congealed droplets are known to drift to Earth several days after the major shower and are found surrounding the known iron meteorite falls. The case studied in [H17] occurred few days after Perseid meteor shower 1993. Since the phenomenon is concentrated entirely within the crop formation, it is difficult to believe that crop circle could be a hoax.

3. The growth characteristics have been compared for the seeds taken from the heads inside crop formations and outside them and differences depending on the time of the formation have been found [H19]. For instance, for seeds taken from the crop formations occurring near the late maturity states rate and the uniformity of plant growth were significantly enhanced. Also this is difficult to understand if hoax were in question.

### 7.3.2 Further Facts About Crop Formations

A lot of data about crop formations have been gathered. In the sequel some of the newest data items which can be also found from [H16, H4] are listed.

1. Crop formations need not be only regular, “geometric” formations. Also randomly downed crop formations caused by the interaction with the ionosphere are possible and are actually more frequent than the regular ones [H4]. These two types can be seen as reflecting the character of magnetic flux tube structures in question. Node length increase is 115 *resp.* 200 per cent for the regular *resp.* chaotic formations.
2. Expulsion cavities, lengthening and bendings associated with the growth nodes are common to all formation, and it seems that the bending is caused by the softening of the growth nodes. It has been found that the stems are charged immediately after the emergence of the crop formation and the bending is proportional to the amount of charge. This supports the view that downing is caused by an electromagnetic mechanism. Over-fertilization does not explain downing. Germination abnormalities were mentioned already.
3. A new and very important plant abnormality has been identified. A massive spiralling and twisting of the somatic tissues in the peduncle (stem at the base of the seed head) could not have occurred at the same time as the flattening of the crop [H4]. A continual exposure to radiation, and possibly also an interaction with the ionosphere already at the very early developmental stage, suggests itself.
4. Balls of light (BOLs) have been also observed in crop formation regions: soccer ball sized balls of orange light and tennis ball sized balls of white opaque light in particular [H16, H4]. The witnesses got the impression that BOLs are inspecting the crop formation. BOLs have been observed also before the formation of the crop circles. It would not be surprising if more complex structures formed from BOLs where responsible for the formation of crop circles.
5. Failures of electrical and mechanical equipment in near or flying over crop circles occur more often than normally [H4]: cameras, recording devices, cell phones and even tractors fail to function properly. Electric perturbations caused by the plasmoids are the most plausible cause.
6. Animal and human reactions to crop formations have been studied [H4]. Many animals tend to avoid the formations and animals behave abnormally during the appearance of the crop formations. There are also effects on people: dread, euphoria, experiences of peace and oneness, and feeling of love have been reported. Sound sensations like buzzing noise and crackling footsteps have been reported: these could be induced by micro-wave audition [I23]. That the buzzing noise has been tape recorded once does not however fit with the hypothesis of endogenous micro-wave hearing. Sensations of presence have been reported. Always newly formed crop circles are in question.

### 7.3.3 Existing Models For Crop Formations

Existing models seem to catch a lot about the physics behind the crop circle formations. The standard belief is that ionic currents between ionosphere and Earth’s surface are not possible, and some hitherto unknown mechanism allowing this must be postulated. The models proposed do not address this question but assume plasma currents.

#### Micro-waves induce the node growth and damage

The heat generated during the crop formation should explain the lengthening of the growth nodes and the appearance of the expulsion cavities. The effect is strongest in the growth nodes and weakest in the hollow parts of the stem. The reason is that growth nodes contain a lot of water increasing the value of the dielectric constant and therefore the effectiveness of the micro-wave heating. That crop stem is not scarred can be understood as resulting from the insulating layer of water provided by the plant itself. To get the idea what happens one can put a tomato in micro-wave oven.

Node damage decreases from the center to the edges of the flattened area. The absorption of the micro-wave energy radiated from the center of the flattened area explains this and the exponential decrease of the damage outside the central area defined by the small vortex of diameter about .5 meters. The absorption of radiation by air and water vapour explains the weakening of

the effect. There should be a source of micro-wave radiation in the middle, naturally a plasmoid structure. The damage caused for the growth nodes of the standing crops is larger than for those of flattened crops. The angle of incidence for the micro-wave radiation explains this.

### Plasma leakage between ionosphere and Earth as a basic mechanism

The presence of the iron coating in the soil and parts of crop stem having meteoric origin two thirds of the cases studied [H17, H16] provides an extremely valuable hint for the model builder.

1. The model proposed in [H17] relies on a plasma vortex structure extending from the ionosphere to the crop field and containing spiral like magnetic fields [H17, H16]. The plasma in question cannot be hot. The ionosphere contains however cold plasma in temperature range  $10^2 - 10^3$  K. This plasma vortex would be essentially ordinary air containing swirling ions if it indeed penetrates to Earth. The magnetic field patterns associated with the plasma attract the meteoric iron [H17, H16] and iron glaze would be due to the molten iron created by the reheating of the semi-molten state of iron at the time of the crop impact [H17].
2. This leads naturally to the proposal that the shapes of crop formations reflect the shape of plasma structures involved. Self-organization leads to preferred plasma patterns and the shapes of the simplest crop formations consisting of spirals and circles resemble typical plasma patterns. Also chaotic plasma patterns are possible and explain the irregular crop formations. It has been proposed that the plasmoid structures extend from ionosphere to Earth. Spiral aurorae contain arcs evolving into pairs of counterclockwise vortex sheets that are never stable and never unwind. Spiral auroras map down to along geomagnetic field lines into the ionosphere. Two counterclockwise vortices are involved. Also the so called sprites which connect ionosphere at 100 km height to the height of about 10 km where thunderstorms are generated have been suggested as being associated with the formation of the crop circles.
3. The leakage might be more probable at night time when ionosphere extends to lower heights. Remarkably, at night time the plasma of ionosphere is known to make attempts to penetrate through the boundary of the ionosphere and this induces magnetic perturbations: the Schumann resonances generated in this manner would be essential for generating entanglement between sleeping brains giving rise to multi-brained “stereo consciousness” (compare with the fusion of visual fields of different brain hemispheres giving rise stereo vision).

### Criticism

One can represent counter arguments against the proposed models.

#### *1. Are the ion currents really plasma currents?*

The strongest objections against the proposed models relate to the idea that the plasma structures involved extend from ionosphere to Earth.

1. The existing models assume that the magnetic structure is generated when a plasma leakage from the ionosphere to Earth occurs. However, small plasma balls are seen (BOLs) and the stems of crops have been altered before the occurrence of the crop formation. This would suggest that the magnetic structures responsible for the connection with the ionosphere exist already before the occurrence of the crop formation and that the ionic current is not ohmic.
2. The plasma in question must be cold: the temperature should be around 200 – 300 Kelvins if it equals to the temperature of the lower ionosphere (D and E regions). It is not clear (to me) whether the overall important heating to at least 700 K, required by the melting of the meteoric iron, could really occur at the surface of the soil and at growth nodes. One can also wonder whether the plasma could penetrate down to Earth through the atmosphere without dissipating its energy completely in collisions with the atoms of the atmosphere. An electric field is needed to make the penetration possible and it is not clear whether the field generated by the charge density in the soil is really strong enough. Large horizontal gradients of the electric field would be certainly required in order that a well-defined pattern would result. One could also argue that the plasma becomes neutralized during the travel

to Earth's surface unless the electric field is so strong that it causes ionization. In this case one would have electric discharge analogous to lightning and probably having much higher temperature of about  $10^4$  K for lightning and generating visible light.

3. There is rather fascinating almost explanation for why the crop formations occur repeatedly in some preferred areas, in particular in England [H16]. When water percolates through any porous rock, it loses negative charge to the rock. The soil in England contains a lot of calcium carbonate (chalk). Calcium carbonate enhances this process and generates currents in the soil. Crop formations occur just in these regions. The magnetic fields caused by these currents have been measured both before and after a crop formation and it is found that the magnetic fields disappear after the crop formation. This is just what one might expect to result from the neutralization resulting from the plasma leakage.

This is of course not an explanation for why the crop circles occur in the areas where the soil is negatively charged. As a matter fact, the generation of negative charge tends to lower the potential difference between ionosphere and Earth surface and reduce the probability for the generation of plasmoids connecting ionosphere and soil. On the other hand, if the plasmoids are small sized, say with sizes of order the size of the crop formation, the presence of electrons in the soil could favor their formation. plasmoids with sizes of order micro-wave wave length have been indeed seen! This strongly suggests that the plasmoid like structures are small and cannot be involved with the currents from ionosphere to Earth.

4. There is a strong correlation between sunspot activity and appearance of crop circles [H16]. The density of electrons in the ionosphere increases by a factor 100 from sunspot maximum to minimum. Also this tends to reduce the potential difference between soil and ionosphere: just the opposite would be however expected if the plasma leakage occurs as ohmic current through the ionosphere
5. If the crop formations correspond to the cross sections of plasmoid structures of a vertical size of order 100 km, it is difficult to understand why their sizes vary in so narrow length scale range which is of same order of magnitude as micro-wave wave lengths. The most natural looking proposal would be that plasmoid structures are local, and consist of basic units of size of order micro-wave wave length, and they have been indeed observed (BOLs). This hypothesis however leaves open the mechanism of the ionic leakage from ionosphere to Earth.

*2. Do the shapes of crop formations indeed correspond to the shapes of plasma patterns?*

Although the simplest crop formations resemble plasma patterns, there are also very complex formations, whose generation is difficult to understand. The most famous is the formation coding a rather precise analog of a two-dimensional pattern sent to the interstellar space as a signal and representing information about human civilization. If this case is not a hoax, one must seriously consider the possibility, that conscious intelligence is involved with the generation of the patterns somehow.

*3. What about strange experiences?*

The models do not explain the strange experiences reported by humans nor the avoidance behavior of animals in the vicinity of the crop formations.

### 7.3.4 TGD Based Interpretation Of Crop Circles

The general model for how magnetic bodies control biological body using plasma oscillations of plasmoids allows straightforward interpretation of crop circles.

#### **Do crop circles represent a message?**

One cannot avoid the feeling that crop circles might represent a message by conscious entities much above us in evolution and having several meanings. Perhaps the main intention is to initiate

a thought process challenging the existing dogmas about what life can be in the minds of those individuals who take the enigma of crop circles seriously.

*1. What kind of message the mere appearance of crop circles contains?*

Crop circles could contain several messages besides the obvious visible message. If one forgets the interpretation as fraud, the obvious message is that there must exist intelligent entities responsible for their construction. Various hints suggest that magnetosphere (or perhaps solar magnetosphere) is this entity. If one takes seriously the Chilbolton [H2, H3] and Crabwood [H5, H6] messages, one must however consider the possibility that we are not the only form of biological life controlled by these entities.

*2. What kind of messages plasma wave patterns contain?*

The surface message is the patterns identifiable in terms of sacred geometry for which length ratios involve only rational numbers and square roots of integers. Chilbolton and Crabwood messages contain also surface message as figure and a text written using ASCII code, and according to the proposal of this chapter, also a message telling about the conscious entities responsible for the message, in particular about their genetic codes. Plasma wave patterns could be interpreted in TGD framework also as generalized motor actions, in particular those involving hyper-gene expression of some kind so that also an implicit message about basic control mechanisms of biology would be involved.

*3. What the presence of amorphous  $\text{SiO}_2$  spheres tries to tell?*

Amorphous  $\text{SiO}_2$  spheres are observed around crop circles resulting when molten quartz cools down rapidly.

1. One part of the message could be that quartz, possibly in transparent liquid or amorphous form, is fundamental for life. Since microwaves are also involved with crop circles the message could be that dark microwaves generated by dark quartz crystals serve as sources of metabolic energy.
2. Amorphous  $\text{SiO}_2$  is typically created by lightning strikes in sand. This suggests that lightning strike creates dark plasmoids of which ball lightnings are one particular case and that dark plasmoids melt the sand particles by de-coherence of highly energetic dark microwave photons to ordinary photons. Also magnetized iron of meteoric origin has been found around crop stems.  $\text{Fe}^{++}$  ions would be structural elements of plasmoids. This suggests a model of plasmoids as a Searl machine, that is rotating magnet consisting of meteoric iron.
3. Microwave photons with wavelength of 5 cm at  $k_{em} = 2$  level would have energy of 100 eV and de-coherence to ordinary photons would melt quartz. Perhaps the existence of dark photons is one of the messages. The microwave photons could originate from magnetostatic waves or from decay of plasma oscillations.
4. The region above mantle contains molten quartz and the glass spheres could be interpreted as a message about the possibility of IT life based on dark atoms and molecules.

*4. What it means that the cyclotron frequencies of ions involved with crop circles are in alpha band?*

The cyclotron frequencies of biologically bosonic ions tend to be in alpha band for  $B_{end} = .2$  Gauss. This is true also for some atomic and molecular ions associated with crop circles.

1.  $\text{SiO}_2^-$  ion has cyclotron frequency 10 Hz for the nominal value  $B_{end} = .2$  Gauss. Also  $\text{CO}_3^{--}$  ions associated with calcium carbonate (limestone contains  $\text{CaCO}_3$ ) have cyclotron frequency of 10 Hz. This frequency equals to the fundamental bio-rhythm and the p-adic frequency  $f(2, 127)$  associated with the memetic code.
2. The observed magnetized  $\text{Fe}^{++}$  ions believed to have meteoritic origin have cyclotron frequency of 10.7 Hz.

10 Hz frequency characterizes also effectively 2-dimensional waves closed inside the ionospheric cavity: for  $l^{th}$  harmonic the frequency is

$$f = \frac{\sqrt{l(l+1)}}{2\pi R_E} ,$$

$R_E$  Earth's radius, and  $l = 1$  gives 10 Hz frequency. All this could be seen as a signal that Earth's magnetosphere (and/or its dark variant) and ionospheric cavity are involved in essential manner.

10 Hz is the alpha frequency and corresponds to generalized EEG at  $k_{em} = 4$  level of dark matter hierarchy from the requirement that EEG frequencies correspond to energies above thermal threshold at room temperature. A possible interpretation is that plasmoids responsible for crop circles and having  $k_{em} = 2$  are used as motor instruments by  $k_{em} = 4$  level of dark matter hierarchy which should be also responsible for the control of gene expression. This could also mean that dark quartz plasmoids are a life form inhabiting the Earth's interior.

#### 5. What is the message of claimed genetic modifications?

There is evidence that the crops from crop circles have experienced genetic modifications and this raises the possibility that magnetic body could be performing genetic self engineering.  $\text{CaCO}_3$  is the basic building material of corals (and eye lens by the way) and the presence of genes in corals coding for higher psychological functions [I22] has been already mentioned, and the possibility that electromagnetic field patterns could be imprinted by genomes and could modify the genomes of target organisms [J1] has been already discussed. The question is therefore: Could it be that menetic code words with duration of 1 seconds allow to realize a modification of genome in presence of ions with 10 Hz cyclotron frequency ( $\text{SiO}_2^{--}$  and  $\text{CO}_3^{--}$ )?

### Crop circles as dark plasma wave patterns representing generalized motor actions

Crop circles could result as generalized motor actions of say magnetic body of Earth realized in terms of plasma oscillation patterns associated with plasmoids generated by exotic ionization induced by  $W$  MEs. Macroscopic quantum phenomenon would be in question since the phenomenon would become visible only after state function reduction selecting the exotically ionized branch.

Crop circles would be analogous to nerve pulse patterns and physiological effects induced by  $\text{Ca}^{++}$  wave patterns induced by exotic dark ionization by the generalized Faraday law at visible space-time sheets. Generation of  $\text{Ca}^{++}$  waves could indeed occur since crop circles tend to appear at limestone rich regions containing calcium carbonate  $\text{CaCO}_3$  giving rise to  $\text{Ca}^{++}$  ions. Limestone rich regions are also negatively charged and this could give rise to electronic Cooper pairs responsible for the negatively charge and high  $T_c$  super-conductivity of plasmoids.

Plasma wave patterns are in TGD framework responsible for the generalized motor control, in particular genetic expression. The notion of hyper-genome predicting collective gene expression at the level of say crop field, the vision about great leaps of evolution as the emergence of new levels of dark matter hierarchy at the level of individual organisms, and the fact that  $k_{em} = 4$  level of dark matter hierarchy corresponding to EEG and size of Earth's magnetosphere is necessarily present (time scale of DNA translation corresponds to EEG time scale) suggest that crop circles could also represent patterns of  $\text{Ca}^{++}$  waves as well as  $\text{Mg}^{++}$  waves involved with collective gene expression or even genetic self engineering.

Crop circles could be interpreted as cross sections of scaled up variants of cell structures. The thickness of cell membrane comes as  $\lambda^k L(151)$  for them and  $k_{em} = 2$  would correspond to 5 cm length scale, the wave length of 6 GHz microwaves, assignable naturally to the plasma balls observed near crop circles. The upper bound for the cell size given by  $\lambda k + 1L(151)$  would correspond to 80 m, which is the size scale for the largest crop circles. One possible interpretation is that crop circles represent an evolutionary leap bringing in plasma wave patterns and quantum control in a new length scale.

### TGD based model for plasmoids involved with crop circles as Searl machines?

The model for plasmoids must answer to several questions. Where plasmoids draw their metabolic energy? The patterns of bent crops suggest that plasmoids radiate radially microwave photons inducing the bending of crops. Hence plasmoids should carry the source of microwave photons

with them. What could be this source of the microwave radiation? How plasmoids are able to defy force of gravitation and move? Do plasmoids enter from ionosphere or Earth's interior or are they created at ground?

I have already earlier proposed that plasmoids are essentially Searl machines and that even ADP-ATP machinery could involve Searl machine like molecular device [K41]. Rotating magnets are the essence of the Searl machine. Magnetized iron believed to have meteoric origin has been found around the crop formations and could thus be one building element of the plasmoid. This iron would be naturally at magnetic flux quanta of Earth and would be magnetized by Earth's magnetic field and concentrate around crop stems since flux quanta traverse DNA. Plasmoids need not therefore come from ionosphere.

Magnetostatic waves for electrons in magnetized iron (dark or not) are in the microwave region and could generate dark microwave photons in turn inducing the formation of dark plasma oscillation patterns. The metabolic energy of plasmoid would basically result from dropping of electrons and ions of radial ohmic currents associated with the rotating magnet to larger space-time sheets.

In many-sheeted space-time (see **Fig.** <http://tgdtheory.fi/appfigures/manysheeted.jpg> or **Fig.** 9 in the appendix of this book) particles topologically condense at all space-time sheets having projection to given region of space-time so that this option makes sense only near the boundaries of space-time sheet of a given system. Also p-adic phase transition increasing the size of the space-time sheet could take place and the liberated energy would correspond to the reduction of zero point kinetic energy. Particles could be transferred from a portion of magnetic flux tube portion to another one with different value of magnetic field and possibly also of Planck constant  $h_{eff}$  so that cyclotron energy would be liberated.

In the following early version of the model assigning metabolic energy quantum to the dropping of protons is considered. In [K64] a model of metabolism associating the metabolic energy quantum to the change of cyclotron energy is discussed.

Note that in the case of Searl machine the distances of order .5 m between magnetic walls and their thicknesses of order 5 cm correspond to microwave wavelengths. The scales are same as in the case of crop circles, which supports the view that plasmoids are essentially Searl machines.

#### 1. Basic picture about plasmoids?

Plasmoids are magnetic flux quanta containing Bose-Einstein condensates of various dark ions and electronic Cooper pairs. The flux lines of magnetic field associated with plasmoids are rotating since charged particles in cyclotron Bose-Einstein condensate rotate in the magnetic field whose lines are frozen with the rotating dark plasma. The space-time sheets parallel with the dark space-time sheets of plasmoids contains the rotating return flux which generates a radial electric field with a non-vanishing divergence in turn inducing radial ohmic current and making ordinary space-time sheet negatively charged. It is plausible that these space-time sheets contain rotating magnetic material: dark meteoritic iron from ionosphere is the recent case.

Dark microwave photons provide the metabolic energy for plasma wave patterns. Plasmoid must be able to generate the microwave radiation by some mechanism. Magneto-static waves of electrons in magnetized iron define an excellent candidate for the source of microwave radiation. It seems that dark variants of these waves must be considered now so that dark iron atoms should be in question unless ordinary microwave radiation is able to cohere into dark microwave radiation.

One must understand how plasmoids are able to defy gravitation and move. The negative charge generated by the rotation of magnet provide the plasmoid with a net negative charge and the repulsive force experienced in the electric field of Earth could make it possible to overcome the gravitational force of Earth as it partially does in the case of Searl's machine [K92].

#### 1. Quartz crystal oscillations cannot serve a source microwave photons in the case of plasmoids

Plasmoids must use microwaves as a source of metabolic energy making possible the generation of plasma wave patterns. Plasmoids can be generated even in microwave ovens by using some "seed" having organic origin [H13]. Dark microwave photons could quite generally serve as a source of metabolic energy of plants. Callahan has found that rocks consisting mainly of quartz  $\text{SiO}_2$  serve as a source of bio-photons and that paramagnetic soil implying strong Schumann resonance amplitudes is favorable for the well-being of plants [I37]. For instance, 2 eV bio-photons

could be produced as de-coherence products of dark microwave photons of wavelength about 1.25 mm. The mechanism would also explain the featureless spectrum of bio-photons.

Dark piezoelectric quartz crystals could act as sources of dark microwave photons. Microwave photons with wavelength of 5 cm at  $k_{em} = 2$  level would have energy of 100 eV whereas at  $k_{em=1}$  level the energy would be 0.05 eV rather near to the energy associated with the action potential. The Josephson frequency of the scaled up dark variant of cell membrane is rather near to this frequency too.

If plasmoids generate microwave photons by using oscillating quartz crystals, they should carry the quartz crystals with them. Since quartz crystals should have size scale of microwave wave length, this option does not look plausible.

#### 2. *Magnetostatic waves of electrons in magnets as source of microwave photons?*

Magnetostatic oscillation frequencies do not depend on the spatial pattern of the magnetostatic wave which thus recurs again and again in similar shape. Therefore magnetostatic oscillations are ideal for generating microwave photons responsible inducing plasma oscillation patterns. Magnetostatic frequencies are of order electron's cyclotron frequency. For electron in a magnetic field of order Tesla associated with magnetized iron the cyclotron frequency would be of order 12 GHz corresponding to a wavelength of 3 cm so that orders of magnitude come out correctly. Note that the order of magnitude for the density of dark ions in plasmoid is fixed to a high degree from the requirement that plasma frequency corresponds to the magnetostatic frequency.

Thus plasmoids could consist of rotating magnetized iron blobs of meteoric origin. Lightnings are known to induce the formation of amorphous quartz spheres in sand. This could be understood if lightnings involve plasmoids quite generally. Plasmoids could arrive from the thunder cloud or be created at the ground since meteoric iron can be present at flux quanta everywhere. Ball lightnings would represent a particular case of plasmoid gaining its metabolic energy from the dropping of charged particles to larger space-time sheets.

The size scales for plasma patterns imply that plasmoids must correspond to  $k_{em} = 2$  level of dark matter hierarchy for which microwave photons with 5 cm wavelength correspond to energy of about 100 eV much above the melting temperature of ordinary quartz (note that the cyclotron frequency associated with the magnetized iron determines the size of plasmoid). Hence the dark microwave photons de-cohering to ordinary photons generated by plasmoids can easily melt quartz and explain the generation of amorphous quartz spheres.

#### 4. *Where plasmoids receive their metabolic energy?*

The dropping of charged particles to larger space-time sheets liberating zero point kinetic energy is the mechanism giving rise to the universal metabolic energy quanta in TGD inspired model of living matter and should be at work also now. The radial ohmic currents induced to a rotating magnet generate charge to the magnet which increases until di-electric breakdown occurs. The charging of the rotating magnet provides it with electrostatic energy which in turn can be used as metabolic energy. The actual energy source is the dropping electrons of the ohmic current to larger space-time sheets, which liberates zero point kinetic energy of  $\sim 1$  keV. This mechanism explains the formation of ordinary plasma by ionization of air in the case of Searl machine and could work also now.

I have proposed that Searl machine sucks energy from the dark matter at the magnetic walls. The model for magnetic body as a controller of biological body using ordinary metabolic energy suggests just the opposite. Even if this is the case, the model would still explain the accelerating rotation in terms of the transfer of angular momentum between the Searl device and magnetic walls.

### **Who decides about the geometry of the crop formations?**

The geometry of crop formations should be determined by the intentional action of magnetospheric conscious entities expressed by micro-wave sized plasmoid like life forms (BOLs). It could be also constrained by the geometry of the magnetic flux quanta connecting the crop field to the magnetosphere.

Thus plasmoids would act as intelligent messengers quantum entangled with higher level life forms and carry out only the hard job. This would mean that the crop formation could be build

gradually and even refined in the course of time as the appearance of BOLs indeed suggests. This option is the most plausible one, and suggests that crop formations are an attempt of a conscious magnetospheric (with Earth's interior included) intelligence to tell about its existence.

### What is the mechanism causing the crop formations?

The big picture is following. Magneto-spheric self would be the intentional responsible for the generation of crop circles. It would generate plasmoids by charge entanglement mechanism. The plasmoids propagating along the pattern determined by  $W$  MEs would be somewhat analogous to nerve pulses and  $Ca^{++}$  waves.

The basic observations helping to build the model are following.

1. The light balls observed around crop formations have a natural interpretation as plasmoids. The stems of crops are charged after the emergence of the formation and the amount of charge and the bending of the crop correlate. This conforms with the fact that plasmoid is charged and that the time of presence of plasmoid determines the amount of the bending and the charge transferred to the stems. The prediction is that crop stems should be negatively charged if the charge originates from air. If it corresponds to dark ions transformed to ordinary ions in the region of the plasmoid, the sign of the charge could be also positive.
2. The expansion of the growth nodes involving the generation of expulsion cavities causes the softening of the growth nodes and makes bending possible irrespective of the details of the bending mechanism. Plasmoid could soften first the growth nodes in the crop circle pattern and some other mechanism could course the bending.

#### *1. Is plasma pattern generated by rotational flow of air associated with plasmoids*

Plasmoids involve rotating magnetic field both at dark space-time sheets with the return flux along ordinary space-time sheets. Also ordinary ions are expected to rotate since they experience Lorentz force. This motion could induce the rotation of ordinary air molecules. For centuries it is known that plasma discharge in air causes also a flow of ordinary air known as a corona wind [D8]. Corona wind is believed to be caused by the scattering of plasma ions with the neutral atoms of air. If this belief is correct, the rotating ions of the plasmoid could induce a rotating corona wind.

If so, the purely mechanical explanation for the formation of the crop circle would be in terms of the swirling air containing the ions would cause the downing much like ordinary wind. A model of vortex with rigid body rotation in core region and curl free rotation outside the core region with velocity behaving as  $1/\text{distance}$  has been discussed in [H19]. Downing would occur inside the core region where the plasma is.

The model allows also the formation of narrow ridges in the interior of flattened regions. Two co-operating plasma vortices with opposite directions generate strongly reduced pressure in the region between them and this raises the crops up in this region.

The basic prediction is that the direction of bending should be along the local direction of the corona wind so that the downing pattern should mimic the flow pattern of the vortex: I do not know whether this is the case.

#### *2. Two-step model for the formation of crop circles*

It is not clear whether the pattern of bent crops is consistent with a rotational flow or not. Hence one must consider a more refined model based on an alternative mechanism of corona wind discussed in [K92]. The model is inspired by the experimental finding of Modanese and Podkletnov [H21] that plasma discharge generates unknown radiation with induces motion of test particles but is not attenuated so that the effect is not caused by the absorption of the energy of radiation.

The model relies on the recoil effect resulting from the dropping of electrons of air to larger space-time sheets. The unknown radiation emitted by plasma discharge is identified in terms of (dark) MEs or scalar wave pulses. At least (dark) MEs serve as correlates for Bose-Einstein condensate of (dark) photons. MEs or scalar wave pulses would induce flux tubes to larger space-time sheets inducing the transfer of electrons of ionized air to larger space-time sheets, and the

corona wind would result as a recoil effect. This would most naturally induce corona wind having a constant direction rather than a swirling of the air.

Crop circle would be created in steps decomposing into two sub-steps.

1. Plasmoid moves through some distance and induces the softening of the growth nodes by microwave heating along its track.
2. Plasmoid generates a plasma discharge inducing MEs or scalar wave pulses bending the crops along the direction of its propagation provided it is same as the local direction of the track. If not, nothing occurs. Rotating plasmoids are indeed negatively charged and their charge grows by the presence of radial ohmic current caused by the rotating magnetic field until plasma discharge occurs. Thus this option fits nicely with the model of plasmoid as a Searl machine. The fact that lightnings generate SiO<sub>2</sub> balls in sand could be understood if lightnings create plasmoids.

### What causes the strange experiences?

As already explained, some animals tend to avoid the crop formations and humans have altered states of consciousness in their vicinity, in particular sense of presence. If crop formation involves the presence of a conscious magnetic body, these experiences could be understood to result from the telepathic sharing of mental images by quantum entanglement perhaps mediated by plasmoids playing the role of a medium as in the model of UFO experiences. This view is consistent with the idea that crop circles are messages of magnetospheric conscious entities to human kind about their existence. Telepathic sharing of mental images would involve charge entanglement by  $W$  MEs responsible also for the generation of plasma patterns.

### Acknowledgements

I want to express my gratitude for several persons. In particular, for Tapani Koivula for encouraging me to take seriously UFOs and ETs and for interesting suggestions (in particular, for stimulating the idea that tectonic energy could serve as a “food” of plasmoid like life forms), Martin Keitel for helping me to realize that crop circles are real and telling about the Chilbolton and Crabwood crop circles as well as for concrete help, and for Toni Siira for providing material related to UFOs and for interesting email exchanges. I want also to thank for Jukka Kinnunen for two champaign bottles (the first one for the capital letter code and the second one for the small letter code): I hope that I will sooner or later invent the means of establishing communications with aliens (the third bottle of champaign). I would also want to thank the ITs responsible for these charming Chilbolton and Crabwood crop formations. If I only knew their names! As an underground intellectual myself, I hope that amplitude modulated micro-waves or whatever from my computer could mediate my deep gratitude and warm greetings to this underground intelligentsia.

## 7.4 Dark Matter Hierarchy, Genetic Machinery, And The Un-Reasonable Selectivity Of Bio-Catalysis

One of the most fascinating outcomes of ideas related to the dark matter hierarchy is the notion of inherently dark fractional atom (molecule) generalizing the notion of Bose-Einstein condensate to the fermionic case. These notions might provide an elegant manner to understand the mysteries of DNA replication, transcription, and translation, and more generally, the incredible selectivity of bio-catalysis.

As often, the original idea was not quite correct. I spoke about  $N$ -atoms rather than fractional atoms. In particular, the mass of  $N$ -molecule was  $N$  times larger than that of the ordinary molecule apart from corrections from binding energy. The more precise view about dark matter hierarchy led to the realization that fractionization of all quantum numbers occurs. In the most general case one can have fractional particles with particle number  $n = k/r$ ,  $k = 1, \dots, r$ ,  $r = \frac{\hbar}{\hbar_0}$ . This leaves the model essentially as such at formal level. The model is however much more realistic than the original one since fractional atoms have mass which is never larger than that of

ordinary atom and also conforms with the recent view about the origin of the hierarchy of Planck constants.

### 7.4.1 Dark Atoms And Dark Cyclotron States

The development of the notion of dark atom involves many side tracks which make me blush. The first naïve guess was that dark atom would be obtained by simply replacing Planck constant with its scaled counterpart in the basic formulas and interpreting the results geometrically. After some obligatory twists and turns it became clear that this assumption is indeed the most plausible one. The main source of confusion has been the lack of precise view about what the hierarchy of Planck constants means at the level of embedding space at space-time.

The rules are very simple when one takes the singular coverings assigned to the many-valuedness of the time-derivatives of embedding space coordinates as functions of canonical momentum densities as a starting point.

1. The mass and charge of electron are fractionized as is also the reduced mass in Schrödinger equation. This implies the replacements  $e \rightarrow e/r$ ,  $m \rightarrow m/r$ , and  $\hbar \rightarrow r\hbar_0$ ,  $r = n_a n_b$ , in the general formula for the binding energy assigned with single sheet of the covering. If maximal number  $n_a n_b$  are present corresponding to a full “Fermi sphere”, the total binding energy is  $r$  times the binding energy associated with single sheet.
2. In the case of hydrogen atom the proportionality  $E \propto m/\hbar^2$  implies that the binding energy for single sheet of the covering scales as  $E \rightarrow E/(n_a n_b)^3$  and maximal binding energy scales as  $E \rightarrow E/(n_a n_b)^2$ . This conforms with the naïve guess. For high values of the nuclear charge  $Z$  it can happen that the binding energy is larger than the rest mass and fractionization might take place when binding energy is above critical fraction of the rest mass.
3. In the case of cyclotron energies one must decide what happens to the magnetic flux. Magnetic flux quantization states that the flux is proportional to  $\hbar$  for each sheet separately. Hence one has  $\Phi \rightarrow r\Phi$  for each sheet and the total flux scales as  $r^2$ . Since the dimensions of the flux quantum are scaled up by  $r$  the natural scaling of the size of flux quantum is by  $r^2$ . Therefore the quantization of the magnetic flux requires the scaling  $B \rightarrow B/r$ . The cyclotron energy for single sheet satisfies  $E \propto \hbar q B/m$  and since both mass  $m$  and charge  $q$  become fractional, the energy  $E$  for single sheet remains invariant whereas total cyclotron energy is scaled up by  $r$  in accordance with the original guess and the assumption used in applications.
4. Dark cyclotron states are expected to be stable up to temperatures which are  $r$  times higher than for ordinary cyclotron states. The states of dark hydrogen atoms and its generalizations are expected to be stable at temperatures scaled down by  $1/r^2$  in the first approximation.
5. Similar arguments allow to deduce the values of binding energies in the general case once the formula of the binding energy given by standard quantum theory is known.

The most general option allows fractional atoms with proton and electron numbers varying from  $1/r$  to 1. One can imagine also the possibility of fractional molecules. The analogs of chemical bonds between fractional hydrogen atoms with  $N - k$  and  $k$  fractional electrons and protons can be considered and would give rise to a full shell of fractional electrons possessing an exceptional stability. These states would have proton and electron numbers equal to one.

Catalytic sites are one possible candidate for fractal electrons and catalyst activity might be perhaps understood as a strong tendency of fractal electron and its conjugate to fuse to form an ordinary electron.

#### Connection with quantum groups?

The phase  $q = \exp(i2\pi/r)$  brings unavoidably in mind the phases defining quantum groups and playing also a key role in the model of topological quantum computation [K4]. Quantum groups indeed emerge from the spinor structure in the “world of classical worlds” realized as the space of

3-surfaces in  $M^4 \times CP_2$  and being closely related to von Neumann algebras known as hyper-finite factors of type  $II_1$  [K97].

Only singular coverings are allowed if the hierarchy of Planck constants and corresponding hierarchy of singular coverings follows from the basic TGD. If the integer  $n$  characterizing the quantum phase allows identification with  $r = \hbar/\hbar_0$ , living matter could be perhaps understood in terms of quantum deformations of the ordinary matter, which would be characterized by the quantum phases  $q = \exp(i2\pi/r)$ . Hence quantum groups, which have for long time suspected to have significance in elementary particle physics, might relate to the mystery of living matter and predict an entire hierarchy of new forms of matter.

### How to distinguish between fractional particles and ordinary particles?

The unavoidable question is whether bio-molecules in vivo could involve actually fractional atoms molecules as their building blocks. This raises a series of related questions.

1. Could it be that we can observe only the fusion of of dark fractional fold molecules to ordinary molecules or its reversal? Is the behavior of matter matter in vivo dictated by the dark matter commentn and of matter in vitro by ordinary matter? Could just the act of observing the matter in vivo in the sense of existing science make it ordinary dead matter?
2. If fractional atoms and molecules correspond to the maximum number of fractional quanta their masses are same as for ordinary atoms and molecules and only the different binding energy photon spectrum distinguishes between them. Situation changes all fractional states are possible and one obtains scaled down spectrum as a unique signature.
3. The fusion of fractional molecules to ordinary molecules in principle allows to conclude that fractional molecule was present. Could this process mean just the replacement of DNA in vivo with DNA in vitro?

### 7.4.2 Spontaneous Decay And Completion Of Dark Fractional Atoms As A Basic Mechanisms Of Bio-Chemistry?

The replication of DNA has remained for me a deep mystery and I dare to doubt that the reductionistic belief that this miraculous process is well-understood involves self deceptive elements. Of course the problem is much more general: DNA replication is only a single very representative example of the miracles of un-reasonable selectivity of the bio-catalysis. I take this fact as a justification for some free imagination inspired by the notion of dark fractional molecule.

#### Dark fermionic molecules can replicate via decay and spontaneous completion

Unit particle number for fractional atom or molecule means that the analog of closed electronic shell are in question so that the state is especially stable. Note that the analogy with full Fermi electronic sphere makes also sense. These atoms or molecules could decay to fractional atoms or molecules. with fractional particle numbers  $k/r$  and  $(r - k)/r$ .

Suppose that a fractional molecule with unit particle number decays into  $k/r$ -molecule and  $(r - k)/r$ -molecule. If  $r$  is even it is possible to have  $k = r - k = r/2$  and the situation is especially symmetric. If fermionic  $k/r < 1$  fractional atoms or molecules are present, one can imagine that they tend to be completed to full molecules spontaneously. Thus spontaneous decay and completion would favor the spontaneous replication (or rather fractionization) and dark molecules could be ideal replicators (fractionizers) The idea that the mechanisms of spontaneous decay and completion of dark fractional particles somehow lurk behind DNA replication and various high precision bio-catalytic processes is rather attractive.

#### Reduction of lock and key mechanism to spontaneous completion

DNA replication and molecular recognition by the lock and key mechanism are the two mysterious processes of molecular biology. As a matter fact, DNA replication reduces to spontaneous opening of DNA double strand and to the lock and key mechanism so that it could be enough to understand

the opening of double strand in terms of spontaneous decay and lock and key mechanism in terms of spontaneous completion of fractional particle (-atom or -molecule).

Consider bio-molecules which fit like a lock and key. Suppose that they are accompanied by dark fractional atoms or molecules, to be called dark fractional particles in sequel, such that one has  $k_1 + k_2 = r$  so that in the formation of bound state dark molecules combine to form  $r$ -molecule analogous to a full fermionic shell or full Fermi sea. This is expected to enhance the stability of this particular molecular complex and prefer it amongst generic combinations.

For instance, this mechanism would make it possible for nucleotide and its conjugate, DNA and mRNA molecule, and tRNA molecule and corresponding amino-acid to recognize each other. Spontaneous completion would allow to realize also the associations characterizing the genetic code as a map from RNAs to subset of RNAs and associations of this subset of RNAs with amino-acids (assuming that genetic code has evolved from RNA  $\rightarrow$  RNA code as suggested in this chapter).

As such this mechanism allows a rather limited number of different lock and key combinations unless  $r$  is very large. There is however a simple generalization allowing to increase the representative power so that lock and key mechanism becomes analogous to a password used in computers. The molecule playing the role of lock *resp.* molecule would be characterized by a set of  $n$  fractional particles with  $k_1 \in \{k_{1,1}, \dots, k_{1,n}\}$  *resp.*  $k_2 \in \{k_{2,1} = r - k_{1,1}, \dots, k_{2,n} = r - k_{1,n}\}$ . The molecules with conjugate names would fit optimally together. Fractional molecules or fractional electrons or atoms appearing as their building blocks would be like letters of a text characterizing the name of the molecule.

The mechanism generalizes also to the case of  $n > 2$  reacting molecules. The molecular complex would be defined by a partition of  $n$  copies of integer  $r$  to a sum of  $m$  integers  $k_{k,i}$ :  $\sum_i k_{k,i} = r$ .

This mechanism could provide a universal explanation for the miraculous selectivity of catalysts and this selectivity would have practically nothing to do with ordinary chemistry but would correspond to a new level of physics at which symbolic processes and representations based on dark fractional particles emerge.

#### Connection with the number theoretic model of genetic code?

The emergence of partitions of integers in the labelling of molecules by fractional particles suggests a connection with the number theoretical model of genetic code [K22], where DNA triplets are characterized by integers  $n \in \{0, \dots, 63\}$  and amino-acids by integers 0, 1 and 18 primes  $p < 64$ . For instance, one can imagine that the integer  $n$  means that DNA triplet is labelled by  $n/r$ -particle.  $r = 64$  would be the obvious candidate for  $r$  and conjugate DNA triplet would naturally have  $n_c = 64 - n$ .

The model relies on number-theoretic thermodynamics for the partitions of  $n$  to a sum of integers and genetic code is fixed by the minimization of number theoretic entropy which can be also negative and has thus interpretation as information. Perhaps these partitions could correspond to states resulting in some kind of decays of  $n$ -fermion to  $n_k/r$ -fermions with  $\sum_{k=1}^r n_k = n$ . The  $n_k/r$ -fermions should however not correspond to separate particles but something different. A possible interpretation is that partition corresponds to a state in which  $n_1/r$  particle is topologically condensed at  $n_2/r \geq n_1/r$  particle topologically condensed....at  $n_k/r \geq n_{k-1}/r$ -particle. This would also automatically define a preferred ordering of the integers  $n_i$  in the partition.

An entire ensemble of labels would be present and depending on the situation codon could be labelled not only by  $n/r$ -particle but by any partition  $n = \sum_{i=1}^k n_i$  corresponding to the state resulting in the decay of  $n/r$ -particle to  $k$  fractional particles.

#### Reduction of DNA replication to a spontaneous decay of $r$ -particle

DNA replication could be induced by a spontaneous decay of  $r$ -particle inducing the instability of the double strand leading to a spontaneous completion of the component strands.

Strand and conjugate strand would be characterized by  $k_1/r$ -particle and  $(r - k_1)/r$ -particle, which combine to form  $r$ -particle as the double strand is formed. The opening of the double strand is induced by the decay of  $r$ -particle to  $k_1/r$ - and  $(r - k_1)/r$ -particles accompanying strand and its conjugate and after this both strands would complete themselves to double strands by the completion to  $r$ -particle.

It would be basically the stability of fractional particle which would make DNA double strand stable. Usually the formation of hydrogen bonds between strands and more generally, between the atoms of stable bio-molecule, is believed to explain the stability. Since the notion of hydrogen bond is somewhat phenomenological, one cannot exclude the possibility that these two mechanisms might be closely related to each other. I have already earlier considered the possibility that hydrogen bond might involve dark protons [K31]: this hypothesis was inspired by the finding that there seems to exist two kinds of hydrogen bonds [D11].

The reader has probably already noticed that the participating fractional molecules in the model of lock and key mechanism are like sexual partners, and if already molecules are conscious entities as TGD inspired theory of consciousness strongly suggests, one might perhaps see the formation of entangled bound states with positive number theoretic entanglement entropy accompanied by molecular experience of one-ness as molecular sex. Even more, the replication of DNA brings in also divorce and process of finding of new companions!

### 7.4.3 The New View About Hydrogen Bond And Water

Concretization of the above scenario leads to a new view about hydrogen bond and the role of water in bio-catalysis.

#### What the fractional particles labelling bio-molecules could be?

What the dark fractional particles defining the letters for the names of various bio-molecules could be? Dark fractional hydrogen atoms are the lightest candidates for the names of bio-molecules. The fusion could give rise to the hydrogen atom appearing in hydrogen bond. One could say the fractional hydrogen atoms belong to the molecules between which the hydrogen bond is formed. In absence of bond the fractional atoms would define active catalyst sites. This mechanism would also conform with the belief that hydrogen bonds guarantee the stability of bio-molecules.

This idea is not a mere speculation. The first experimental support for the notion of dark matter [K31] came from the experimental finding that water looks in atto-second time scale from the point of view of neutron diffraction and electron scattering chemically like  $H_{1.5}O$ : as if one fourth of protons are dark [D12, D10, D14, D5]. Dark protons would be identifiable as fractional protons. Of course, also dark hydrogen atoms can be considered.

One can imagine also a second option. The model for [I2] [K38] leads to a rather concrete view about how magnetic body controls biological body and receives sensory input from it. The model relies on the idea that dark water molecule clusters and perhaps also dark exotically ionized super-nuclei formed as linear closed strings of dark protons [K31] perform this mimicry. Dark proton super-nuclei are ideal for mimicking the cyclotron frequencies of ordinary atoms condensed to dark magnetic flux quanta. Of course, also partially ionized hydrogen fractional ions could perform the cyclotron mimicry of molecules with the same accuracy.

One can consider the possibility fractional molecules/atoms correspond to exotic atoms formed by electrons bound to exotically ionized dark super-nuclei: the sizes of these nuclei are however above atomic size scale so that dark electrons would move in a harmonic oscillator potential rather than Coulombic potential and form states analogous to atomic nuclei. The prediction would be the existence of magic electron numbers [K31]. Amazingly, there is strong experimental evidence for the existence of this kind of many-electron states. Even more, these states are able to mimic the chemistry of ordinary atoms [D13, D4, D2]. The formation of hydrogen bonds between catalyst and substrate could be the correlate for the fusion of fractional hydrogen atoms.

If the fusion process gives rise 1/1-hydrogen, its spontaneous decay to ordinary hydrogen would liberate the difference of binding energies as metabolic energy helping to overcome the energy barrier for the reaction. The liberated energy would be rather large and correspond 3.4 eV UV photon even for  $r = 2$  which suggests that it does not relate with standard metabolism. For larger values of  $r$  the liberated energy rapidly approaches to the ground state energy of hydrogen. Note that the binding energy of ordinary hydrogen atom in state  $n = r$  has in the lowest order approximation same energy as the ground state of dark hydrogen atom for  $\hbar/\hbar_0 = r$  so that one can consider the possibility of a resonant coupling of these states.

Fractional protons and electrons have effective charge  $\pm ke/r$  so that the binding regions of catalysts and reacting molecules could carry effective fractional surface charge.

This might relate in an interesting manner to the problem of how poly-electrolytes can be stable (I am grateful for Dale Trenary for pointing me the problem and for interesting discussions). For instance, DNA carries a charge of -2 units per nucleotide due to the phosphate backbone. The models trying to explain the stability involve effective binding of counter ions to the polyelectrolyte so that the resulting system has a lower charge density. The simulations of DNA condensation by Stevens [133] however predict that counter ion charge should satisfy  $z > 2$  in the case of DNA. The problem is of course that protons with  $z = 1$  are the natural counter ions. The positive surface charge defined by the fractional protons attached to the nucleotides of DNA strand could explain the stability.

#### The hydrogen atoms in hydrogen bonds as fractional hydrogen atoms and $H_{1.5}O$ formula for water

The simplest assumption is that the hydrogens associated with hydrogen bonds are actually associated with  $1/1$  type dark hydrogen atoms. This hypothesis has interesting implications and could explain the formula  $H_{1.5}O$  for water in atto-second time scales suggested by neutron diffraction and electron scattering [D12, D10, D14, D5].

The formation of hydrogen bond would correspond to a fusion of name and conjugate name between  $H_{k/r}$ -O-H atom and its conjugate  $H_{(r-k)/r}$ -O-H atom. The resulting pairs would obey the chemical formula  $H_3-O_2$ . Hence the formation of hydrogen bonds would predict the  $H_{1.5}O$  formula suggested by neutron diffraction and electron scattering in atto-second time scale. This holds true only if one has complete pairing by hydrogen bonds. A more plausible explanation is that just the presence of fractional hydrogens implies the effect. Furthermore, the fraction of dark protons can depend on temperature.

#### The roles of water and ordered water in catalysis

The new view about hydrogen bond allows to understand the role of water in biology at qualitative level. For instance, one can

1. tentatively identify “ordered water” as a phase in which all  $H_{k/r}$  atoms and their conjugates have combined to  $H_{1/1}$  atoms,
2. understand why (or perhaps it is better to say “predict that” ) water containing  $H_{k/r}$  atoms acts as a catalytic poison so that the binding sites of catalysts and reactants must be isolated from water unless the water is ordered,
3. justify the belief that gel phase involving ordered water is necessary for biological information processing,
4. understand why hydration causes hydrolysis,
5. understand the instability of DNA against decay to RNA outside nucleus.

A more more detailed sketch looks like following.

1. Suppose that at least part of water molecules appear in form  $H_{k/r}$ -OH and  $H_{(r-k)/r}$ -O-H. These molecules and the molecule  $H_{1/1}$ -OH<sub>2</sub> formed in their fusion has much smaller binding energy than ordinary water molecule and is expected to be unstable against transition to  $H_3O$ . This would suggest that the feed of metabolic energy is needed to generate the dark hydrogen atoms.

Fractional dark water molecules can join pairwise to form  $H-O-(H_{1/1})-O-H \equiv H_3O_2$  with  $H_{1/1}$ -atoms replacing hydrogen in hydrogen bond. Also  $H_{k_1/r}$ -O- $H_{k_2/r}$  molecules are possible and could form closed strings obeying the chemical formula  $O_n(H_{1/1})_n$ . Also open strings with H-O: s at ends are possible. This phase of water might allow identification as “ordered water” believed to be associated with gel phase and be crucial for quantal information processing inside cell. Liquid crystal phase of water could correspond to a bundle of open vertical segments  $H-O_n(H_{1/1})_{n-2}-H$  forming a 2-dimensional liquid (vertical freezing).

2. Exotic water molecules could spoil the action of both catalyst and reactant molecules by attaching to the “letters” in the name of catalyst or reactant so that the letters are not visible and catalyst and reactant cannot recognize each other anymore. Hence binding sites of catalyst and reactant must be isolated from water containing fractional water molecules. This is what Sidorova and Rau [I42] suggest on basis of comparison of specific and non-specific catalysts: non-specific catalysts contain water in an isolated binding volume whereas for specific catalysts this volume is empty. An alternative mechanism hindering water molecules to attach to “letters” is that water is “ordered water” with no fractional water molecules present.
3. DNA is known to be stable against decay to RNA via hydration inside the cell but not outside. Hydration could correspond to the joining of fractional water to sites of DNA transforming it to RNA. Inside nucleus this cannot occur if water is in ordered water phase permanently.

### How the first self-replicators emerged?

The identification of the first self replicator can be seen as perhaps the most fascinating and challenging problem faced by the pre-biotic model builders. Self replicator is by definition an entity which catalyzes its own replication. The analogy with the self-referential statement appearing in Gödel’s theorem obvious.

In TGD framework self replication would reduce to a spontaneous decay of  $H_{1/1}$ -atom to  $H_{k/r}$ - and  $H_{(r-k)/r}$ -atoms and their subsequent completion to  $H_{1/1}$ -atoms

The picture about emergence of self-replicators would be roughly following.

1. The first self-replicating entities would have been plasmoids [I31] generating  $H_{1/1}$  atoms whose presence would have made possible the emergence of the first molecular self replicators. The generation of  $H_{1/1}$  atoms requires metabolic energy feed. In the first approximation the decay of  $H_{1,1}$  to fractional hydrogen atoms does not liberate nor require energy.
2.  $H_{k/r}$  atoms would have replaced some ordinary  $H$ -atoms in some negatively charged molecules  $M_i$  (perhaps MXTP,  $X = A, U, C, G$ ) leading to a spontaneous emergence of linear negatively charged polymers consisting of  $M_i$ . One can imagine a coding in which each  $X$  corresponds to fixed value of  $k$  or collection of the (2 hydrogen bonds or 3 hydrogen bonds depending on  $X$ ). This would make the attachment of  $X$  and its conjugate to form a hydrogen bond a highly favored process.
3.  $H_{k/r}$  atoms would have taken also the role of active binding sites. In ordered water conjugate molecules  $M_{c,i}$  having  $H_{(r-k)/r}$  atoms as labels would have had high probability to attach to the polymers made of  $M_i$ .
4. RNA molecules are good candidates for self-replicators in the presence of ordered water. The phase transition from ordinary to ordered water (which would have developed later to sol-gel phase transition) would have been an essential element of replication.

### The role of water in chiral selection

In the latest New Scientist (when I am writing this) there was a news telling that chiral selection occurs in water but not in heavy water [C4]. The L form of amino-acid glutamate is more stable than R in ordinary but not so in heavy water so that water environment must be responsible for the chirality selection of bio-molecules. The proposed explanation for the finding, whose importance cannot be over-estimated, was following.

1. Water molecules have two forms: orto- and para, depending on whether the nuclear spins of protons are parallel or opposite. Deuterium nuclei are spinless so that heavy water has only single form. In thermal equilibrium the fraction of orto water is 3/4 and para water 1/4.
2. Ortho-water is magnetic and if L form of amino-acid is slightly more magnetic than R, chirality selection can be understood as result of the magnetic interaction with water.

One can of course wonder how extremely short ranged weak interactions could produce strong enough effect on the magnetic moment. The situation is not made easier by the fact that magnetic interaction energies are inherently very weak and deep below the thermal threshold.

It is interesting to find whether these findings could be explained by and allow a more detailed formulation of the TGD based model for water based on the notion of fractional hydrogen atom, the new view about hydrogen bond, and the notion of dark protonic strings forming atomic sized super-nuclei carrying exotic weak charges.

1. Dark matter brings in long ranged exotic weak interactions which can produce large parity breaking effects in atomic and even longer length scales. The long ranged parity breaking weak interactions of the dark protonic super nuclei assignable to amino-acids and water could explain the chiral selection.
2. The magnetic interaction energy is scaled up by  $r$ , so that magnetic interactions could indeed play a key role. Ordinary classical magnetic fields are in TGD framework always accompanied by  $Z^0$  magnetic fields. If amino-acids possess exotic em charge implying also exotic weak charge, one can understand the chiral breaking as being induced by the  $Z^0$  magnetic interaction of aminocids with the dark magnetic fields generated by water molecules or their clusters possessing a net magnetic moment. In heavy water these fields would be absent so that the experimental findings could be understood.
3. The experimental evidence that water behaves as  $H_{1.5}O$  in atto-second time scales means that 1/4: th of protons of water are effectively dark. The notion of fractional hydrogen atom leads to a model of hydrogen bond predicting correctly  $H_{1.5}O$  formula and the dropping of 1/4: th of protons at larger possibly dark space-time sheets. The model also predicts that the mass of  $H - O - H_r - O - H \equiv 2H_{1.5}O$  hydrogen bonded pairs is very near to the mass of 2 water molecules since there are  $r \simeq m_p/m_e$  electrons involved. The paired molecules have three protons and non-vanishing net nuclear spin and thus generate a magnetic field and make hydrogen bonded water a magnetic system. The natural identification would be as dark magnetic field accompanied by  $Z^0$  magnetic field responsible for the chiral selection.

In the case of  $D - O - D_r - O - D$  mass would be by about one proton mass  $m_p$  lower than mass of two  $D_2O$  molecules so that this D-bonded heavy water would look like  $D_{1.25}O$  as far as masses are considered and  $D_{1.5}O$  as far as neutron diffraction and electron scattering are considered. In this case no magnetic field is generated since the nuclear spin of  $D$  vanishes and no chiral breaking results. This picture explains the experimental findings. The model is not equivalent with the proposal of the experimentalists.

4. The model predicts that the protons liberated in the formation of hydrogen bonds drop to larger space-time sheets but does not specify their fate. A strong constraint comes from the requirement that the dropped particles have exotic weak charges acting as sources of the geometrically unavoidable classical  $Z^0$  magnetic field at dark space-time sheets causing the large parity breaking. This constraint is satisfied if the protons form super-nuclei (scaled up variants of nuclei) consisting of protonic strings connected by color bonds involving exotic quark and antiquark at its ends and some of these bonds are charged (of type  $u\bar{d}$  or  $d\bar{u}$ : this could also generate the em charge needed to make the protonic string stable.

## Chapter 8

# Crop Circles and Life at Parallel Space-Time Sheets: Part II

### 8.1 Introduction

There are two especially fascinating crop circle formations: Chilbolton [H2, H3] and [H5] [H5, H6] and this chapter is devoted to the ideas stimulated by the attempts to understand what these formations try to tell to us. It must be emphasized that this chapter is just a play with thoughts contributing positively to my personal intellectual well-being (and perhaps also that of reader), and not meant to irritate skeptics to the border of fit of rage. It must be however added that dark matter hierarchy changes so profoundly the world view that these light hearted and childish speculations represent something which can be only a pale image of the reality which is much more magnificent than we are able to imagine. Most importantly: playing with crazy thoughts can produce also ideas to be taken seriously: in this case the deep idea was that life could have evolved inside Earth in the womb of Mother Gaia shielded from the effects of meteoric bombardments, UV radiation, and too low temperature surface temperature.

#### 8.1.1 Do Chilbolton And Crabwood Messages Provide Information About Aliens?

Chilbolton and Crabwood formations suggests an interpretation as a message from intelligent civilization living at parallel space-time sheets in our solar system. These messages indeed allow to deduce a lot of information about the genetic code and other bio-codes associated with these life-forms.

1. The Chilbolton message suggests strongly the existence of also doublet code and this inspires a simple model for our genetic code allowing to see the triplet code as resulting from much simpler product code by a small symmetry breaking due to the interaction between singlets and doublets. Doublet code would correspond to exotic form of RNA generated also in the simulation of primordial sea by Leslie Orgel [H9] and against which ordinary life forms have immune reaction. Also various alien codes results in the same way. The model suggests strongly that DNA triplets have resulted as a fusion of DNA singlets and doublets defining simpler genetic codes. It turns out that one can deduce surprisingly detailed information about the alien genetic codes. In fact, almost a unique codes result if one accepts the proposed model of the genetic code having symmetries obeyed also by our genetic code.
2. The Chilbolton message tells that also silicon is of fundamental importance for this life-form at DNA level. Crabwood message contains a variant of the genetic code for which the simplest interpretation is that DNA doublets of form  $XT$  are effectively doubled: perhaps doublets of form  $XT_S$  besides  $XT$ , where  $T_S$  denotes a compound of T and silicon, have emerged. This increases the number of DNA triplets from 64 to 80 and thus also the information content of the genetic code. Same could have occurred to amino-acids and increased the number of amino-acid like molecules by three: this in turn would increase the expressive power of the

genetic code. The difference between man and ape is enormous although genetic codes are almost identical. It is difficult to even imagine the level of intelligence of these creatures as compared to that of us.

3. Chilbolton message contains two different DNA (or RNA) strands. This could have several interpretations, not necessarily excluding each other.
  - i) RNA could indeed be asymmetric and one can understand the pre-evolution of life if the RNA strands associated with singlet and doublet RNA were fused to this kind of strands so that translation of both RNAs to pre-amino acid sequences occurred using tRNA which was fusion of singlet and doublet tRNAs and predecessor of recent tRNA.
  - ii) Alternatively, there could be two genetic codes for the same life-form: the 80 DNA-23 amino-acid code would involve silicon. This life-form could even live outside the solar system.
  - iii) There are two separate higher level life-forms perhaps living in symbiosis inside same organism (like mitochondria and cell nucleus inside our cell).
4. Plasmoid like life-forms could correspond to more primitive singlet and doublet codes. The fact that the Sun, whose convective zone contains a magnetic field of order 2 Tesla making it an ideal environment for this life-form, is described to be smaller than in Arecibo message, suggests that this life-form might populate also solar magnetosphere. The plasmoid like life-forms could serve as kind of less intelligent medium like messengers, quantum entanglers, making possible a telepathic sharing of mental images between members of different civilizations. The light balls observed near crop formations would represent this life-form. Also UFOs could be identified as plasmoid like life-forms inducing telepathic encounters with the alien life-forms. Being predecessors of the recent life-forms, plasmoids would generate immune response in higher life-forms: otherwise the direct encounters would be lethal. Even multicellulars formed by nano-bacterium like life-forms [I39, I21] or by their predecessors could be in question.
5. There is some uncertainty concerning the identification of some ASCII code words appearing in the Crabwood message (as Martin Keitel has emphasized in private communications). In the following two possible forms are discussed. In particular, the number of different capital letters is a crucial factor: if it is smaller than 20, one is forced to interpret also capital letter part of the message as associated with 80 DNA, 23 amino-acid code.

Despite these uncertainties, very general symmetries deduced from our own genetic code fix the identification of the alien codes highly uniquely. All these codes result by the same universal mechanism, and are characterized by the same imbedding of the amino-acid space to the DNA space implying that a considerable part of the code is universal. The symmetries are the exact A-G permutation symmetry and the almost exact T-C permutation symmetry for the last base of the DNA triplet, and the approximate decomposition to a product of codes associated with DNA doublets (the first two bases of triplet) and singlets (the third base of triplet). The success of this model inspires the view that molecular life first evolved to form DNA singlets and doublets coding for 2-plet *resp.* 10-plet of “pre-amino-acids”. After that DNA doublets and singlets fused to triplets coding for the ordinary amino-acids, which are perhaps an outcome from the fusion of the two kinds of “pre-amino-acids”.

It is possible to transform the purely formal mathematical model for the evolution of the triplet code as a fusion of singlet and doublet codes to a concrete physical model. This is done in [?] without barely mentioning crop circles. The truth however is that I would have never discovered the model without crop circles.

### 8.1.2 Where Could The Higher Life Forms Reside?

If one forgets Crabwood and Chilbolton messages, then the magnetosphere of Earth is the most natural candidate for the intelligent conscious entity responsible for the crop circles. Even if one takes seriously these messages, it would seem that the magnetosphere of Earth, or perhaps that of Sun, is the most natural identification for the crop circle artist. The question is basically about which life forms the genetic codes can be assigned to.

Chilbolton message can be interpreted as telling that aliens live in the solar system and populate Earth, Mars, and Jupiter. Sun is depicted to be smaller than in Arecibo message. This leaves two options.

1. Higher life forms live in the recent solar system as planetary or intra-planetary (IP) life forms and the small size of the Sun tells that they receive much less solar light. One could consider even the possibility that these life-forms populate also Sun: magnetic spots as analogs of tornadoes are best candidates for self-organizing living systems. The idea about intraterrestrials, the fact that high temperature super-conductivity based on large value of Planck constant suggests critical temperatures in eV range, and the fact that water is key element of life led to propose that there might be underground sea above the core in mantle. What is amusing that this kind of sea with water volume three times that in ordinary seas has been discovered quite recently (<http://time.com/2868283/subterranean-ocean-reservoir-core-ringwoodite/>) at depth of about 600 km to be compared to the depth of core which is about 2900 km. Water is associated with a mineral known as ringwoodite and ordinary sea water could have originated from this water. In [?] I proposed a TGD inspired variant of Expanding Earth model predicting that primordial life could have evolved inside underground water reservoirs defining kind of womb of Mother Earth shielded from meteoric bombardments, UV radiation. Oceans might have emerged when underground water burst to the surface when a quantum phase transition increasing the radius of Earth by a factor of two occurred. This would explain the sudden emergence of highly developed lifeforms in Cambrian explosion.
2. Aliens could also live in a relatively distant geometric future where the radius of the Sun is considerably smaller (long range  $Z^0$  force brings new force in solar dynamics and could allow relatively large and rapid variations of the solar radius, which are indeed observed). Also this option allows intra-terrestrial life, and the civilization of the geometric future could use time mirror mechanism to build crop circles perhaps utilizing simple IT life forms as quantum messengers.

In TGD framework the idea about intra-terrestrial life or more generally, life at high temperatures, is not so crazy as it sounds. Life loves boundaries where the gradients are and energy currents flow. Active life requires also something to manipulate easily and liquid and liquid crystal phases are especially interesting in this respect. Therefore the solid-liquid boundaries in the Earth's interior are especially interesting seats for life-forms. The presence of the small glass balls and of the magnetized iron in crop formations could be interpreted as a message that the transparent molten quartz (glass) in the mantle-core boundary, and molten iron in core-inner core boundary of Earth's interior, perhaps both allowing also liquid-crystal phases, might have replaced water as or could be an additional essential element of life.

The basic objection against high- $T$  life is the instability of organic molecules at high temperatures and the narrow range of temperatures at which higher life forms survive. Two solutions to the problem can be considered.

#### **The option based on effective thermal isolation of space-time sheets**

The earlier scenario was based on the assumption that space-time sheets are effectively thermally isolated and can thus be at widely different temperatures. Assuming that the size of the space-time sheet corresponds to the thermal de Broglie wave length one ends up with the conclusion that  $k = 131$  space-time sheets having size of 1 Angstroms are the carriers of the liquid glass and iron whereas  $k = 137$  atomic space-time sheets could be even in room temperature. This however just an assumption and one might argue that it is better to start from the most pessimistic scenario than one can imagine and assume that the transfer of thermal energy between space-time sheets is possible.

#### **The option based on dark $N$ -atoms**

Dark matter hierarchy provides an alternative, and it seems more convincing, solution to the temperature problem working even when space-time sheets are assumed to have same temperature. The solution is based on the notions of dark  $N$ -atom and  $N$ -molecule discussed in [K45].

The space-time sheets of inherently dark atoms would in this case define  $r$ -fold coverings of  $M^4$ . This would hold true also in the radial degrees of freedom. For radial anyons principal quantum number  $n$  would be replaced by  $n/r$  so that energy levels  $E_n \propto 1/\hbar^2 n^2$  would not differ considerably from those of ordinary atoms. There is  $r$ -fold state degeneracy corresponding to  $r$  sheets of the covering and it is possible to construct  $N$ -atoms analogous to fermionic counterparts of Bose-Einstein condensates. From Fermi statistics  $N$  can have values  $N \in \{1, \dots, r\}$ ,  $r = \hbar/\hbar_0$ . The transition energies of  $N$ -molecules are  $N$ -fold as compared to their normal values so that thermal stability can be achieved even in vibrational and rotational degrees of freedom.  $N$ -atoms and molecules are an essential element of also ordinary TGD inspired quantum biology [K45].

The most fascinating aspect of fermionic  $N$ -atoms is that they make possible to understand DNA replication and lock and key mechanism of bio-catalysis in terms of high probability of fermionic  $N$ - and  $r - N$ -atoms to combine to  $r$ -atom which must be especially stable as a full fermion shell. The emergence of symbolic representations as names of molecules based on sequences of  $N$ -atoms playing the role of letters, and the emergence of molecular sex based on names having  $N$ -atoms as letters and their conjugates having  $r - N$  atoms as letters and combining to  $r$  atoms in molecular marriage.

What would be required that high- $T$  life is based on  $N$ -atoms, which are thermally stable with respect to the transition energies crucial for biological functions. Hence the values  $k$  characterizing the dark matter levels involved should be higher than in bio-sphere and the life in question should be at higher evolutionary level than ours. Mathematician inside me cannot not avoid the temptation of exaggerating that dark life is simply  $r$ -fold covering of ordinary life.

The same mechanism that makes possible high- $T$  life might explain the well-documented ability of people in trance to dance on burning charcoals. Since trance is involved, the idea about phase transition raising the dark matter level of the skin tissue is natural.

This crazy sounding hypothesis is testable. For instance, one could test the presence of  $N$ -molecules in thermal environments in which they are not stable by looking whether radiation associated with molecular transitions resulting as de-coherence of corresponding  $N$ -photons is present. For instance, there is spectroscopic evidence for water in sunspots [E2]. Ordinary water molecules are not stable at temperature range 3000-4500 K so that  $N$ -water molecules could be in question. The only reasonable explanation for the spectroscopic evidence suggesting the presence of water in sunspots [E2] and solid calcium ferrite surface of sun [E8] is in terms of dark  $N$ -atoms stable under the temperatures prevailing in the photosphere. The same evidence extrapolated to the planetary interiors allows to consider seriously the notion of IP. An experimental program checking systematically the presence of spectral lines of molecules not stable at the temperatures of the environment would allow to test the hypothesis and perhaps map the distribution of dark matter.

One could search for IT life-forms and fossils in volcanoes. One could try to detect tectonic waves and sound waves of unidentified origin as signals possibly generated by ITs. One could use "tectonic" radar waves in order to identify possible technological artefacts in the mantle-core layer. In the Chilbolton message a crop circle which appeared one year earlier in the same crop field plays the same role as the image of the radio telescope in the Arecibo message. This forces to ask whether various crop circles represent various technological achievements of ITs or whoever the aliens are.

The appendix of the book gives a summary about basic concepts of TGD with illustrations. There are concept maps about topics related to the contents of the chapter prepared using CMAP realized as html files. Links to all CMAP files can be found at <http://tgdtheory.fi/cmaphtml.html> [L1]. Pdf representation of same files serving as a kind of glossary can be found at <http://tgdtheory.fi/tgdglossary.pdf> [L2].

## 8.2 Chilbolton And Crabwood Messages

In TGD universe parallel space-time sheet are an obvious candidate for the world where the life forms responsible for crop formations and Chilbolton and Crabwood messages live. For reasons already described, these life-forms could control material at a temperature which is quite too hot for ordinary life forms. Since life loves boundary layers, the mantle-core and core-inner core boundary layers are especially promising candidates for the seats of these life-forms.

These life-forms could appear in several varieties. They could be magneto-terrestrials (even in the interior of the planets involved). Also plasmoid like life-forms for which magnetic field strength would be around 2 Tesla from the requirement that electronic cyclotron radiation generates micro-waves serving as the “food” of the plasmoids, are possible. Balls of light (BOLs) of micro-wave wave length size have been indeed observed in the areas of crop formations. Plasmoid life forms could also serve as quantum messengers of these civilizations. This field strength is also favored by the explanation of the typical sizes of the crop formations. Note that solar convective zone carries magnetic fields of this strength: could the smaller size for Sun suggest that solar convective zone is populated by the plasmoid like life-forms and that the civilization itself is something more complex.

### 8.2.1 Chilbolton Message

The crop formation in Chilbolton which appeared in August 2001 [H2, H3] contained a bit image which had the format of the message sent from Arecibo for the first time 27 years ago. The fact that the radio waves from Arecibo cannot have reached their destiny suggests that the message comes from nearby space. The use of the format of Arecibo message would be an ingenious manner to tell that this is indeed the case. This is supported by the fact that the number of planets is same as in our solar system. The use of Arecibo format would be an ingenious manner to tell that the senders are from parallel space-time sheets.

Arecibo message represented a sequence of  $N = 23 \times 73$  bits. The fact that a product of primes is in question was meant to tell to the receiver that the bits represent two-dimensional figure consisting of a graphic array consisting of 73 rows of 23 columns each. Each element of this matrix is either on (1) or off (0). The bits were represented as shifts of the signal between two frequencies in the 2.38 GHz micro-wave band. The beam was aimed at globular star cluster M13, some 22, 800 light years away and consisting of some 300, 000 stars in the constellation of Hercules.

Arecibo message represented basic information about human life in graphic form: which planet we inhabit in our planet system, what our bodies look like and how tall we are, what is the human population of Earth, what our double DNA strand looks like and what is its amount, and what how did the instrument used to send the message look like.

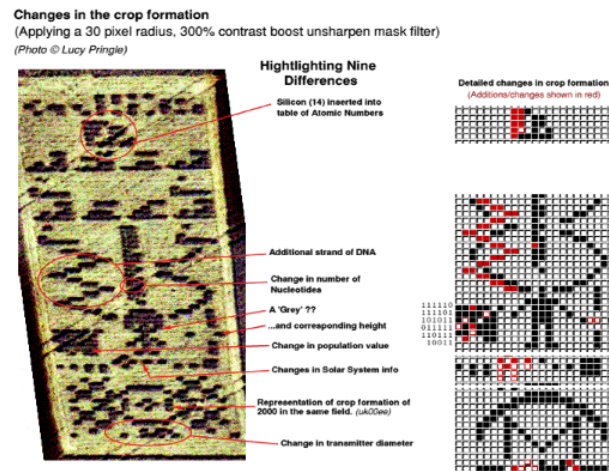

Figure 8.1: Chilbolton crop formation

The differences between Arecibo message and Chilbolton message figures ?? ) are analyzed in [H2, H3].

1. The solar system contains same number of planets but Sun is depicted to be somewhat smaller. Besides Earth also Mars ja Jupiter are told to be inhabited. The most natural inter-

pretation is that ITs (intra-terrestrials) living at mantle-core and core-inner core boundary layers of Earth, Mars and Jupiter are in indeed in question. Liquid or liquid-crystal glass *resp.* iron has replaced water as a medium controlled by these life-forms. The DNA and amino-acids of these life-forms reside at non-atomic space-time sheets which are cold.

This identification also explains why the civilization in question has been able to receive Arecibo message. Arecibo message is sent at micro-wave wave lengths, and micro-waves are amplified by quartz crystals appearing in Earth's crust and correspond to just those wave lengths which induce supra-currents between different space-time sheets. The Chilbolton message also implicitly tells that the populations at the three planets are aware of each other and might be able to communicate. Also this supports the view that some of these life forms are at higher evolutionary level than we.

An objection against this interpretation is that magnetosphere is crucial for life, and since the magnetic field of Mars is very weak, there cannot be any life in Mars. This could indeed be interpreted as being the one reason for why ordinary life has disappeared from Mars: magnetosphere has served as a magneto-immune system preventing the leakage of extra-Martian life-forms to the magnetosphere. Of course, the magnetic field of Mars could be so weak that we have not yet detected it. It is also possible that the magnetosphere of Mars is confined inside the interior of Mars and that Mars is populated only by the simple plasmoid like life forms associated with the magnetic flux tubes corresponding to magnetic fields of strength of order 2 Tesla. Also smaller regions where magnetic field exist are possible. They could reside at the boundary of the Martian counterpart of the "inner-inner" core of Earth having radius of order 300 km (a core of roughly the same size is known to be possessed also by Moon).

2. Besides the elements necessary for our life also silicon (very similar to carbon) is mentioned as an element appearing in DNA. The appearance of silicon in DNA would be natural at mantle-core boundary. The analysis of Crabwood message provides further support for this interpretation.
3. The strands of DNA (or more probably RNA) are depicted as different.
  - (a) The arguments below suggest that the second strand could correspond to a rare variant of DNA in which two triplets of DNA correspond to a full  $2\pi$  twist. In our DNA 10 DNA triplets are required for a full twist containing an integer number of DNAs (this corresponds to the length of cell membrane). This simpler genome defined by 16 RNA doublets replacing 64 RNA triplets could be associated with the plasmoid like life-forms serving as messengers.
  - (b) Alien RNA could indeed consist of asymmetric double strands. The physical model for the evolution of the genetic code developed in [K33, K34] allows this option. A closer inspection of the Chilbolton message suggests that two exotic RNA nucleotides correspond to single singlet RNA nucleotide in the double strand. Therefore the translation of the RNA strands to two different pre-amino-acid sequences could occur as a single process using common pre-tRNA. A further conclusion is that singlet RNA must have been scaled-up by a factor of 2: this might be achieved if the phosphate-sugar backbone contains diphosphates instead of monophosphates. Therefore both RNAs would differ from those dominating the recent life. Pre-amino-acids would not have such an intimate relationship and would represent separate molecular life forms. The higher level life forms could correspond at molecular level to this kind of symbiosis.

The presence of diphosphates would also resolve the basic objection against IT life at mantle-core boundary due to the fact that DNA cyclotron energy ( $f_c$  is about 1 Hz at the Earth's surface) would be below the thermal threshold. The increase of the charge density of DNA per unit length would increase the cyclotron frequency above the thermal threshold.
4. The amount of DNA is somewhat higher than in human genome.

5. The population of these aliens is much higher than that of humans: 21.3 billions. The typical size of aliens, looking like “greys” in UFO mythology, is about one meter.
6. Arecibo message depicts also the radio telescope used to send the message. In Chilbolton message (see **Fig. 8.2** ) the radio telescope is replaced by a crop formation of year 2000 which had appeared in the same field (see figure below) Rather remarkably, this fractal structure brings in mind Earth and its magnetosphere. The interpretation consistent with the overall view is that the construction of this and other crop circles indeed involves entire magnetosphere and that intra-terrestrial life forms are involved with the sending of the message. One can also ask whether crop formations could quite generally be interpreted as pictorial representations of the alien technology?

**Figure 8.2:** The counterpart of the Arecibo antenna in Chilbolton message which corresponds to earlier crop formation brings in mind Earth’s magnetosphere and suggests the presence of intra-terrestrial life.

### Strange silicon is associated with crop formations

If silicon is indeed necessary for the life-forms responsible for the Chilbolton message, it should appear at the space-time sheets in question and might be transferred to our space-time sheets when crop circles are formed. Silicon has been indeed found. Here I represent citation from biologist Dr. Levengood:

Human genetics has been altered by ancient space travelers, then it would be very strange if human genetic makeup were not very similar to that of our parent ETs. There is something about Silicon that is being conveyed in this message. It is not clear at all that Silicon must play a role in the DNA. But it is clear that it plays some important role. Dr. William Levengood, who has pioneered the biochemical assessment techniques that differentiate real crop formations from hoaxes, has found anomalous deposits of Silicon, silicone, and silicates in real crop formations. In one such formation, a layer of extremely pure, micro-crystalline white silicon was found in an 8 inch wide layer 4 under all the affected plants, with no visible soil disturbance to show how the hoaxers put it there. The Silicon was of a purity and crystalline structure that was previously unknown. Furthermore, plants that grew in soil containing this white powdery silicon displayed a 300% to 400% growth in biomass, compared to control plants. The seeds taken from plants that grew in the real formations looked fine, but showed a 40% decrease in seed weight and were dry inside. But, when planted, they germinated and grew tremendously fast, with a deep, lush green color and robust health, compared to control plants. There is something going on with Silicon, and true scientists would respect these clues and examine the real data instead of concluding that it cannot be, therefore it isn’t. That is just bad science.

### Evidence for strange RNA

Chilbolton message could tell that two types of DNAs exist and that for the second DNA 64 DNA triplets have been replaced by 16 doublets. This idea leads to a successful model of genetic code. The simpler DNA would be naturally associated with the plasmoid like life-forms able to serve as messengers.

$k = 157$  is the space-time sheet carrying the magnetic field of about 2 Tesla guaranteeing that electronic cyclotron transitions generate micro-waves serving as “food” of plasmoidic life forms. In the solar magnetosphere magnetic fields of this order of magnitude are common (note that there can be very cold even at the magnetic flux tubes of the convective zone!). Thus Sun might thus be an ideal seat for plasmoid like life-forms residing at the magnetic flux tubes. Sun was represented to be smaller than in the Arecibo message: perhaps this was a hint. The fact that the magnetic field of Earth has been weakening continually might explain why plasmoid like life-forms are appearing into the Earth’s magnetosphere. The fact that Sun’s convective core is an ideal source of plasmoids, would explain why also UFO observations correlate with the sunspot activity which correlates with the flow of plasmoids from Sun.

It has been quite recently discovered that Earth’s interior contains previously unidentified structure with radius of about  $r \sim 300$  km. If the Earth’s magnetic field behaves like dipole field down to these distances, the value of the magnetic field is about 4 Tesla at this distance, and happens to correspond to the field value relevant for the plasmoid like life forms. The many-sheeted model of magnetospheric sensory representations implies that also the magnetic fields at the space-time sheets corresponding to various structures in the Earth’s interior are parts of the conscious magnetosphere. In this region the magnetic field would result via spontaneous magnetization having as a seed the magnetic field created by the spontaneous magnetization of a super-conductor consisting of  $J = 2$  Cooper pairs.

If these plasmoid like life-forms serve as messengers and if abduction experiences are real, then physical signatures for these encounters should exist. In particular, the immune system of the persons who have suffered abduction should be activated against the exotic form of RNA. There is evidence for this. According to [H9], Red Setter, a research biologist, says:

The central part of the Chilbolton pictogram shows that a DNA double helix as found on Earth, with 10 base pairs per turn, has been replaced on one side by a novel single-stranded helix with just 6 bases per turn. I had to work hard for several days, to discover that the single-stranded helix with 6 bases per turn refers to 2', 5'-linked RNA or DNA, as opposed to the normal 3', 5' variety. This is known to hardly any molecular biologist, and I found out only by making an accurate model... There is no other plausible way of constructing a 6-fold helix as indicated. [published research] shows that 2', 5'-linked RNA will form double helices, but prefers to remain single stranded. [Other research] explores the use of 2', 5' RNA as an antiviral drug; it seems we have been exposed to such strange molecules in the past, and have evolved an interferon-RNAase L system against them.

Recall that origin-of-life experiments in the 1980s by Leslie Orgel, found that RNA would often polymerize into two different forms, namely 2', 5' versus 3', 5'; and it was a mystery to chemical evolutionists why 3', 5' was favored on Earth. Note that many abductees remain ill with chronic fatigue, which generally includes a high level of RNAase L; just as if their immune systems have been activated by contact with 2', 5' RNA. The clear implication is that 2', 5' RNA may represent an alternative system of genetic coding to 3', 5' RNA or DNA as found on Earth; and that the makers of the Chilbolton pictogram wished us to understand that fact. Whether a secret band of elite scientists could hoax such a result seems doubtful; since 2', 5' nucleic acids are mentioned rarely in the literature, and nowhere does it say that they form a single-stranded helix with 6 bases per turn. That I found only recently, by painstakingly constructing an accurate model.

### Comparing the simple DNA with that of ours

While building a model for cognitive representations at molecular level I ended up to the following ideas.

1. The regular polygons constructible using only compass and ruler have number  $N$  of sides (and vertices) which is product of a power of two with product of some Fermat primes. The Fermat primes are given by  $F_n = 2^{(2^n)} + 1$ ,  $n = 0, 1, 2, 3, 4$ . One has  $F_0 = 2$ ,  $F_1 = 5$ ,  $F_2 = 17$ , ...  $F_0$ ,  $F_1$  and  $F_2$  define Mersenne primes via the formula  $M_F = 2^F - 1$  and are clearly in special role.

2. Biology is full of helical structures and the hypothesis is that these structures are such that the number of basic units per period (full  $2\pi$  twist) of the helical structure corresponds to the number  $N$  of vertices for above mentioned polygons or to a Mersenne prime. The hypothesis is in principle easily testable.
3. For ordinary DNA the number of DNA base pairs per period is  $30 = 2 \times 3 \times 5$ . This corresponds to 30-gon constructable using only compass and ruler.
4. For the exotic two-base DNA the number of base pairs is  $6 = 2 \times 3$  per period so that this structure corresponds to hexagon and therefore also to a polygon constructible using only compass and triangle. Clearly, this DNA is somewhat simpler in well defined sense and could correspond to the DNA of plasmoid like life-forms for which doublets replace triplets.

## 8.2.2 Crabwood Crop Formation As A Representation Of DNA-Amino-Acid Codes?

For year and day later after the appearance of the Chilbolton formation a new crop circle was found in Crabwood. I am in debt for Martin Keitel for learning about this fascinating formation in a local UFO meeting and also for interesting discussions and for concrete help.

### The message

Crabwood message consists of two parts. An alien picture and a picture representing spiral like bit sequence starting from the center of the picture and proceeding counterclockwise. It has been proposed [H5, H6] that the message is coded using 9-bit code and that 8-bit portions obey ASCII code. With this assumption the message reads as

*Beware the bearers of FALSE gifts&their BROKEN PROMISES.Much PAIN but still time.EELI!UVE.There is GOOD out there.We OPpose DECEPTION. Conduit CLOSING\*

Obviously there are one or two incomprehensible words involved (EELI!UVE). There are also two variants of the message in the net. OPpose appears at Paul Vigay's homepage [H5] and Oppose at at Martin Keitel's homepage [H6]. In the following both options are considered (see **Fig. 8.3**).

One could consider the possibility that the message has much deeper layer than the somewhat oracle-like statement in ASCII code, and that the presence of the little inconsistency might be intended to make clear that a deeper level is involved. What these aliens would like to communicate is something very essential about themselves as a life form. The image of an alien accompanying the bit sequence indeed suggests this. This something very essential could obviously include the code for translating ordinary DNA triplets to amino-acids. Perhaps also the code for translating the exotic RNA doublets to the analogs of amino-acids. These analogs could be even electromagnetic waves. There could be also other codes: just at the time when the Crabwood message had arrived I developed entire hierarchy of cognitive codes based on Mersenne primes and regular polygons constructible using only compass and ruler [K55].

The first guess is that the message should be represented by some universal code. The appearance of  $3 \times 3 = 9$ -bit code words decomposing naturally to 3 sequences of 3-bits suggests that a cognitive code consistent with genetic code might be involved. This guess was very useful in that it led to the identification of the genetic code of exotic RNA and the decomposition of 3 3-bit portions also suggests immediately that information about RNA is in question.

It however turned out that ASCII code is the proper manner to interpret the message, ninth bit serves as a separation sign only. The interpretation relies on extremely general aspects of the ASCII code: capital and small letters correspond to amino-acids and capital and small forms of a given letter denote for the same amino-acid. Control signs denote the amino-acidic counterparts for the code associated with the exotic RNA. The ordering of the symbols does not matter. One could also use different kinds of symbols: only the numbers of various kinds of symbols telling how many code words are mapped to a particular amino-acid (or whatever counterpart of it) matter.

includegraphics[width=10.0cm]/Users/matpitka/figures/crabwood.png

**Figure 8.3:** Crabwood crop formation

### At what space-time sheet do the aliens live?

The number of code words in Crabwood message is  $k = 151$ .  $k = 151$  is the prime coding for the p-adic length scale corresponding to the cell membrane thickness.  $k = 151$  is also associated with the chromosome's helical structure. There is actually a hierarchy of helical structures and  $k = 151$  corresponds to the lowest level of the hierarchy.

1. The first possibility is that  $k = 151$  tells that the DNA and amino-acids of the life-forms in question are at  $k = 151$  space-time sheets rather than at atomic space-time sheets. This would make sense if atomic space-time sheets are hot. This could be the case if these life-forms are ITs. This would also mean that  $k = 151$  refers to the space-time sheet at which super-conductivity is broken. For our life it would be  $k = 137$  space-time sheet.
2. Second, and a more realistic, possibility is that  $k = 131$  space-time sheets with size which is  $1/8$  of the size of the atomic space-time sheets (.1 Angstroms) are also present and correspond to the hot space-time sheets. Alien DNA and amino-acids would reside at atomic space-time sheets at a temperature which might be near to the room temperature. The assumption that the size of the space-time sheet corresponds to the thermal de Broglie wave length for the typical particles involved, is consistent with this assumption, as will be found later.

Option 2) suggests a different interpretation for  $k = 151$ . This length scale corresponds to the cell membrane thickness and a minimum length for DNA double helix such that an integer multiple of full turns results. This might be crucial for the establishment of the genetic code based on DNA triplets. Since the velocity parameter given by the scaling law of homeopathy [K38] is  $v \simeq 6$  m/s for  $k = 151$  and equals to the phase velocity of alpha waves, this space-time sheet must be important for our life too. alpha band in EEG, in particular Schumann resonance, might relate to communications between life forms at  $k = 137$  and  $k = 151$  space-time sheets. The communications with higher level life-forms might relate with the fact that the alpha band in EEG seems to be associated with creativity. If the aliens assume that we know about p-adic physics, this number might be interpreted as a message telling that also these life-forms have cell membranes and all that is made possible by the presence of  $k = 151$  space-time sheet.

### 8.2.3 Ascii Code Interpretation Of The Crabwood Message

The basic hypothesis is that the message uses only the most general aspects of the ASCII code. The very fact that ASCII code and English language is utilized for the construction of the surface message, tells that the civilization is at a higher level than us and knows a lot about us. The one or two incomprehensible code words in EELI!UVE are purposefully added to help to realize that there is a deeper level involved. For OPpose option the illogical use of capital letters could be also seen as a hint that the numbers of the capital and small letters are more important than the grammar.

The hypothesis is that there are at least two codes involved and these codes are represented by capital letters, small letters + special signs. Of course, also combinations of these are possible and it seems that small letters and special symbols indeed appear in a combination.

#### Why ASCII code?

ASCII code table consists of seven 16-element columns. The first two columns correspond to various control signs; the next two columns to various special symbols like ! and & and decimal numbers; the next two columns to capital letters and special signs; the last two columns contain small letters and special signs. The ASCII number runs along the first column to 15, continues along

second column from 16 to 31, etc.... The ASCII numbers of the alphabet run in the alphabetical order and A corresponds to 65 and Z to 90. The ASCII numbers of small letters are obtained by adding number 32 to those of the capital letters and a given small letter is in the same row as the corresponding capital letter and shifted by two columns.

1. *What senders can tell using ASCII message?*

There are several good reasons for using the general features of ASCII code to send the message.

1. 8-bit code is favored because 9th bit must be used as a separator for practical reasons. In fact, all 8-bit code words involved have 0 as the last digit so that if 9: th digit is 1 then this digit combination acts as a natural separator for the code words.
2. The use of the ASCII code allows to tell implicitly that the senders of the message live near to us, and that they have quite a lot of information about us. The presence of the surface message tells that they can even cope with English language. The totally incomprehensible EELI!UVE can be seen as an ingenious manner to signal that there is a deeper layer involved. The presence of the surface message also tells that the ordering of the letters is very probably not important.
3. If only very general features of ASCII code are involved, enormous flexibility results. For instance, the ordering of the code words in the message does not matter, and there is invariance with respect to the permutations of capital letters and 4 special symbols: only the blanco must map to itself under these symmetries. The permutation group is  $S_{20} \times S_{19}$ . This means a huge freedom to construct the surface message. It is hard to believe that average crop circlist could have this kind of skills.

2. *Hints that the message is about genetic code and cannot be random lyric burst*

One can ask whether the selection of the amino-acid-letter correspondence could have been used to convey additional hints telling that the codes are involved.

1. When one replaces the ASCII numbers  $n$  of the various symbols with the symbols which correspond to the number  $n_1 = n \bmod 32$ , one obtains control symbols in the first two columns of the ASCII code table. This operation corresponds to simply the shifting of the column pair to the left so that it replaces the first two columns. Since all capital *resp.* small letters are contained in the column pairs starting from ASCII symbol 64 *resp.* 92 this operation does not mean a loss of information. Same applies to the special symbols appearing in the message. That capital and small letters are mapped to the same control symbols, suggests as a first guess that they might denote the same amino-acid also in the code: this guess turns out to be wrong and is not actually used in the analysis. Control symbols are denoted by two- and three-letter symbols which brings in mind the three letter notation for amino-acids and also the function of amino-acids as bio-controllers, whereas DNA corresponds to the symbolic representations like ordinary letters of the language. It is also interesting that there are  $26=21+5$  capital letters: this brings in mind 20 amino-acids, stopping sign, 4 pairs of micro-wave polarizations, and corresponding stopping sign.
2. Especially intriguing is the appearance of special symbols. There are 20 capital letters and 19 small letters plus the special sign \ which also has ASCII number larger than 64: does this signal for 20 amino-acids also in the case of the small letters? Or is meant to tell that both small letters and special symbols denote for amino-acids? The remaining three special symbols have ASCII numbers in the third column of the ASCII table.
3. The alphabet runs vertically along 16 element columns of ASCII table and A corresponds to 65. The letters H, X, Y, Z, J and @ symbol which corresponds to ASCII number 64 in capital letter column of ASCII table, do not appear as symbols of amino-acids. The symbols H, X, Y, Z and J (ASCII numbers modulo 32 equal to 8, 24, 25, 26, 10) form a *connected* symmetric region in ASCII table (H (J) is connected horizontally to X (Z) at the upper (lower) end of the vertical bar formed by XYZ). Since a random choice of letters would give disjoint set of

**Table 8.1:** Table gives the 3 to 8 columns of ASCII table (the first two columns for control commands have not been included). The ASCII numbers for the symbols appearing in the message are in boldface.

letters, there seems to be a clear systematics in the selection of the letters used to denote amino-acids. Furthermore, there are 7 letters A, B, C, D, E, F, G above H and 5 letters below K: these are the primes characterizing  $M_5$  and  $M_7$  codes.

4. It is perhaps worth of noticing that the strange word UVE in EELI!UVE corresponds to a connected region of ASCII table and the sum of ASCII numbers modulo 32 is  $7^2$  which is 9 modulo 8 and 17 modulo 32. Also the sum of the ASCII numbers modulo 32 associated with EELI equals to  $7^2$ . The total sum of the ASCII numbers modulo 32 is 99 which equals to 3 in modulo 32 arithmetics.
5. The ASCII numbers of the special characters modulo 32 correspond to 0 (blanco), 1, 6, 14, 28. The numbers 6 and 28 are perfect numbers associated with Mersenne primes  $M_2 = 3$  and  $M_3 = 7$  defining genetic code. All these numbers define Fermat polygons. The column of ASCII table containing blanco, !, & and period contains 7+5 other characters, seven characters between & and period. There are four characters between ! and &, whereas the remaining character is below period at the bottom of the column of ASCII table: this brings into mind 4 micro-wave pairs plus stopping sign identification.

### 3. Ideas about how to dis-entangle the message

A fascinating possibility is that the structure of the ASCII table could give further hints about the systematics of the genetic code.

1. Professional biologists might make guesses about what amino-acids the various letters correspond by comparing the code with our genetic code. For instance, the highly degenerate amino-acids might be same for both genomes.
2. The symmetries of the genetic code, in particular the exact A-G symmetry for the last codon might help to deduce the DNA-amino-acid corresponds using the information of message as hint. There are also other approximate symmetries which give strong constraints on the amino-acid-capital letter identification if one assumes that they hold true also for capital letter code. For instance, the amino-acids corresponding to left-right pairs of capital letters have almost as a rule same number of DNAs coding them. By looking what might the corresponding symmetry for our DNA, one could end up with strong constraints for amino-acid-capital letter correspondence. Unfortunately, this approach does not seem to provide much information.
3. The most important hint came from the realization inspired by the message that both our and alien genetic code are in a good approximation products of simpler doublet and singlet codes. This realization might have emerged also from simple number theoretical considerations. One can imagine two possibilities.
  - i) If one counts only real aminoacids  $20 = 10 \times 2$  decomposition suggest a decomposition to doublet could mapping 16 DNA pairs to 10 elements and 4 DNA bases to 2 elements, kind of "pre-amino-acids" serving as formal building blocks of real amino-acids. Exact  $A \leftrightarrow G$  symmetry and only slightly broken  $T \leftrightarrow C$  symmetry for the last base of DNA triplets supports the  $10 \times 2$  product decomposition.
  - ii) If one counts also stopping sign formally as an amino-acid,  $21 = 3 \times 7$  decomposition suggests a decomposition to doublet code mapping 16 DNA base pairs to 7 elements and 4 DNA bases to 3 elements.

This idea also leads to a vision about life being evolved through a development of doublet and singlet codes which then formed a symbiosis.

4. A further guideline comes from the basic idea of Combinatorial Hierarchy model of the genetic code [K37, K45]. The discrete 21-element set of amino-acids and stopping sign can be imbedded to the discrete space of 64 DNA triplets so that there is a unique DNA for each amino-acid serving as kind of a coordinate for it in the space of DNAs. This leads to a geometric view about the genetic code. Most important prediction is that the DNAs associated with amino-acids a predicted to code for these amino-acids in any genetic code.

**Table 8.2:** Numbers of capital letters appearing in the Crabwood message. The number of P: s is 4 for OPpose option and 3 for Oppose option. The number of blancos is correspondingly 10 or 11.

n	1	2	3	4	5	6	7	9
N(alien)	5	7	3	3(2)	1	0	1	1
N(us)	2	9	2	5	0	3	0	0

**Table 8.3:** A comparison of number  $N(n)$  telling the number of proteins coded by  $n$  DNAs for capital letter code and our genetic code.

- Finally, the general structure of the ASCII table in capital letter columns together and the general features of the message give important hints about the identification of the amino-acid-capital/small letter correspondence. It however turned out that the model of the genetic code is almost enough for the deduction of the codes.

### The degeneracies associated with the capital letter code

There are 20 different capital letters with total number of 56: this is consistent with the genetic code and implies that stopping sign is coded by 8 DNAs. There is no need to tell the number of DNA triplets coded to stopping sign because it can be deduced from the known number 64 for DNA triplets.

The message reads as follows

*Beware the bearers of FALSE gifts&their BROKEN PROMISES.Much PAIN but still time.EELI!UVE.There is GOOD out there.We OPpose DECEPTION. Conduit CLOSING\*

The numbers for the appearance of various capital letters are given by **Table 8.2**

Note that the less important amino-acids at the end of the table correspond to largest ASCII numbers. The largest maxima E, I and O could correspond to the 3 amino-acids coded by 6 DNAs in our genome: these amino-acids are leusine, serine and arginine.

Let us denote by  $n$  the number of DNAs coding a given amino-acid: now it corresponds to the number of appearances of a given capital letter in the message. The number  $N(n)$  of amino-acids corresponding to the same value of  $n$  gives overall view about genetic code and about the importance of the amino-acid in question. These numbers are represented in **Table 8.3**.

The lowest row represents the numbers of n-plets for our genetic code. What looks strange is that as many as 8 DNAs are coding the same amino-acid and that stopping sign is also coded by 7 codons for OPpose option and by 8 codons for Oppose option! In fact, the model for our genetic code discussed in [K37, K45] predicts that the number should not be larger than six.

It would seem that the alien genetic code is not so entropic than ours in the sense that the number of DNAs per amino-acid varies much more. The measure for the redundancy is given by the entropy per amino-acid given by  $s = S/N = \sum_n N(n) \log(n) / (N \log(2))$ ,  $N = 20$ : here bit is used as a unit. The entropy achieves maximum, when the degeneracies of all amino-acids are same. The entropy per amino-acid is  $s = 1.42$  bits for our genetic code and  $s = 1.20$  bits for the alien genetic code in case of Oppose option. When stopping sign is regarded as amino-acid, one has  $s = 1.49$  and  $s = 1.28$  for our *resp.* alien genetic code.

1	1	5								

**Table 8.4:** The numbers  $n$  of small letters and special signs appearing in Crabwood message. The number of  $p$ :  $s$  is 1 for OPpose option and 2 for Oppose option.

### The degeneracies of codes associated with small letters and small letters plus special signs

The numbers of the small letters, of blancos besides those associated with the capital letter code, of backslashes (\) (ASCII number is larger than 64) in the message are represented by first four rows of the **Table 8.4** below. The last rows represent the numbers of special signs with ASCII number smaller than 64.

In the case of small letters the identification of the code is not unique. There are three different interpretations depending on whether one

1. includes only small letters giving 18 amino-acids with  $h$  playing the role of stopping sign (this is possible for Oppose option only),
2. whether also the \ appearing in the capital letter column is included giving  $19+1=20$  amino-acids, or
3. whether one includes also special symbols, which gives 23 different amino-acids.

#### 1. Are only small letters included?

There are 19 different small letters in the message. For Oppose option the total number of small letters is  $68 = 4 \times 17 > 64$  so that a variant of the ordinary genetic code cannot be in question. For cognitive codes based on the regular plane polygons constructible using compass and ruler, the number of code words is power of 2 times a product of some Fermat primes. The code word number  $N = 4 \times 17$  obviously corresponds to this kind of code.  $M_{17}$  is also Mersenne prime and in [K55] ) it was speculated that  $M_{17}$  Mersenne codes are realized at DNA level. In the case of OPpose option the number of letters is 67 and this kind of interpretation is not possible.

There are two possible interpretations for this code making sense only for the Oppose option.

1. The first identification for the small letter code is as a modification of the genetic code obtained by doubling of one DNA doublet which turns out to be AA. Chilbolton messages tells that also silicon is fundamental for the alien life at DNA level. This suggests that the modification  $(AA)_S$  of AA involving silicon increases the number doublets to 17 and the number of triplets to 68. This modification obviously increases the information content of the genome.
2. The appearance of the number 4 suggests that the four DNA bases send 17 different signals such that a given signal affects only single amino-acid. The code could tell how many signals affect a given amino-acid. One can deduce the number of the stopping sign signals and can also identify the two amino-acids which are not affected by the signals if one assumes that capital and small forms of a given letter code for the same amino-acid. Interestingly, all the code words involved have ASCII number larger than 64 and smaller than 127, which fits nicely with the assumption that DNA triplets are involved and  $M_7 = 127$  genetic code is involved. Note that the “stopping sign” of this new code might be simply one particular signal rather than actual stopping sign.

n	1	2	4	5	6	9	13
N	6	5	2	2	2	1	1

**Table 8.5:** The numbers  $N(n)$  of amino-acids coded by  $n$  DNAs for pure small letter code for Oppose option.

n	1	2	4	5	6	9	10 (11)	13
N	8(7)	5	2	2	2	1	1 (1)	1

**Table 8.6:** The numbers  $N(n)$  of amino-acids (with stopping sign included) coded by  $n$  generalized DNAs for small letter +\ code with 80 generalized DNAs and 20 amino-acids. Numbers in brackets refer to Oppose option.

If one assumes that small letters label amino-acids and capital and small letters code for the same amino-acid, one can conclude that the letter  $h$  must code for the counterpart of the stopping sign, and the letters  $K$  and  $V$  whose small counterparts are not present in the small letter code correspond to amino-acids not involved with the code in question. Thus only 18 amino-acids would be coded and the expressive power of the genome would be reduced. The number  $N(n)$  of amino-acids coded by  $n$  DNAs is represented in the **Table ??**.

Stopping sign corresponds to degeneracy  $n = 5$ . The above defined entropy of the code is  $s = 1.22$  bits per amino-acid ( $s = 1.43$  for our code) using the formula above and assuming that stopping sign does not contribute. If stopping sign contributes, one has  $s = 1.39$  ( $s = 1.49$  for our code).

*2. Are also blancos and \ included into small letter code?*

If one includes also the 10 (11 for Oppose) blancos left when 7 (8 for Oppose) is reserved for the capital letter code, one has 20 different small letters and their total number is 79. This number is not divisible by 4 as doublet-singlet product form for any code involving DNA triplets would suggest. Also one amino-acid is lacking. There is however the symbol  $\backslash$ , which appears in the columns containing capital letters unlike other special symbols with ASCII number smaller than 64. If one includes it the number of different symbols becomes 21 and their total number is  $20 \times 4 = 80$ . In this case blanco has a natural interpretation as a stopping sign and the letters  $h$  and  $\backslash$  could represent amino-acids different from those coded by our DNA. As a matter fact, it is known that there are more than 20 amino-acids and the 2 additional ones are coded by the DNA of some terrestrial life-forms. One can however wonder what it means that the  $\backslash$  does not belong to the small letter columns but to the second capital letter column. Perhaps this amino-acid, or whatever it is, has a very special role.

The interpretation would be following. The code is obtained by adding 16 new codons to the old ones. If the code results from a product of doublet and singlet codes, this is achieved if the number of doublets increases by four. This could result from the doubling of the base T by silicon modification in case that it appears as (say) the first base of the codon. This would mean that one has also four codons of form  $T_SXY$ .

If one assumes that small letters label amino-acids and capital and small letters code for the same amino-acid, one can conclude that the letter  $h$  and  $\backslash$  code for amino-acids by replacing the amino-acids represented by the letters  $K$  and  $V$ . 20 amino-acids would be coded by the modified DNA. By looking what amino-acids have been replaced with these new ones one could perhaps deduce what amino-acids the letters  $K$  and  $V$  denote.

The number  $N(n)$  of amino-acids coded by  $n$  DNAs is represented in the **Table 8.6**.

Stopping sign corresponds to degeneracy  $n = 10$  ( $n = 11$ ). The above defined entropy of the code is  $s = 1.28$  bits per amino-acid ( $s = 1.42$  for our code) for Oppose option assuming that stopping sign does not contribute. The small value of entropy is due to the large numbers of code words coding for stopping sign and one amino-acid. With stopping sign included the entropy is

	a	b	c	d	e	f	g	h	i	k	l
x	2	2	1	1	13	2	1	5	6	0	2
X	2	2	3	2	8	1	2	0	5	1	3
	m	n	o	p	r	s	t	u	v	w	\
x	1	1	4	1(2)	6	5	9	4	0	1	1
X	2	4	7	4(3)	2	4	2	1	1	1	0

**Table 8.7:** Comparison of numbers of DNAs coding for same amino-acid in small letter code and capital letter code assuming that small letters and capital letters denote the same amino-acid.

$s = 1.39$  bits per amino-acid ( $s = 1.49$  for our code). One can criticize this code for the fact that the large number of DNAs coding stopping sign reduces the information content of the code.

One might think that same amino-acids correspond to a large number of DNA code words in both capital letter and small letter codes. The table below allows to compare capital and small letter codes. The first and third rows denoted by x correspond to small letter code and second and fourth rows denoted by X to the capital letter code.

There indeed seems to be this kind of correlation up to amino-acid coded by p: amino-acids e and i and o correspond to maxima of  $N(n)$ . They could correspond to leucine, arginine and serine which are maximally coded also in our genome. It turns out that the assumption that small and capital letters correspond to each other is not needed in the construction of the small letter code. The assumption of this correspondence would obviously pose serious limitations on the content of the surface message.

3. Do both small letters and special symbols define counterparts of amino-acids for the small letter code?

Since the aliens seem to be more intelligent than us, the idea about higher genetic expressive power seems natural. Also the appearance of two different strands in the Chilbolton message suggests two different genetic codes and there is no reason to assume that these codes would have a same number of amino-acid like molecules.

The observation that the total number of small letters plus special signs is  $24 = 8 \times 3$  and divisible by 3 suggests that the genetic code involves both small letters and special signs and that the code is obtained by a modification of ordinary genetic code by adding 3 new “amino-acids” and yielding the additional expressive power. In fact, the possibly existing decomposition  $3 \times 7$  for amino-acids (perhaps as composites of simpler molecules or in more general sense) might have expanded to  $3 \times (7 + 1)$ , where one new building block of amino-acid involving silicon has appeared and that the 3 special symbols !, &, . with ASCII number smaller than 32 denote these molecules. Alternatively, and actually more convincingly,  $2 \times 10$  decomposition for real amino-acids could have expanded to  $2 \times (10 + 2)$  for generalized amino-acids with stopping sign included now. From the degeneracies for special symbols, the entropy is  $s = 1.22$  bits per “amino-acid” for this kind of code. If one includes also stopping sign one has  $s = 1.30$ .

### Comparison of the information contents of various codes

In [K55] an information measure to the genetic code was associated. This information gain was defined as a difference of two entropies. The first entropy corresponds to situation when there is no correspondence between amino-acids and DNA. This entropy is given by

$$S_{max} = \log(N_{dna}!N_a!) .$$

Here  $N_{dna} = 64$  and  $N_{aa} = 20$  refer to the numbers of DNA triplets and amino-acids. The second entropy is entropy due to the permutation symmetry of codons coding the same amino-acid and defined as

$$S = \log\left(\prod_n n!^{N(n)}\right) ,$$

Code	$(N_{dna}, N_{aa})$	entropy	I
ours:	(64, 20)	45.5	202.1
capital:	(64, 20)	40.5	207.0
small:	$(4 \times 17, 20)$	63.1	201.2
small:	(16+64, 20)	67.9	248.1
small:	(16+24, 23)	75.9	240.5

**Table 8.8:** Table gives entropies and information gains for various codes. For the notation see the text above. Oppose option is used for calculation.

where  $n$  runs over amino-acids but does not include stopping sign. The information gain associated with the establishment of the genetic code is defined as

$$I = S_{max} - S .$$

The **Table 8.8** gives the entropies and information gains for various codes.

### Is there a DNA doublet code present?

It is not obvious whether the codon of the possible exotic genetic code corresponds to 3 bases. If the exotic RNA corresponds to passive RNA as the message suggests, the counterparts of the amino-acids need not be molecules but could be some electromagnetic signals, perhaps topological light rays characterized by polarization direction. The work of Gariaev [I17] and TGD based interpretation for it suggest that four pairs of radio waves with orthogonal polarizations provide the counterparts of the amino-acids. If plasmoid like life-forms are in question, micro-waves are indeed crucial for the metabolic cycle, and one expects that there is genetic control of micro-waves involved. Of course, doublet code could also be realized chemically: nothing precludes the simultaneous presence of both chemical and micro-wave codes.

If a base pair indeed represents single codon, one has  $M_5$  code, and 16 codons must be represented. In case of the ordinary genetic code the number  $M_7 - 1 = 126 = 6 \times 21$  is related to DNA-amino-acid coding with  $N = 21$  representing the number of different amino-acids which stopping sign counted as “amino-acid”. In present case  $M_5 - 1 = 30 = 6 \times 5$  would suggests that 5 appears as a factor in the number  $N + 1$  of “amino-acids” with stopping sign counted effectively as “amino-acid”. There are three possibilities.

1. The fact that doublets code for 10 different “pre-amino-acids” in case of the product code suggests that the number of “pre-amino-acids” plus stopping sign is  $N+1 = 10$ . This option is consistent with the idea that triplet code has emerged as a fusion of doublet and singlet codes with 10 and 2 “pre-amino-acids” respectively. The degeneracies of various “pre-amino-acids” are in this case dictated by the product model for the capital letter code.
2. The effective number for the counterparts of amino-acids is  $N + 1 = 15$ , this would gives code for which 16 base doublets map to 14 counterparts of amino-acids and stopping sign. Two base doublets would map to the stopping sign or some amino-acid and the rest faithfully to amino-acids. The code would be maximally non-degenerate and such a low redundancy does not seem to be plausible.
3. There are  $5 - 1 = 4$  different “pre-amino-acids” plus stopping sign. The ratio of number of DNA doublets to the number of “pre-amino-acids” would be  $16/5 = 3+1/5$  and is rather near to the corresponding ratio  $64/21 = 3+1/21$  for the ordinary genetic code. The interpretation in terms of pairs of orthogonal polarizations for micro-waves might make sense. This code might be realized even at the level of ordinary DNA with pairs of bases forming basic units instead of triplets and it might be possible to test whether the translation of DNA to these “pre-amino-acids” occurs.

!	.	&	\	blanco
1	5	1	1	19

**Table 8.9:** The degeneracies of special signs for Crabwood message.

### Several codes might be associated with special signs and blancos

There are four special signs !, &, \, period, and blanco and the numbers of special signs in the message are given by the following table.

The interpretation of the last code word as \ raises some worries since the ASCII number of \ is larger than 64 whereas the ASCII numbers of other special symbols are smaller than 48. The total number of the special signs in the message is 8, period appears five times. The number of blancos is 19, this makes 27 signs altogether.

In ASCII code blanco is not counted as a symbol, or more precisely, any non-vanishing number of blancos has the same meaning. If the situation is same now, it is possible to add arbitrary number of blancos to adjust the number of the code words such that it tells the prime  $k$  characterizing the life-form in question. This prime could characterize one of the Gaussian Mersennes  $k = 151, 157, 163, 167$  characterizing various kind of biologies just as ordinary Mersennes and Gaussian Mersennes characterize various physics below atomic length scale.

There are several candidates for the code involved with the special signs. To discuss them first some background information about Mersenne codes is needed.

#### 1. Mersenne codes

In TGD [K55] an important class of cognitive codes correspond to Mersenne primes  $M_n = 2^n - 1$  and the number of the code words is  $M_n$  power of  $M_n$  instead of  $2^n$ . This can be understood as follows. In an external  $Z^0$  magnetic field neutrinos suffer spontaneous magnetization and spins become all parallel. This generates a conscious experience. For the configuration in which spins are parallel to  $Z^0$  magnetic field no phase transition occurs and no experience results. Hence this bit sequence is not consciously representable. The mechanism is actually much more general: any spontaneous magnetization or spontaneous electret formation process gives rise to similar representation. This reduces the number of code words to  $2^n - 1$ .

There is a beautiful connection with finite geometries. The finite geometry associated with  $M_n$  has  $M_n$  points whereas projective geometry with the point at infinity added has  $2^n$  points. The point at infinity corresponds to the code word not consciously representable as spontaneous magnetization phase transition.

There is a hierarchy  $M_3 = 7, M_5 = 31, M_7 = 127$  of codes based on Mersenne primes. The number of code words for  $M_n$  is  $2^n - 1$  and corresponds to the number of statements about  $n$  basic statements with the statement which is not representable as a phase transition thrown away. The number of statements consistent with a given atomic statement is  $2^{n-1}$  and is 4, 16, 64 for the three cases  $n = 3, 5, 7$  respectively and corresponds to the number of singlets, doublets, and triplets of DNA bases.

1.  $M_3 = 7$  which appears in the 9-bit code is more primitive than genetic code: the number of DNAs for this code would be 4. The number of the counterpart of amino-acids for this code would be factor of  $M_3 - 1 = 6 = 2 \times 3$  and is 3 most naturally. Single base might could be the counterpart of the DNA triplet.
2. The number of statements consistent with a given atomic statement for  $M_5 = 31$  code is 16 and genetic codons correspond to two pairs of DNA bases. The number of counterparts of amino-acids plus stopping sign is factor of  $M_5 - 1 = 30 = 6 \times 5$  and is 5 most naturally.
3.  $M_7 = 127$  gives rise to 64 statements consistent with atomic statement of 128-element Boolean algebra coded to DNA triplets of the ordinary genetic code. The number of amino-acids plus stopping sign is factor of  $M_7 - 1 = 126 = 21 \times 6$  and is 21.

### 2. $Z_5$ code

The special signs correspond naturally to the four micro-wave counterparts for amino-acids in case of  $M_5$  code. The 16 RNA base doublets would replace RNA triplets as code words in case of the exotic RNA. Of course, this might make also in case of the ordinary RNA. The senders assume that the receiver knows or discovers the number of codons so that there is no need to code the number of codons mapped to the stopping sign. For this option blancos cannot have any meaning.

To get some ideas about what kind of codes are possible notice that in TGD based model of DNA-amino-acid correspondence is induced by an identification of the set  $X$  64 statements of 128-element Boolean algebra consistent with given atomic statement (single bit in bit sequence fixed).  $M_7 - 1 = 126 = 6 \times 21$ -element group  $Z_{126}$  is identified as a subset of the 128-element Boolean algebra. This identification induces automatically a map to the coset space  $Z_{126}/Z_6 = Z_{21}$  representing amino-acids and stopping sign, and the prediction is that the number of DNAs coding given amino-acid cannot be larger than 6. There are 7 different identifications of the set  $X$  so that the identification of DNAs is not unique.

In the case of the special sign code one as  $M_5 - 1 = 30 = 2 \times 3 \times 5$ -element group and code could be determined by similar map. There is quite a number of possible codes the possible factorizations of the number 30:  $Z_2$ -dcode,  $Z_3$ -code,  $Z_5$  code,  $Z_6$  code,  $Z_{10}$ , and  $Z_{15}$  code. Only  $Z_5$   $Z_3$  codes are possible now.

$Z_5$ -code would predict that the number of DNAs coded to same element is not larger than 6. Since the total number of special symbols other than blanco is 8, and the number of DNA doublets is 16, 8 elements are mapped to the "stopping sign". The  $Z_5$  code decomposes the 16 DNA doublets to two classes representing 8 statements consistent with a given statement and the Boolean complement of this set. Second class is mapped to "stopping sign" and the rest 8 are mapped to 8 special symbols appearing in the message. For instance, if one of the bits in the four-bit code of DNA base vanishes, this would act as a stopping sign. One can say, that lie stops the action. The entropy of the code is  $s = \log(5)/4\log(2) = .6$  bits per polarized micro-wave pair.

$Z_5$  code has 16 code words and would be naturally associated with the exotic RNA. The code would assign to each DNA base doublet a pair of polarized micro-waves, 4 states altogether. If one takes seriously the suggestion of the Chilbolton message that passive RNA strand consists of doublets and 2 RNA triplets define a unit for which twist is full  $2\pi$ , one could consider the possibility that this code is associated with the exotic RNA. On the other hand, the approximate decomposition of the triplet code to a product of doublet and singlet codes suggests that this code could be also associated with the doublets formed by the first to RNA bases of the triplets and realized also in life as we know it.

### 3. $Z_3$ code as dual of $Z_5$ code

For the proposed  $Z_5$  code the second half of DNA doublets are totally passive, and one could argue that this cannot make sense: there must be some code involved also with these DNA doublets.  $Z_3$  code is obviously what comes first in mind. TGD version for this code would predict that the number of elements mapped to a given element is not larger than 10 and is therefore possible. Now only !, & and period are counterparts of amino-acids and if stopping sign like action is at all involved it could correspond to period.  $Z_3$  code requires that \ does not represent a counterpart of amino-acid for  $Z_3$  code. That \ has ASCII number larger than 64 unlike the other three special symbols could be regarded as a signal for this.

The total number of elements mapped to  $Z_3$  by  $Z_3$  code would be 7 rather than 16. This is consistent with the idea that the DNA doublets which are passive with respect to  $Z_5$  code are active with respect to  $Z_3$  code, and that the DNA doublet which corresponds to a bit sequence 0000 is passive with respect to both codes. This conforms with the general ideas about how codes are realized consciously. In the realization based on phase transition the bit sequences consisting of say zeros only is not consciously representable and now it would correspond to the DNA doublet corresponding to 0000 sequence. In the proposed correspondence between DNAs and bit sequences this would correspond to GG.

A possible realization of these codes is in terms of pairs of micro-wave polarizations. Gariaev has found empirical support for the presence of this kind of code of this kind (radiation of laser beam with polarized coherent light generates polarized radio waves [I17] ) and I have proposed how this kind of codes might be possibly realized [K55]. The physical action of the micro-waves would

be induction of bridges between magnetic flux tubes and  $k = 151$  space-time sheets making leakage of super-conducting ions possible and generating thus kind of dynamical piece of wire in many-sheeted current circuitry responsible for homeostasis. In [K44] various aspects of the micro-wave mechanism are discussed.

For  $Z_5$  code all polarization pairs would be active. For the  $Z_3$  code micro-wave pair would induce conscious effect only if at least one polarization is in a selected direction. Logical operation OR for the two bits represented by micro-wave polarizations would be in question

#### 4. $Z_3^3$ code for DNA triplets

The interpretation of the 19 blancos as representing stopping sign would imply that the number of code words is  $19 + 8 = 27 = 3^3$ , which brings in mind the number of bits of the code word of the message. This interpretation does not require the assumption that we already have discovered the micro-wave code. In this case one could consider of assigning  $M_2 = 3$  code to each DNA of DNA triplet. The 3 statements would correspond to all DNAs except the one represented by 00, G is good candidate for this DNA.

The 2 statements consistent with a given statement of each four-element Boolean algebra associated with  $M_2 = 3$  would define  $2 \times 2 \times 2 = 8$  statements mapped to the four signals and the remaining 19 statements would be mapped to stopping sign. Translation process would stop to a lie! The code could be associated with the checking whether each base of triplet belongs to the set of two allowed ones, say A or G.

For the proposed identification  $A = 10$ ,  $T = 01$ ,  $C = 11$ ,  $G = 00$ , the appearance of G(uanine) in the triplet would mean that triplet is mapped to the counterpart of stopping sign (does not generate micro-wave pair at all perhaps) This code would be naturally associated with the ordinary DNA. I have proposed family of codes based on Mersenne primes and associated with DNA in [K55]. This interpretation would bring in  $M_2^3$  code,  $M_3^3$  code with  $7^3$  code words inspired by the 9-bit code words would have 64 DNA triplets in the role of amino-acids.

## 8.3 What Can One Conclude About Aliens?

In the sequel "aliens" refers to the life forms whose genetic code Crabwood message is assumed to represent. The basic question concerns the identity of aliens.

### 8.3.1 Intra- Or Futuro-Terrestrials?

The fact that the Chilbolton message has appeared so soon after the sending of Arecibo message could mean two things.

#### Intra-planetary...

If the constructors of crop circles have received Arecibo message telling about us the, the civilization in question can be at most at a distance of few light decades. Even more, Chilbolton message tells that the aliens live at Earth, Mars and Jupiter and perhaps even in Sun. The Sun is smaller than in Arecibo message, which might mean that the aliens live below the corona, perhaps at the magnetic flux tubes of the convective zone carrying magnetic fields of order 2 Tesla for which electronic cyclotron radiation is at micro-wave range. One should not forget the spectroscopic evidence for water at solar spots [E2] and for solid calcium-ferrite surface at photosphere [E8] having interpretation in terms of dark  $N$ -matter. Notice also the fact both calcium and iron ions are fundamental for the terrestrial life.

The question is where in the Earth's magnetosphere (with dark flux sheets included) the biological bodies of aliens could be hiding (magnetic bodies of aliens could differ from those of ours in any essential manner). The Freudian answer is that since they are not visible they must lurk in the cellar, that is underground. One can indeed build a vision about alien life based on this idea and consistent with the hints provided by the crop formations.

### ... or futuro-terrestrials?

If the crop circles are generated by communications involving negative energy photons (phase conjugate light) as the model for the realization of intentional actions indeed implies, then the signals responsible for the formation of crop circles arrive from the geometric future. In this case the civilization could be arbitrary far away from Earth and the temporal distance would determine the dark matter level to which it corresponds (in particular, the span of its long term memories). Chilbolton message however leaves only the possibility that the civilization is some other civilization or ourselves of the geometric future after the colonization of Mars and Jupiter.

This civilization must have invented the technology making it possible to apply time mirror mechanism (see **Fig.** <http://tgdtheory.fi/appfigures/timemirror.jpg> or **Fig.** ?? in the appendix of this book) to induce magnetic self-organization patterns leading to the generation of plasmoids serving as mediums for telepathic communications and able to perform simple tasks like construction of crop circles. The smaller size of Sun could indeed mean smaller size of Sun: standard model predicts that the radius increases very slowly so that this interpretation seems to be wrong in standard physics context.

Notice that the idea about intra-planetary life need not be in conflict with the idea that Crabwood and Chilbolton messages come from a distant geometric future. Indeed, intra-terrestrial life, possibly as some variant more primitive than terrestrial life, is supported by the TGD inspired model for pre-biotic evolution [K33, K34].

### The basic options for the interpretation of Chilbolton and Crabwood messages

One can imagine several options depending on what interpretation of Chilbolton and Crabwood messages one adopts.

1. The minimal assumption is that only plasmoid like life forms survive at the high temperatures of the Earth and planetary interiors. In this case the three codes could be assigned with the life forms assignable to Sun, Mars, and Jupiter. These three codes could also correspond to those of futuro-solars, -martians, and -jovians).
2. Inherently dark bio-molecules and  $N$ -molecules could make possible also life at hot temperatures of Earth's interior. This option will be discussed in the sequel. Even in the case that IT life forms with genetic code are possible, the simplest assumption is that their genetic codes are same as those of ordinary terrestrials so that three codes would result as suggested by the Crabwood message.

## 8.3.2 Two Guesses For The Temporal Distance OfFuturo-Terrestrials

In the following two guesses for the temporal distance of futuro-terrestrials are discussed.

### First guess

There are highly controversial claims that Sun is shrinking with the rate of 1 per cent per century [E5]:  $d\log(R)/dt = 10^{-3}/\tau$ ,  $\tau = 100$  years. The analysis of [E10] however led to a conclusion that only oscillations with a period of 76 years are in question. If the shrinking occurred for the entire Sun rather than only surface layers, the claimed rate for shrinking would mean that gravitational energy would be liberated with a rate  $P = GM_{Sun}^2/R \times d\log(R)/dt$ , which would give  $P \sim 10^{29}$  Watts, which is much higher than the power  $P \sim 4 \times 10^{26}$  Watts radiated by Sun by known mechanisms. The presence of the classical  $Z^0$  force could make possible considerable deviations from the standard stellar evolution and might be also needed to explain the oscillations of the solar radius. The increase of the gravitational binding energy could be compensated by the increase of the repulsive  $Z^0$  Coulomb energy so that the catastrophic conclusion could be avoided. One could say that gravitational and  $Z^0$  force serve opposite tendencies compensating each other in the "solar homeostasis".

If the shrinking were real and would continue with the rate claimed in [E5], one would have  $R/R_{now} = \exp(-10^{-3}t/\tau)$ . If the radius in Chilbolton message is by a factor  $k < 1$  smaller than in Arecibo message, the proposed interpretation implies that the message must have been

sent from at temporal distance  $t \simeq \log(1/k) \times 10^3 \tau \sim 10^5$  years in the geometric future. A more realistic estimate would probably increase the value of  $t$  by some powers of 10. If this extremely light hearted argument were taken seriously, a breakthrough in time mirror technology is not to be expected during my lifetime!

In the model for a fractal hierarchy of EEGs predicting correctly the band structure and narrow resonance bands of ordinary EEG the characteristic time scale of life forms at  $k$ : th level of hierarchy corresponds to the Josephson period of the Josephson junction defined by the scaled up version of cell membrane and scales as  $r$ .  $k = 7$  level of dark matter hierarchy corresponds to a time scale of  $\sim 50$  years. The ability to communicate with geometric past in a time scale of  $10^5$  years, which corresponds to the next  $k = 8$  level of the dark matter hierarchy, means that this is also the characteristic time scale for the long term memories of futuro-terrestrials.

### Second guess

One can imagine also a second manner to guess the temporal distance of futuro-terrestrials. Rather curiously, Crabwood formation appeared year and one day later than Chilbolton formation. A possible interpretation is as a message telling that the it takes one day more for Earth to rotate around Sun in the geometric future so that year is by one day longer.

The mass loss of Sun causes the gradual weakening of the gravitational force of Sun causing the increase of the radii of planetary orbits and thus also of orbital periods. The rate for the increase of the orbital period is  $d\log(T)/dt \equiv 1/\tau = -1/4 \times d\log(M_{Sun})/dt$ . The rate of the solar mass loss is believed to be mostly due to the energy liberated in fusion, and one has in a good approximation  $d\log(M)/dt = 10^{-13}/year$ . This gives  $T(t)/T(now) = \exp(t/\tau)$ . The lengthening of year by one day requires a time  $t \simeq \tau/365 \sim 10^{11}$  years, which is about one percent of the rough estimate for the lifetime of Sun, and of the same order of magnitude as the estimates for the time parameter called the recent age of the Universe. In fact, Sun is estimated to become a red giant within 7.5 billion years making life as we understand it impossible at Earth.

This would mean that futuro-terrestrials would correspond to  $k = 10$  level of dark matter hierarchy which almost cosmological time span of long term memories.

This estimate is based on the neglect of perturbations caused by planets to each other's orbits. The multiple gravitational resonances between planets resulting, when the ratios of rotation or precession periods are integer valued, are a route to chaos (in the sense of complexity rather than randomness) in the planetary system. Since also  $Z^0$  force is  $1/r^2$  force, this hold true also when classical  $Z^0$  force is taken into account. These resonances can affect dramatically orbital parameters. Numerical simulations lead to the conclusion that the Lyapunov time of planetary system is 5-10 million years [E9]. If this holds true also in TGD Universe, then the parameter  $t$  for the future civilization for which year is one day longer than for us, could be as small as million years and of same order of magnitude as the first estimate giving  $k = 8$  for the level of dark matter hierarchy characterizing futuro-terrestrials.

### 8.3.3 Conditions On High- $T$ Life

In the following some conditions on life at high temperatures are discussed on basis of the general vision about magnetic bodies as controllers of biological bodies discussed in the first part of the chapter [K27].

#### Inherently dark atoms might allow the survival of chemical life at high temperatures

The model for crop formations was developed few years before the emergence of dark matter hierarchy and involved the notion of intra-terrestrial life.

Certainly the high- $T$  life in form of plasmoids could exist but if one interprets Chilbolton and Crabwood messages as information about IT life or high- $T$  life in Sun, Mars, and Jupiter, also chemical life should be possible and should resemble ours to a high degree.

##### 1. First option

The only way out in the framework of the ordinary quantum mechanics is that the space-time sheets are virtually thermally isolated so that even in the interior of Earth space-time sheets

with room temperature are possible. Also space-time sheets for which ELF frequencies correspond to energies above thermal threshold must be present to explain the correlation of EEG with consciousness. A further hypothesis was that the typical size of the space-time sheet corresponds to the de Broglie thermal wavelength  $\lambda_{dB}(\hbar, T) = \sqrt{3\hbar/\sqrt{2mT}}$  for the typical particles involved. This would allow room temperature space-time sheets also in harsh environments like the interior of Earth. If thermal isolation fails then situation changes and space-time sheets with size larger than  $\lambda_{dB}(\hbar, T)$  are not possible.

### 2. Second option

The discovery of dark matter hierarchy allows to give up the hypothesis about thermal isolation. If inherently dark atoms as  $r$ -fold  $M^4$ -coverings of ordinary atoms and having essentially same energy spectrum are possible at  $k^{\text{th}}$  level of dark matter hierarchy ( $\hbar(k) = r\hbar_0$ ), then also  $N$ -atoms and  $N$ -molecules become possible as discussed in the first part of this chapter [K27]. Note that the formula for  $\lambda_{dB}(\hbar, T)$  generalizes and predicts a dark hierarchy of thermal de-Broglie wavelengths.

There is also an additional constraint on the temperature. Quantum criticality plays a key role in TGD inspired quantum biology and since the energies of photons resulting in the transitions of  $N$ -particles are scaled up by  $N$ , one might argue that also the critical temperature at which intelligent life is possible (about 36-37 °C for ordinary life and understandable in terms of high  $T_c$  superconductivity [K14, K15]) is simply scaled up by  $N$  in the first approximation. Certainly  $N$ -water would be required as well as  $N$ -DNA and  $N$ -amino-acids plus other biologically relevant  $N$ -molecules satisfying  $N > T/T_{\text{room}}$ . These molecules could perhaps give rise to a dark variant of ordinary life surviving at temperatures encountered in the Earth's interior.

Also ordinary life could involve  $N$ -DNA and  $N$ -amino-acids but in the interior of Earth the range of thermally stable values of  $N$  would be narrower unless the value of  $r$  is higher. The model for the replication of DNA and lock and key mechanism of bio-catalysis suggests that dark  $N$ -hydrogen atoms are most probably associated with hydrogen bonds.

### How the integers characterizing $N$ -bio-molecules in the Earth's interior should depend on the temperature?

Ordinary life is possible only in a very narrow temperature range around 37 K and as explained quantum criticality explains this [K14, K15]. Dark matter inspired option for high- $T$  life is based on replacement of Earthly bio-molecules with their  $N$ -variants with larger  $N$  so that one would have  $N$ -H<sub>2</sub>O,  $N$ -DNA,  $N$ -proteins, etc. with  $N/N_{\text{room}} > T/T_{\text{room}}$ .

The critical temperature  $T_c$  around which life is possible would be scaled up to  $T_c \rightarrow NT_c$  and the minimal value of  $N$  as a function of temperature would be given by  $N_0 = [T/T_{\text{room}}]_+$ , where  $[x]_+$  is the smallest integer larger than  $x$ . In particular, this formula would determine the dependence of  $N_0$  as a function of depth as one goes to interior of Earth. The space-time sheets of  $N$ -atoms would be  $r \geq N$ -fold coverings of ordinary space-time sheets.

$T$  increases by an order of magnitude from  $T_0 = 300$  K to  $T = 1300$  K at crust-mantle boundary to  $T = 4000$  K at the mantle-core boundary, and to  $T = 4600$  K at core-inner core boundary. This means that also  $N$  does so that one would have  $N/N_{\text{room}} = 40/3 \sim 13$  at the mantle-core boundary and  $N/N_{\text{room}} \sim 15$  at core-inner core boundary. In principle, even temperatures up to  $T = r/N_{\text{room}} \times 300$  K would be possible.

There is evidence for solid structures in the mantle-core boundary [F20] where most solids are thermally unstable. Due to the high pressure the interpretations in terms of standard physics are of course possible but one can also ask whether this evidence could be seen as evidence for dark matter structures consisting of  $N$ -molecules with  $N > T/T_c$ , where  $T_c$  is the melting temperature of ordinary molecule.

### Conditions from the thermal stability of the analog of EEG

The analogs of EEG and its scaled up variants are in a fundamental role in the control of biological body by magnetic body and this should hold true also for ITs. According to the model of EEG resulting as a special case of the model for the fractal hierarchy of EEGs and its generalizations [K30], the analog of EEG involves two components.

### 1. Cyclotron component

The first component corresponds to the harmonics of cyclotron frequencies of biologically important ions: many of them belong to the alpha band in the case of ordinary ions.

Since 10 Hz corresponds to a secondary p-adic time scale assignable to electron defining an inherent time scale of elementary particle in zero energy ontology, one can ask whether this frequency means breakdown of the fractality hypothesis and raises the frequency scale of ordinary EEG in special role. One can also wonder whether 10 Hz frequency could define a universal biorhythm.

Dark ions reside at magnetic flux sheets traversing DNA and cyclotron radiation affects directly DNA. Cyclotron frequencies are associated with motor control affecting directly DNA and inducing gene expression among other things. The models leads naturally to the introduction of the notions of super genome and hyper genome [K30].

### 2. Josephson junction component

Josephson junctions assumed to be associated with cell membrane define second contribution to EEG as frequencies associated with coherent state of photons emitted by Josephson current. This component is present only if Josephson junctions, naturally assignable with a membrane like structure separating the plasmoid from environment, are present.

The frequencies are expressible as  $f_{n,\pm} = n f_c \pm f_J$  and in the case of ordinary EEG alpha band and its harmonics split into counterparts of beta and theta band. alpha band has scaled variant also in more general case and corresponds to ions which define alpha band for ordinary ions.

1. The essential condition is that cyclotron energy scale is above the thermal energy  $E_{th} = 2.88T$  ( $k_B = 1$  in the units used). This fixes the minimal value of the integer  $k_d$  characterizing the level of dark matter hierarchy involved. Note that the hypothesis is  $h_{eff} = nh$ , where  $n$  is product of distinct Fermat primes and power  $2^{k_d}$ . For ordinary EEG frequency of order 1 Hz the minimal value of  $k_d$  is roughly  $k_d = 44$ . DNA cyclotron frequencies assuming that the charge of DNA is solely due to the phosphate groups  $PO_4^{2-}$  are around 1 Hz and just above the thermal threshold.
2. Second condition is that Josephson energy determined by the membrane voltage defines Josephson energy which is above thermal energy. This gives  $Q_{em} eV \geq 2.88T$  for far from vacuum extremals. For almost vacuum extremals the classical  $Z^0$  field proportional to the classical em field contributes to the coupling and one must replace the charge  $Q_{em}$  of charge carrier with effect em charge  $Q_{eff}$  [K30]: this increases the scale of Josephson energies roughly by a factor 10. For far from vacuum extremals Josephson energies are near thermal energies whereas for almost vacuum extremals they are in visible and UV region, and one can identify bio-photons and EEG photons as decay products of dark Josephson photons.
3. Superconductivity prevails only below some critical temperature whereas vacuum extremal property is expected to be possible only above some critical temperature. This suggests that cell membrane functions properly only in a narrow temperature range. The range 36-37 C is suggested by the fact that the effects of ELF em fields on vertebrate brain are observed only in this range.

Josephson frequency  $f_J$  is inversely proportional to  $\hbar$  and would scale in the case of EEG would scale as

$$f_J = \frac{T}{T_{room}} \times f_{J,room} ,$$

where  $f_{J,room} \simeq 5$  Hz holds true. alpha band and its harmonics and also the widths of theta and beta bands would scale like  $B$ . The positions of theta and beta bands would scale like temperature, and one would have the formula

$$f_{n,\pm} = \frac{B}{B_E} n f_c \pm \frac{T}{T_{room}} f_J$$

for the frequencies in the generalized beta and theta bands, when  $k_d = 44$  holds true also in the high- $T$  environment.

It is illustrative to consider some examples.

1. *Mantle-core boundary*

The temperature is  $T = 4000 \text{ K} \sim 13T_{room}$  at the mantle-core boundary. This temperature allows simple ordinary molecules like carbon monoxide and water (due to the high pressure). Thermal energy is still eV and below Josephson energy and super-conductivity is possible only if cyclotron energies are high enough. For 5 Hz cyclotron frequency  $r = 47$  gives energy of order eV. One could thus consider the possibility that both the super-conductivity and criticality could be possible in scaled up temperature range.

2. *Sunspots*

The average temperature of the solar photosphere is about 5800 K whereas the minimum temperature is  $T_{min} = 4000 \text{ K}$  and same as the temperature at mantle-core boundary. Inside sunspots the temperature varies in the range 3000-4800 K and sunspots, which are analogous to tornadoes, would be good candidates for the seats of solar life forms. Spectral analysis demonstrates the presence of water inside sunspots [E2]. There is also evidence for a solid calcium ferrite surface at photosphere [E8].

The value of the sunspot magnetic field is between 1600-2500 Gauss and thus cyclotron frequency is about 3200 – 5000 times higher than at the surface of Earth. Also in this case  $k_d = 44$  level would correspond to thermally stable “EEG” photons with frequencies in the range of ordinary EEG.

### De-Broglie temperature and the p-adic length scale of the space-time sheet

A rough estimate for the typical size of the space-time sheet for a system consisting of  $N$ -particles of mass  $m = Am_p$ ,  $A$  mass number, at temperature  $T$  is obtained as the thermal de Broglie wave length  $\lambda = \sqrt{3}\hbar_0/\sqrt{2Am_pT}$ . Note that the estimate does not depend on  $N$  or  $\hbar(k)$  for inherently dark atoms and is same as for ordinary atoms. This follows from the  $r$ -covering property alone of  $N$ -particles.

1. The hypothesis about the thermal de-Broglie wave length as a typical size of a stable space-time sheet would suggest that the ordinary hot matter (liquid quartz or iron) resides at the  $k = 131$  space-time sheets.
2. For water with  $A = A_w = 18$  at room temperature  $T = 330 \text{ K}$  one has  $\lambda \simeq .7$  Angstroms so that  $k = 137$  is a reasonable identification for the p-adic prime characterizing the atomic space-time sheet in this case (note however that  $L(137) = .78$  Angstroms is slightly above  $\lambda$ ).

The p-adic length scale associated with  $\lambda$  changes at certain critical temperatures  $T$  coming as powers of 2 using a suitable unit and characteristic for a given atom. The critical values of temperature could define physically detectable boundary layers. The p-adic length scale  $L(\lambda)$  is predicted to decrease by a factor of order  $x = \sqrt{A_w/A} \times \sqrt{T_0/T}$ . This factor should be near to the ratio  $L(131)/L(137) = 1/8$  at the layer where  $k = 131 \rightarrow k = 137$  transition occurs. For  $A(Si) = 32$  resp.  $A(Fe) = 56$   $k = 137 \rightarrow 131$  transition should occur at  $T = 1524 \text{ K}$  below crust resp.  $T = 871 \text{ K}$  inside crust.

The presence of  $k = 131$  space-time sheets at the mantle-core boundary (and inside sunspots) would add to the metabolic repertoire strong metabolic energy quanta corresponding to the dropping of protons and electrons to larger space-time sheets from  $k = 131$  space-time sheets. The quanta would be about 32 eV for protons and 64 keV for electrons. The hot environment would be an ideal provider of metabolic energy for high- $T$  life-forms.

In many-sheeted space-time particles topologically condense at all space-time sheets having projection to given region of space-time so that this option makes sense only near the boundaries of space-time sheet of a given system. Also p-adic phase transition increasing the size of the space-time sheet could take place and the liberated energy would correspond to the reduction of zero point kinetic energy. Particles could be transferred from a portion of magnetic flux tube portion

to another one with different value of magnetic field and possibly also of Planck constant  $h_{eff}$  so that cyclotron energy would be liberated. In the following only the “dropping” option is discussed.

### 8.3.4 What IT Life Could Look Like?

Taking into account the almost identical properties of  $N$ -atoms and ordinary atoms, it might be better to transform the question “What IT life could look like?” can be replaced by “How IT life differs from the life in biosphere?”.

#### Some arguments supporting IT life

The following arguments favor IT hypothesis.

1. Boundary layers are ideal places for self-organization since they contain gradients which give rise to energy currents feeding self-organization. Liquid state is certainly crucial for life since this makes it possible quantum control the atomic space-time sheets very effectively. Ordinary life relies actually on the liquid crystal property of water which suggests that the same is case quite generally. Thus those parts of the planetary core which correspond to boundary regions between solid and liquid phases, should be ideal places for IT life forms to flourish, and it is actually difficult to imagine any other state of matter making possible life able to control the surrounding world effectively. This picture is consistent with and would realize concretely the general vision about magnetosphere as a living system. In Earth’s interior the mantle-core and core-inner core boundaries are especially interesting in this respect since these boundaries represent solid liquid boundaries. Recall also that  $N$ -DNA and  $N$ -amino-acids would be possible for  $N > T/T_{room}$  by the previous argument.
2. According to the Chilbolton message, also silicon is an element involved with the alien DNA. Magnetized iron and  $SiO_2$  (glass, quartz) balls of radius about 10-30 micro-meters are found from crop circles, and these elements must have been solidified from molten state in situ. The additional message of molten state for quartz and iron, besides providing information about plasmoids themselves, could be that it is planetary interiors, where the biological bodies of the life-forms responsible for the crop circles reside. Molten glass would be associated with the mantle-core boundary and molten iron with the core-inner core boundary. The small size of Sun could thus also mean that these life-forms receive much less solar radiation than us.
3. A further possibly important aspect is the transparency of the liquid state implying that visible light propagates over long distances without absorption. This might be absolutely essential for the possibility of visible photons to propagate through sufficiently long distances. For dark photons situation changes, and the transparency of liquid glass might be due the fact that some fraction of photons propagate as dark photons through it. Hence quartz is transparent in liquid state, and thus an optimal candidate for a medium whose behavior is quantum controlled from larger space-time sheets.

#### Structure of the Earth’s interior and IT life

Combining the above described general ideas with the knowledge about Earth interior, one ends up with a more detailed picture.

1. Earth’s interior decomposes into a relatively thin crust of thickness 30-60 km; a plastic mantle consisting mainly of Si, O, Mg, Fe, and Al mostly in form of silicates  $FeO-SiO_2$  and  $MgO-SiO_2$ ; a liquid core containing mainly Fe and S; and the inner core consisting mainly of solid Fe. There are thus two solid-liquid boundary regions. The upper boundary region could contain at least glass in liquid crystal form and the lower boundary region Fe in liquid crystal form. Remarkably, it is just glass and Fe solidified in situ, which are found from crop circles, and Crabwood message indeed contains two different genetic codes. Also silicon-based crystal structures not encountered in Nature are found from crop formations: the interpretation as artefacts suggests itself. The richer chemical structure of the mantle is consistent with the hypothesis that the glassy life is based on 80 DNA-23 amino-acid code whereas iron-men correspond to 64 DNA- 20 amino-acid code.

2. Theoretically, the thickness for the mantle-core layer is expected to be of order few meters. The reflection of tectonic waves from mantle-core boundary has given evidence for a rich structure at this boundary and suggests that this expectation is not quite correct [F20]. Structures of thickness about 150 meters and with of several kilometers and between liquid and solid state have been identified at the top of the liquid core. One explanation is that lighter elements in the core-inner core boundary saturate and condense to solid form and being lighter than iron, raise up and form kind of puddles at the highest points of core.

A more radical explanation is that these structures are artefacts built by ITs possibly consisting of thermally stable  $N$ -atoms and -molecules. In the mantle-core layer the velocity of tectonic waves gets ultra-low. The velocity of sound in solid phase is quite generally higher than in liquid phase: this reflects directly the fact that the approximately harmonic forces between atoms are stronger. If liquid crystal phase is present the velocity in transversal liquid directions should be low. What is fascinating that sooner or later the analysis of reflected tectonic waves could give detailed information about mantle-core boundary.

3. Quite recently it has been announced that Earth contains a previously unidentified core region with size of 300 km [F6]. Assuming that the magnetic field behaves like a dipole field down to the distances of order 300 km, the electronic cyclotron frequency at this distance is 5 GHz which corresponds to the wave length of about 6 cm, the size scale of BOLs. If the magnetization density below this distance is constant (so that the core would be like ordinary magnet), the magnetic field would be constant below this length scale.

Also some other experimental findings support this picture. It has been found that the times for of the compressional waves to travel through Earth in magnetic north-south direction and equatorial direction differ by 2-3 seconds [F16]. This suggests a gigantic crystal structure with symmetry axis parallel to magnetic field. If the join along boundaries condensate associated with atomic space-time sheets is hollow with a hole of radius 300 km, and if only  $k = 151$  space-time sheet consisting of cold and magnetized iron is at this space-time sheet one can understand the crystal structure and how Earth's magnetic field results by magnetization. The estimated velocity of propagation for compressional waves in the crystal is about 3 km/s which is rather near to the 5 km/s for steel at room temperature. The appearance of a relatively small hole at the atomic space-time sheet is not so surprising since typically the field equations of TGD imply hole like singularities at given space-time sheet, and the hole could be analogous to black hole like singularity carrying inertial and gravitational masses at its boundary.

The simplest hypothesis is that the magnetic field associated with the plasmoids is the Earth's magnetic field or its dark variant in the core region of Earth. This would mean that some kind of life forms could reside also at the boundary layer associated with the new core. If the  $k = 151$  space-time sheet is not ferromagnet above the radius  $r = 300$  km, the boundary region could be in spin glass type magnetic phase and the bio-control from magnetic flux tubes would operate on the local direction of magnetization of the magnetized regions in the boundary region. Crabwood message could contain also a third genetic code consisting say 5+1+1+1 special symbols alone and coding 16 DNA doublets to 8 amino-acid. This simpler life-form might reside at the most inner boundary and be associated with the plasmoid like life forms.

### What could the EEG and sensory representations of ITs look like?

If the sensory representations of IT life-forms are realized at the personal magnetic canvas and at magnetosphere in the same manner as ours, the cyclotron transitions at the distance of about

$$r_1(A) = (A/A_1)^{1/3} \times r_0 ,$$

giving

$$y(A, A_1) = (A/A_1)^{1/3} \times x .$$

Here  $r_0 = xR$  is the radius associated with the life-form, and  $r_1 = yR$  is the distance at which the sensory representation is realized.  $R$  denotes the radius of Earth and  $A$  the mass of the ion at  $r_0$  associated with IT cyclotron transition and  $A_1$  the mass of the ion at  $r_1$  defining the cyclotron transitions associated with the sensory representation.

If the most important frequencies of alien EEG correspond to cyclotron frequencies, if aliens live at the mantle-core and core-inner core boundaries, and if the magnetic field inside Earth behaves as dipole field in a reasonable approximation, one can deduce the EEG frequency range of aliens by scaling the human frequency range by the ratio

$$x^{-3} = \left(\frac{R}{r}\right)^3 = \left[\frac{f_S(r)}{f_S(R)}\right]^3 ,$$

where  $r$  is the distance of the boundary region from the center of the Earth. The constraint that representation is realized in inner magnetosphere gives the bound  $y \leq 6$  and the constraint that it is realized in ionosphere gives  $y \simeq 1$ .

### 1. Biosphere

In this case the basic equation is obtained by putting  $x = 1$  in the general equation so that one has

$$y = \left(\frac{A}{A_1}\right)^{1/3} .$$

For protonic representations with  $A_1 = 1$  possible in entire inner magnetosphere the constraint  $y \leq 6$  allows all possible values of  $A$ .

### 2. Mantle-core boundary

For mantle-core boundary the ratio is roughly  $x^{-3} = 7.1$  so that the EEG frequency range 1.5 – 90 Hz scales up to 107 – 639 Hz. Sensory representations can in this case be realized as ionic transitions in atmosphere. The basic equation is

$$y = \left(\frac{A}{A_1}\right)^{1/3} x ,$$

where  $A$  is the mass number of the ion in mantle-core boundary and  $A_1$  is the mass number of representative ion. For protonic representation one has

$$y = 1.92A^{1/3} .$$

The condition  $y \leq 6$  guarantees that representation is realized in the inner magnetosphere and gives  $A \leq 27$ . This corresponds in ordinary EEG to frequencies  $f \geq 11$  Hz. For  $A_1 > 1$  also scaled up variants of alpha and theta frequencies are representable: note however that the densities of these ions are probably much smaller than in ionosphere.

One can consider also ionospheric ion representations satisfying  $y \simeq 1$  for mantle-core boundary. Now the mass numbers of the ions involved are related by

$$\frac{A}{A_1} \simeq x^{-3} \simeq 7.1 .$$

The biologically most interesting ions have  $A > 7$  and are representable. One manner to realize this sensory representation is using cells or brains of various organisms and one might consider the possibility that we actually are life-forms which have developed as magnetospheric sensory representations of the life-forms at the mantle-core boundary.

### 3. Core-inner core boundary

For core-inner core boundary the ratio is roughly  $x^{-3} = 263$  for  $f_S(r) = 50$  Hz and  $x^{-3} = 135$  for  $f_S(r) = 40$  Hz. In this case only electronic sensory representations are possible and one has

$$y = \left(\frac{Am_p}{m_e}\right)^{1/3} x ,$$

1. For  $x^{-3} = 263$  this gives

$$y \simeq 1.98 \times A^{1/3} .$$

The range  $[1, 6]$  for  $y$  corresponds to the inner magnetosphere and the upper bound  $A \leq 27$  and to scaled up variants of cyclotron frequencies above 11 Hz in ordinary EEG. Only beta and gamma bands would be represented.

2. For  $x^{-3} = 135$

$$y \simeq 2.48 \times A^{1/3}$$

The upper bound for  $A$  is  $A \leq 14$  and to the scaled up variants of cyclotron frequencies above  $\sim 20$  Hz in ordinary EEG.

#### 4. Inner core-most inner core boundary

The boundary of the most inner core of radius 300 km could also be carrier of life-forms, perhaps plasmoid like life-forms. The simplest hypothesis is that the magnetic field associated with the plasmoids is the Earth's magnetic field in the core region of Earth, which would be constant and of order .2 Tesla below this distance if dipole approximation makes sense.

If important EEG frequencies correspond to cyclotron frequencies, part of the EEG would be scaled up by a factor  $2^{169-157} = 2^{12} \simeq 4000$  so that EEG frequency range .25 – 90 Hz would be mapped to 1 – 360 kHz. Ionic cyclotron frequencies would be in the MHz range with proton cyclotron frequency equal to 1.2 MHz. The cavity resonance frequency analogous to the lowest Schumann frequency for a structure with radius 300 km is 159 Hz.

If the sensory representations of IT life-forms possibly existing at at  $r_0 = 300$  kilometers are realized as electronic cyclotron transitions one has

$$y \simeq .59 \times A^{1/3} .$$

Ions with  $A \geq 6$  would be represented above Earth's surface. All ionic representations would be realized in Earth's interior.

#### What are the metabolic energy quanta of ITs?

ITs would share with us the basic quanta of metabolic energy which are .5 eV *resp.* 1 keV corresponding to the dropping of proton *resp.* electron from  $k=137$  space-time sheet to the magnetic flux tube of the Earth's magnetic field.

If  $k = 131$  corresponds to the hot space-time sheets at which liquid iron and quartz reside, the dropping of proton from the hot  $k = 131$  space-time sheet would correspond to a much higher energy of about 32 eV able to ionize hydrogen atom. For electron the corresponding energy would be 64 keV. 32 eV energy quantum might play a role in the intelligent control of the hot iron or quartz from larger space-time sheets. Even some kind of liquid iron or quartz metabolism could be imagined.

Also heavier atomic nuclei can drop to larger space-time sheets from  $k = 131$  space-time sheet. The zero point kinetic energy for a particle of mass number  $A$  at  $k = 131$  space-time sheet is obtained from proton's zero point kinetic energy  $E_p(137) \simeq .5$  eV by scaling  $E_A(131) = 2^6 * E_p(137) \simeq 32/A$  eV. For mass numbers  $A = 12, 14, 16, 32$  associated with  $N, C, O$  and  $Si$  which, according to Chilbolton message, appear in the DNA of aliens, this gives energies 2.7, 2.3, 2.0, 1.0 eV. These energies cover the wave length range for visible light. Obviously the dropping of ions from  $k = 131$  space-time sheet to larger space-time sheets could explain the visible light generated by plasmoids and the generation of light at these frequencies might provide a possibility to get a contact with plasmoids. These energies would be in exactly the same role as the proton's zero point kinetic energy in the ordinary metabolism, which suggests that IT and also plasmoid metabolism involves also the energies besides those associated with our metabolism. Entire fractal hierarchy of energy currencies would be thus involved. If the sizes of  $k = 131$  space-time sheets can vary so that the spectrum becomes effectively continuous, one can even consider the possibility that bio-photons are generated by the dropping of atoms from  $k = 131$  space-time sheets. The question is whether the propagation of a plasmoid like excitation at a temperature of order 3700 K along DNA double strand could generate bio-photons.

Dark micro-waves amplified by quartz crystals might be crucial for the metabolism of plasmod life-forms and replace visible light serving as the “food” of the terrestrial life forms. Tectonic activity might be as important for these life-forms as solar radiation is for us. The crust and mantle could serve as amplifiers of em waves in a wide wave length range and make possible communications between IT and us.

### 8.3.5 Where Did Those 223 Genes Pop Up?

The reports of the Public Consortium about human genome in Nature, Feb 15, 2001 [I14] and of Celera Genomics in Science of Feb 16th, 2001, [I27] contained two big surprises.

#### Are we really so near to fruit flies?

The first astonishing discovery was that the amount of human genome differs relatively little from those of lower organisms: we have only about 30, 000 genes, little more than twice the number 13, 601 of genes for fruit fly. This paradoxical finding forces to think that our genome is not solely responsible for what we are and that the intronic portion of DNA (only about 1 per cent codes of human DNA codes or amino-acid sequences), is not “junk DNA”, but contains important biological information and expresses it non-chemically.

In TGD Universe introns would express memes as the classical field patterns associated with MEs (“topological light rays”) responsible for the basic expressions of language understood in an extremely general sense. This language includes body language and even cellular signalling, and could quite well make possible (not necessarily conscious) interspecies communications based on memes expressed by communicating species and forming a common vocabulary. All eukaryotes (cells with nuclei), even bacteria, would possess part of the vocabulary of this universal language. The memetic code word is predicted to consist of a sequence of 21 DNA triplets and carries 126 bits of information instead of 6 bits of genetic code. Of course, also genes are expressed in terms of MEs and define a lower level language.

In this framework the actual role of DNA can be understood using the computer analogy. Memes represent the program modules written using the programming language defined by the memetic code, and realized in terms of the field patterns associated with MEs. Genes represent the necessary hardware needed to realize these programs. System builds only the hardware needed, that is cell expresses only part of the genome. DNA engineering requires besides the addition of the new programs (memes, introns) also the insertion of the necessary hardware (new genes). Memes and corresponding genes should have very intimate relationship. In this conceptual framework the standard view is wrong since it identifies the build-up of a new hardware as the sole activity at the DNA level. This would be like identifying the addition of a net card to a computer as the fundamental activity related with computers.

#### The head-scratching discovery

The “head-scratching discovery” by the public consortium, as Science termed it, came when the genome was compared with the genomes of our predecessors. It was found that human genome contains 223 genes not possessed by invertebrates. Contrary to what one might expect, these 223 genes could make an enormous difference. The reason is that this number is more than two thirds of the number of the 300 genes differentiating between humans and chimpanzees so that these genes could be the main determinant of the dramatic difference between humans and chimpanzees in standard genetics.

Of course, in TGD framework the most important differences would probably relate to the intronic portion of the DNA responsible for language. Dramatic differences between our intronic DNA that of our invertebrate and perhaps even vertebrate predecessors, in sharp conflict with the idea of continuous evolution, should be discovered.

#### Are the enigmatic genes a horizontal gene transfer from bacteria?

Biologists can explain the presence of the enigmatic genes only by a “rather recent horizontal transfer from bacteria”. Here “rather recent” refers to the evolutionary time scale.

This explanation can be challenged on various grounds.

1. The simplest working hypothesis is that the transfer from bacteria is a probabilistic process. The problem is however why the horizontal transfer did not occur to the genomes of other vertebrates and invertebrates and gradually through the whole evolution. One could argue that something characteristic to the vertebrate genome should have made this process possible. In TGD framework one could imagine that the intronic portion of the vertebrate genome could have contained something which made the transfer possible: a common part of memome with the bacteria involved and making possible language based communications (“language” understood in a generalized sense) at DNA level perhaps?
2. The enigmatic genes are involved with important physiological functions. In particular, they are responsible for important neurological enzymes which stem from mitochondria having its own genome. According to my non-professional interpretation this statement means that also mitochondrial genome contains these enigmatic genes. Thus both mitochondrial and nuclear genomes would have been altered by this horizontal transfer from bacteria. Simultaneous double horizontal transfer does not however look a probable event.
3. Only 113 of the 223 enigmatic genes are widespread in bacteria: it would be easier to believe in the horizontal transfer if all of them were widespread. These 113 widely occurring genes are not encountered in invertebrates at all. As a matter fact, this finding suggests that the transfer occurred from the vertebrate genome to the bacterial one and only partially, rather than vice versa. The analysis of proteins expressed by the enigmatic genes demonstrated that out of 35 identified, only 10 had counterparts in other vertebrates. 25 of them were unique to humans. This suggests that a considerable part of the horizontal transfer has occurred relatively recently and together with associated introns might even distinguish us from chimpanzees.

#### **Horizontal transfer as DNA engineering?**

The objections against the horizontal transfer from bacteria force to consider seriously the possibility that the horizontal transfer represents an intentional DNA engineering, both memetic and genetic. The most important transfer should have been to the intronic part of the DNA. The addition of memes would be like adding a new program to a computer. The addition of genes would be like adding a new hardware (say net card or data cable) required by the program to run. The comparison of the intronic portions of DNA of humans and lower vertebrates might thus lead to further “head-scratching” discoveries. The data are consistent with the assumption that genetic/memetic engineering activities have occurred in several steps during the evolution of the vertebrates although a considerable portion of the enigmatic genes and associated introns, perhaps even two thirds, have been “injected as a single dose”.

The evolution of the hominides in Africa had a stagnation period of about 1.5 million years as demonstrated by the study of the ancient stone tools. Then, for about 50 thousand years ago, a sudden jump to creativity occurred. The first ornaments appeared meaning that hominides had become artists and started to express their position in the social hierarchy by clothing and ornaments. This signals about development of highly refined social structures. A general belief is that also language began to develop rapidly and made possible a cumulation of knowledge. It seems that modern human was born and started to migrate from Africa to North. Could it be that memetic engineering induced this crucial step in evolution? Could it be that Neanderthals had to leave because they were not subject to this memetic engineering? Also the emergence of the first civilizations for about 10 thousand years ago might have involved memetic engineering. The ancient Sumerian myths about Gods who came from Heaven and made us their images might be memetic fossils reflecting what occurred.

#### **Who performed the (memetic and) genetic engineering?**

One can imagine two identifications for the ancient genetic/memetic engineers.

1. The guess that the engineers were extra-terrestrials (ETs) is supported by ancient myths. The Sumerian and Akkadian texts found inscribed on clay tablets, in which the role of the Elohim in Genesis is performed by the Anunnaki, tell about “Those Who From Heaven to

Earth Came”. According to Zecharia Sitchin these myths can be seen as narratives about genetic engineering by life-forms, which were technologically much more advanced. These myths would relate to the last step in the sequence of engineering activities.

2. The second guess, intra-terrestrials (ITs), is natural if one accepts the TGD based identification of the life-forms responsible for the art of crop formations as ITs. The term intra-planetary (IPs) is actually more appropriate: the Chilbolton crop formation, which obeyed the same format as the Arecibo message sent to the outer space and telling about our species, suggests that the life-forms responsible for the crop formations live in our own solar system and inhabit besides Earth also Mars and Jupiter. Taking the ancient mythologies seriously, IPs from Mars or Jupiter would be the most plausible candidates for the ancient memetic/genetic engineers.
3. The third guess, is that genetic engineering is due to a highly advanced civilization of a remote geometric future populating Earth, Mars, and Jupiter, and applying highly advanced technology based on time mirror mechanism and possibly utilizing simpler intra-terrestrial life forms, perhaps plasmoids, as their couriers. Abduction experiences might relate to genetic manipulations using plasmoids to do the hard job. In this case encounters with aliens would be based on sharing of mental images.
4. The fourth guess is that genetic engineering is self engineering. The work of Yu. Chen Kangeng gives evidence that the transfer of the genetic information by electromagnetic means is possible [J1]. According to [I18], where the method is summarized, the successful transfer of the genetic information from a donor bio-system to an acceptor system was achieved via high-frequency electromagnetic fields feed repeatedly through the optically-active donor bio-system and then delivered over a long period of time to the receiving bio-system in its early developmental stages. The hybrids created through the irradiation of eggs and seeds with such “genetically loaded” fields are claimed to show very specific mixed characteristics that were transferred to the next generation without need for further irradiation.

It would seem that the donor genome or parts of it are imprinted to the electromagnetic field pattern in the process and that this field pattern is able to modify the target genome.

Nothing precludes the possibility that genes/supergenes/hyper genes at some level of dark matter hierarchy can also code for genetic self engineering since these activities are after all very similar to other genetically coded bio-chemical activities. The computer analogy would be programs writing programs. The engineering genes would be activated by  $W$  MEs inducing plasma oscillation patterns. The claimed effects could be understood if the interaction with genetically imprinted electromagnetic field pattern activates genes inducing genetic self engineering yielding the genetic modifications consistent with the pattern represented by the em radiation.

Magnetic body would receive information about the desired outcome as electromagnetic field patterns emitted by other organisms, most naturally members of the same species. If these modifications are successful, the magnetic body is exposed to this information for long enough time to react and activate  $W$  MEs inducing the genetic program inducing the genetic program leading to the suggested genetic modification.

Hyper-genes integrating groups of organisms to larger wholes would be naturally involved with the mechanism. This mechanism would guarantee a rapid propagation of successful genetic modifications to the entire population and would be much more effective than the slowly occurring selection of random mutations. The possibly existing genes responsible for the genetic self engineering could be also introns and express themselves by activating nuclear RNA and process like reverse transcription.

A further quite recent mystery discussed in [K37] is that corals seem to possess genes responsible for higher level psychological functions in mammals [I22]: it is very difficult to understand this as an outcome of selective pressures combined with random mutations. The proposed mechanism might explain these genes as a result of genetic engineering.

During the early developmental stages the genome might be plastic enough to allow genetic self engineering. The genetic modification during this period also the most rational option since this gives the best guarantee that the modifications are transferred to the offspring.

### Is genetic/memetic engineering an ongoing process?

Irrespective of whether IPs are the active genetic engineers or only realized the intentions of the civilization of geometric future, the memetic/genetic engineering by ITs or even IPs from other planets might be an ongoing process. This is consistent with the idea that also other vertebrates than humans might have been a target of genetic/memetic engineering. The following arguments, which restate what has been already said elsewhere in this chapter, support this view.

1. The seeds from crop circle formations have been reported to have better germination and growth properties, and it has been proposed that this is due to genetic and/or memetic engineering.
2. There exists a rare form of RNA for which the role of RNA triplet as the code word is taken by RNA doublet. We have in our immune system so called interferon-RNAase L system against this RNA. Does this mean that we have been in contact with this form of RNA, or even life-forms for which this form of RNA carries genetic information? On the other hand, the model of the genetic code inspired by the Chilbolton and Crabwood crop formations and by the symmetries of the genetic code, leads to the conclusion that RNA triplets responsible for our genetic code have resulted in a fusion of RNA doublets and RNA singlets. If this is the case, the ability of immune system to produce RNAase L would be natural.
3. Some persons who have reported abduction experience remain ill with a chronic fatigue and their immune system has been reported to contain high levels of RNAase L, as if they had been in contact with an exotic life form.

A possible TGD inspired identification for the primitive life form with RNA consisting of sequences of exotic RNA doublets would be as a plasmoid, plasma ball, serving as an intelligent quantum medium making possible telepathic communication with IPs by the sharing of mental images. Telepathy might be the only reasonable means of communications since a direct physical contact between highly life forms and us would probably be a catastrophic event. The reason is that the immune system of both ours and of higher life forms would be powerless against invaders obeying different genetic code. The stories about intelligently behaving light balls are indeed the basic stuff of UFO reports. Balls of light have been reported to appear also around crop formations and their is even a report about ball of light caught in an act of constructing a crop formation.

### 8.3.6 Do Ts And ITs Live In Symbiosis?

IT hypothesis conforms with the age old beliefs about shamanic state as a travel to the interior of Earth. Shamanic state would involve quantum entanglement with IT life forms and sharing of their mental images. One can even imagine that magnetic bodies control several biological bodies, say ordinary biological body and IT body giving rise to a kind of superego-ego-id trinity. In the sequel some aspects of this hypothesis are discussed.

#### How Ts and ITs could communicate?

Ts and ITs could interact via several mechanisms.

1. Communication via sensory representations would mean that for instance our magnetic bodies receive generalized EEG emanating from the biological bodies of ITs and in this manner experiences what it is to be IT. Reception would mean generation of cyclotron transitions. A model for the sensory representations of ITs have been already discussed. Since the cyclotron frequency scales and Josephson frequencies of ITs would differ from ours, positions and widths of EEG bands would be different and if the signal is received it is received by different portions of our magnetic body. For instance, for mantle-core ITs positions and widths of alpha band and its harmonics would be scaled up by  $B/B_E \sim 7$  and positions of beta and theta band relative to alpha band would be scaled up by  $T/T_{room} \sim 13$ .
2. Telepathic communications involving sharing of mental images of ITs by us could be considered. This would mean that our magnetic body entangles with the “brain” of IT or vice

versa by  $W$  MEs. This mechanism would allow also to realize remote motor control of IT (our) biological body by generating dark plasma wave patterns by exotic ionization. If ITs correspond to  $N$ -atoms with different value of  $N$  there are restrictions on this communication mode.

One can imagine several mechanisms of telepathic communications between Ts and ITs.

1. The first mechanism is based on pairs of dark ELF MEs and micro-wave MEs such that microwave MEs propagate like particles inside ELF MEs acting as wave guides and define patterned pulses of duration not much longer than  $T = 1/f$ . For these representations the amplification of micro-wave MEs by piezo-electric quartz crystals in crust and mantle could be involved. Piezo-electricity is basic characteristic of also ordinary life. Microwave hearing for which a concrete model is discussed in [K38], provides a concrete example about this kind of communication: in this case microwave carrier frequency is modulated by audible frequencies. The discrete version of the modulation would be the presence of microwave ME of varying duration or its absence.
2. The second communication mechanism would use pairs of radio wave MEs and MEs at the frequency range of visible light.
3. IT sensory representations generated by ionic cyclotron transition at mantle-core boundary can be realized using lighter ions at the surface of Earth: these ions could belong to our body or brain. Light ions in core-inner core boundary correspond to the frequencies of electronic cyclotron transitions at MHz range at the surface of Earth and provide a mechanism of communications based on active generation of mental images at our end of the communication line.

Microwaves modulated by MHz frequencies are involved with Priore's machine [I28] and the findings of Sue Benford about intentional generation of dots and tracks on photographic emulsions [I34]: the models are discussed in [K38]. Egyptian pyramids have a size scale which corresponds to MHz frequency scale: one can wonder whether these pyramids could have served as amplifiers making possible communications between humans and ITs or between humans and future civilization?

#### 1. *ELF-micro-wave communications*

ELF-micro-wave communications could involve ELF MEs containing micro-wave MEs and coupling to Schumann resonances. Micro-wave MEs would in turn be amplified by quartz crystals.

Quartz crystals are piezo-electrics and ideal for transforming em waves to lattice oscillations and vice versa, and thus also for amplifying em waves. The frequency range of lattice oscillations has the cutoff frequency  $f_c = v/a$ ,  $v$  the velocity of sound in crystal and  $a$  the lattice constant. For  $v = x$  km/s this gives  $f_c = 10^4 \times x$  GHz, which corresponds to infrared photon wave length  $10/x$  micro-meters, so that micro-waves belong to the amplified range. The sizes of connected quartz crystals are bound from below and for the size of order 5 micro-meters, the frequency is about  $.2 \times x$  GHz, so that the length scale range between  $.3 \times x - 5 \times x$  micro-meters covers the frequency range  $.2 - 3$  GHz involved with the micro-wave hearing. At room temperature the values of the longitudinal and transversal velocities of sound in quartz correspond to  $x_L \simeq 2.7$  and  $x_T \simeq 2.0$  for the density for which  $SiO_2$  molecule corresponds to lattice cell with side .1 nm.

Micro-waves are the key controllers of the homeostasis, and quartz crystals could serve as amplifying mediums making possible remote self-organization induced by friendly ITs in the bodies of Ts and based on micro-wave MEs amplified by quartz crystals and propagating along ELF MEs. Shamanic healing could involve this kind of remote self-organization. Thus the old belief that quartz crystals have positive effects on health could have justification.

The correlation between tectonic activity and Schumann resonances on one hand and various altered states of consciousness on the other hand, in particular UFO and ET experiences, could be seen as an evidence for communications with ITs. That micro-waves generated by protein/DNA conformational transitions and rotational transitions of water molecules and their clusters seem to be so important for biological life, might relate to several facts: that quartz crystals in the size scale range defined by cell size amplify them, that they might serve as the "food" of the IT life forms and induce self-organization of T life forms, and that they are involved with the communications between IT and T life forms.

### 2. Radio waves and visible light

Interestingly, kHz frequency, which is the fundamental frequency of terrestrial life (frequency of neuronal synchrony, the time scale of nerve pulse, frequency involved with Kirlian imaging), correspond to a length scale  $r = 3 \times 10^5$  meters. Interestingly, this is nothing but the radius of recently found new core region of Earth, at which Earth's magnetic field corresponds to .2 Tesla important for the plasmoid like life forms. This might be a pure accident but might have some deeper meaning too.

For quartz crystals kHz frequency would require a structure of size  $x$  meters using the parameterization  $v = x$  km/s for the velocity of sound in quartz.  $x = 3.2$  would mean a reasonable size. The thickness of the mantle-core boundary layer is measured in meters so that this layer might contain the needed large quartz crystals. Note that the velocity of sound is inversely proportional to the square root of density so that  $x$  is smaller near the mantle-core boundary and thus also the size of the required structures. For 2 cm sized quartz crystal the frequency would be near electron cyclotron frequency in  $B_{end} = 2B_E/5$  (this is the magnetic field explaining the effects of ELF em radiation in vertebrate brains and might be identified as a dark companion of the Earth's magnetic field).

According to the general model of remote mental interactions ("remote" is actually a very relativistic notion), these radio wave MEs should contain visible light MEs propagating like massless particles inside them and induce self-organization at the receiving end. The question is whether Ts routinely communicate with ITs using kHz radio wave MEs, and whether the neuronal synchrony is a signature of this communication. One can also ask whether terrestrial life could in this manner serve as a source of visible light for IT life in absence of a direct solar radiation. If so, there could be a symbiosis between these life forms and we would be only be at the verge of becoming conscious about this symbiosis.

### 3. Observations about resonance frequencies

One can imagine several resonances possibly relevant for T-IT communications and interactions.

1. The space-time sheet associated with the 20-70 km thick layer defined by the Earth's crust allows cavity resonances just as the 100 km thick layer between the Earth's surface and the lower edge of ionosphere does.
  - i) For the first type of resonances the wave is essentially constant in the radial direction and effectively 2-dimensional: these radial resonances are different from Schumann resonances. For ionosphere the lowest resonance frequency of this kind would be  $\simeq 10$  Hz. For the crust space-time sheet the lowest frequency would vary in the range 16.7 – 33.4 Hz.
  - ii) There are also radial resonances analogous to waves in box in the radial direction. For these resonances the varying thickness  $d = 20 - 70$  km of the crust would correspond to range of frequencies  $f = c/d = 4 - 15$  kHz for radial resonances. The strange 5 kHz sound reported near the crop formations corresponds to the thickness 60 km for the thickness of the crust, and one can wonder whether it also serves as a hint. What is interesting is that the time taken for this kind of radial wave to travel the distance 90+90+60 km from Earth's surface to the ionosphere and back down to the lower boundary of crust corresponds to a time interval which is quite near to the duration  $T = 1/1260$  of the bit of the memetic codon.
2. A further interesting finding is that for  $d = 2900$  km corresponding to the thickness of the mantle, the frequency of the radial waves is  $f_{max} = c/d \simeq 103$  Hz. Hence EEG frequencies correspond to distances larger than the vertical distance to the mantle-core boundary. Of course, the waves need not be purely vertical and this means that waves propagating to the mantle span the range  $f_{max} \times [1/\sqrt{1 + 2R/d}, 1]$ . The lower bound corresponds to 44.4 Hz slightly above the thalamocortical resonance band.
3. Interestingly, the so called taos hum [I26] (which I also personally experience now and then) discussed in detail in [K44] has its fundamental frequency around 80 Hz. Taos hum begins at the sunset and ends at the sunrise, and correlates strongly with the micro-wave static which on basis of its complexity is believed to have a biological origin although to my best but unprofessional knowledge no detailed identification of the source of the static has been

suggested. Could it be that the micro-wave static arrives along vertical MEs connecting Earth's surface with the mantle-core boundary? Micro-wave radiation would be naturally modulated by the 80 Hz resonance frequency and its harmonics and would generate taos hum by the same mechanism as in the case of micro-wave hearing [I23].

Could taos hum be generated by IT life-forms and is it meant to compensate for the loss of the micro-wave radiation coming during daytime from Sun? This would conform with the idea of fractal metabolism involving in an essential manner also micro-wave photons at special frequencies inducing ion flows between space-time sheets, say micro-wave photons at wave length of about 25 cm (6 cm) kicking protons from the magnetic flux tubes of the  $B_{end} = .2$  Gauss to  $k = 151$  ( $k = 149$ ) space-time sheets.

### Paramagnetic rocks, bio-photons, and ITs

Dr. Phil Callahan has made fundamental contributions to the understanding of insect olfaction as infrared vision, and his findings have been of great help in developing quantum model for sensory receptors and sensory organs. The work of Callahan relating to paramagnetic rocks might have non-trivial connection with IT hypothesis.

#### 1. Callahan's findings about paramagnetism

Dr. Phil Callahan has found that the presence of paramagnetic rocks (say granite and basalt: quartz crystals basically) in a combination with a compost and micro-bes facilitate dramatically the growth of plants [I35]. Why paramagnetic rocks are important is that their magnetic field is not fixed as in case of ferromagnets but varies with the external magnetic field and amplifies it. For instance, Schumann contribution to the magnetic field could be amplified. The flux tubes of the amplified magnetic field could also originate from the interior of Earth. Paramagnetically optimal rocks contain magma from volcanic eruptions and thus originating from the region where IT life forms are predicted to exist. Could it be that this material quantum entangles the plants via volcanic material with the ITs and makes communications possible?

Paramagnetism seems to be important for humans too. Callahan has carried out extensive measurements of the level of paramagnetism (presumably defined by the value of magnetic field in the soil) all around the world, and found that the soil in sacred places tends to be more paramagnetic than elsewhere. On basis of his measurements Callahan also reports that the intensity of the oscillating Schumann resonance part of the Earth's magnetic field correlates with the paramagnetic level of the soil. This looks natural since paramagnets amplify the oscillations of the Earth's magnetic field and possibly also those of its dark variant.

Furthermore, on basis of his measurements carried out around Earth Callahan concludes that the Schumann contribution to the Earth's magnetic field is abnormally weak in places where a lot of violence occurs. This kind of correlation is not surprising if magnetosphere, in particular its dark counterpart  $B_{end} = 2B_E/5$  is a living system interacting strongly with biosphere. In TGD framework Schumann resonances mediate horizontal communications between personal magnetic bodies, whose magnetic tubes might reside inside magnetic flux tubes of the Earth's magnetic field or its dark companion  $B_{end}$ . Thus abnormally low intensity of Schumann contribution would weaken the horizontal communications and in turn lead to a weakening of the collective consciousness. Sacred places would in turn be places where horizontal communications are strongest due to the strong Schumann resonance contribution.

#### 2. Bio-photons and paramagnetism: could IT see with phase conjugate laser light?

Callahan has also found that paramagnetic rocks generate bio-photons received by the roots of plants which he believes to act as wave guides. Bio-photons could serve communication purpose. Perhaps ITs communicate using memetic code realized as modulations of the bio-photon beam. This would be consistent with the earlier suggestion that visible MEs propagating along MEs corresponding to frequencies of order kHz are key element of IT-biosphere communication. Quartz crystals with size slightly below micro-meter (cell size) would be ideal for generating the bio-photons. The depth of the cavity below ionosphere is about  $d = 80 - 100$  km whereas the thickness of the space-time sheet associated with the Earth's crust is  $d = 30 - 60$  km. The time taken by a photon to traverse 100 km distance forth and back is .67 ms very near to the duration of the

bit of the memetic codon. Memetic codewords represented as sequences of bits represented by the presence of absence of this kind of back-forth reflected ray might be transformed by quartz crystals to signals propagating to the interior of Earth.

Also negative energy bio-photons analogous to phase conjugate laser beams could be involved. Feinberg has demonstrated that phase conjugate laser beams allow to see the target through say chicken [D1]. The reason is that negative energy photons have energies with magnitude larger than thermal energy, and cannot not be “absorbed” (in this case absorber drops to lower energy state) except resonantly, say when they induce droppings of ions of living matter to larger space-time sheets. This makes this communication mode extremely selective.

Negative energy bio-photons would quite literally allow the ITs to see through the rock. Either ITs could provide energy for biosphere (as suggested by Callahan’s findings) or biosphere could feed ITs. The high temperature of the Earth’s interior would suggest that it we who receive the energy, and ITs who receive the sensory information about the world above Earth’s biosphere!

### **DNA, hallucinogens, shamans, Freud, and myths of Christianity**

Peter Gariaev [I17] has found that the irradiation of DNA by laser light generates radio waves below kHz, and Fritz Popp [I24] has discovered that DNA emits bio-photons with wave lengths in the visible wave length range. Both findings fit with the hypothesis that these telepathic communications occur at DNA level.

In his book “Cosmic Serpent” Jeremy Narby [J19] takes seriously the stories of the shamans about travels under Earth during trance, and the myth that spirits have taught to the people of forests their surprisingly profound wisdom about medicinal plants and skills like weaving and spinning. Narby proposes that snake and double snake encountered universally in the shamanic mythology is a symbol for DNA. He even suggests that DNA and also visible light and radio waves are somehow involved with the telepathic communications during the shamanic trance but does not make guesses about the other participant of these communications.

Besides its extreme complexity and “reality”, the objectivity of the experience supports the view that these experiences are much more than reactions to neuro-physiological disorders caused by drugs. Random input from the brains stem defining a starting point pattern completed by cortex to a sensible experience, was also the earlier view about the origin of dreams but has been given up now. Narby tells about collective experiences in which several participants had same experience, one participant continuing to tell about what he saw, when other participant ceased. The creatures encountered in shamanic experiences, in particular snakes, are same in all cultures. Snakes are seen by shamans even in areas, where snakes are not encountered.

If the communications are based on entanglement at DNA level, one has hopes of understanding the role of various hallucinogens in generating this kind of experiences. Perhaps some neurotransmitters and information molecules, while binding to the neuronal receptors, become molecular mediums entangling us with ITs. Hallucinogens could have more or less permanent entanglement with the IT life forms. Hallucinogens reduce inhibition in brain and this suggests that the role of the inhibition is to de-entangle and thus give rise to modern subjective consciousness in which the sharing of mental images is minimized and the organism behaves highly individually.

Shamans tell that the spirits have very human weaknesses: for instance, they like tobacco more than anything else. Nicotin affects like a neurotransmitter, and also our brains like tobacco. If the ITs share the experiences produced by tobacco smoking, it is easy to understand how sprits can become remote tobacco addicts.

“The mother of a tobacco is a snake” is the title of a chapter in the book of Narby. Collective consciousness associated with the DNA in biosphere and below it could be the mother of tobacco and also the cosmic serpent believed to be the creator of all life-forms. The genetic codes of aliens, to be deduced later from the Crabwood message, encourage to think that ITs are at a higher evolutionary level than us. The myths according to which these spirits created also the life as we see it support the same conclusion. Perhaps IT life forms have actively guided the evolution of life-forms at the surface of Earth, and are doing it right now, and are in this sense creators of life-forms in biosphere. An active genetic manipulation of crops might be occurring in the crop formation areas. Remarkably, some women who have had abduction experiences claim that a cross breeding with aliens is involved with the fetus somehow taken away after some time.

On basis of his lifelong experimentation with certain hallucinogens Terence McKenna [J32],

one of the initiators of quantum consciousness movement at eighties, states that there are myriads of exotic life-forms just here, there is no need to travel to the outer space. In a description of tryptamine induced experiences McKenna says “First of all (and why, I don’t know) you have the impression that you are underground - far underground - you can’t say why, but there’s just this feeling of immense weight above you but you’re in a large space, a vaulted dome...”.

Freud has given a modern formulation for ancient myths in terms of the trinity of super-ego, ego, and id. Magnetic body and higher magnetospheric levels of consciousness would represent the super-ego, physical body the ego, and id would correspond to the IT life-forms, all in a continual telepathic communication with each other. Also the shamanic tradition includes the spirits in the sky to their word order. In Finnish language “Manala”, the place where the dead continue to live and where also shamans visit, means “under ground”. Perhaps the tradition of burying the dead relates to the intuitive idea that dead in some sense continue to live under ground. The Christian myths of holy trinity, of heaven-earthly life-hell trinity, and of ultimate salvation could also reflect the trinity of consciousness and anticipate the inevitable breakthrough of consciousness in which these three levels of self hierarchy become fully conscious of each other.

### Model for the sensory representations and magnetospheric id-ego-super ego trinity

The model for the sensory representations requires a comprehensive view about the structure of the personal magnetic body and its relationship to the Earth’s magnetosphere. One can make only tentative guesses in this respect but quite general arguments lead to a picture supporting the magnetospheric id-ego-super ego trinity.

1. The personal magnetic body interacts with the external world, in particular, with the Earth’s magnetic field and its dark variant and with the solar wind carried by the solar magnetic field. Hence the idea about personal magnetic body as a structure analogous to the Earth’s magnetosphere is worth of testing. Personal magnetosphere could decompose into a part moving with the physical body and analogous to the inner magnetosphere, and a stationary, highly stretched, part analogous to the outer magnetosphere at the night side of Earth. Earth’s magnetosphere-solar magnetic field interaction would be replaced by personal magnetosphere-Earth’s magnetosphere interaction.

There are reasons to believe that one must distinguish between dark magnetic magnetic fields and ordinary ones and that dark magnetic fields are those which are most relevant ones for living systems.  $B_{end} = 2B_E/5$  would be the basic example of a dark magnetic field playing a key role in living matter. What dark space-time sheets with Planck constant not equal to the normal could really be is discussed in detail in [K32].

2. Solar wind would enclose the personal magnetic body inside the Earth’s magnetosphere, whereas the interaction with the flux tubes of the Earth’s magnetic field could force the flux tubes of the personal magnetic body to be more or less parallel to them. Incoherent summation of the personal and terrestrial magnetic fields, fractality, plus the fact that the field strengths associated with the flux tubes of the personal magnetic body should decrease much slower with the distance from Earth’s surface than those of the Earth’s magnetic field, are consistent the possibility that the flux tubes of the personal magnetic body reside inside the magnetic flux tubes of the Earth’s magnetic field in far-away regions.
3. The highly self-organizing plasma sheet at the equatorial plane at the night side of the Earth’s outer magnetosphere is an especially interesting structure as far as personal and magnetospheric sensory representations are considered. For the fractal option the plasma sheet of the Earth’s magnetosphere would contain plasma sheets inside plasma sheets, in particular the plasma sheets associated with the personal magnetic bodies. Personal and magnetospheric sensory representations would correspond to different levels of the same fractal structure.
4. Also the intra-terrestrial part of the Earth’s magnetosphere is important for the magnetospheric sensory representations and, if the fractality hypothesis holds true, also for the personal ones. The strange coincidences of important cavity resonance frequencies of intra-terrestrial structures with EEG resonance frequencies, and the fractal correspondence between the architectures of brain and magnetosphere (discussed in [K44] ) support the view

that personal magnetic body extends also to the interior of Earth. The flux tubes of the Earth's magnetic field (with field strength increasing faster than for the flux tubes of the personal magnetic body) would be however contained *inside* those of the personal magnetic body in this region. The intra-terrestrial consciousness would therefore represent sub-...-selves of ours, something analogous to Id whereas magnetospheric sensory representations would correspond to the super ego. This interpretation conforms with the proposal that intra-terrestrial life forms are possible in the many-sheeted space-time, and that crop circle formations could be interpreted as attempts of ITs to communicate about their existence.

5. Probably it makes sense to speak about  $Z^0$  magnetosphere (both solar and terrestrial).  $Z^0$  magnetic flux tube structures are crucial for the model of long term memories [K70], and the sizes of the flux tube structures associated with the personal  $Z^0$  magnetic body should be measured in light years. This suggests that also much weaker personal magnetic and  $Z^0$  magnetic fields with the lengths of the closed flux tubes measured in light years are relevant.

### Connection with the general view about life cycle of self

By the fractality of consciousness the anatomy of quantum jump represents the general structure of the life cycle of any self. First totally entangled multi-verse is generated, then state function reduction and preparation by self measurements occur and the end result is a maximally un-entangled state. This is what analysis following the birth of an intuitive idea is. By the fractality of consciousness same process occurs also in longer time scales since the sequences of quantum jumps effectively integrate to single quantum jump and the sequences of these effective quantum jumps have similar structure.

What is tragic is that the evolution of self at any level is also a decay process leading to alienation and loneliness at the level of conscious experience of sub-selves. What is consoling is that selves can lose consciousness and wake-up into new childhood. One can say that a healing sleep after a hard day is possible at all levels of self hierarchy.

Also ancient myths inspire to think that this vision applies to the evolution of modern subjective consciousness from more collective consciousness. Jaynes has proposed a vision about how bicameral consciousness [J17], in which the voices of Gods talking to people were talking to everyone, gradually transformed to the modern subjective consciousness. TGD based articulation of Jaynes's views based on the notion of semi-trance is discussed in the last chapters of this book written much before these lines were written.

The basic theme of this evolution is the gradual de-entanglement. The ancient world has survived in fairy tales. In this world remote mental interactions like telepathy, remote healing, and witchcraft were every-day life. Incredible-to-us physical feats like building of pyramids might have been made possible by the liberation of energy and coherent momentum in the formation of collective bound state entanglement. The rhythmic work songs helping to generate body synchrony are a remnant from this period, but are not sung in modern IT companies. Also the strange intra-terrestrial creatures and spirits of magnetosphere; fairies, trolls, eagle-headed humans, dreadful snakes, ..., populated this world. Shamans tell completely seriously to the anthropologists about these creatures without any doubt about their reality. The human sacrifices for Gods, which look extremely cruel to us, were not experienced as such since these people were not individuals with ambitious plans for a lifelong career.

This development has a parallel at the level of personal life. Fairy tales are told to children, who themselves are living the period of oneness. Then these children grow, become more and more rational and analytic. They lose their ability to make choices and there is not much to choose anymore, and become often also lonely and separated. Gradual physical decay adds its own flavor to this process.

The entire evolution can be seen as wake-ups or re-births, bursts of potentialities from which only few are selected during gradual de-entanglement accompanying self-organization, with dissipation serving as the Darwinian selector. Huxley's view about brain as a filter makes sense: our brains minimize the sharing of mental images, which does not aid controlled behavior and survival, and thus make us modern individuals.

Inhibition by various neurotransmitters is a good candidate for a measure for the degree of de-entanglement. Inhibition acts as the filter, which de-entangles the brain from other brains

and the body from the bodies of other life forms. During hallucinatory experiences, generated by say drugs, inhibition “fails”. The degree of inhibition indeed increases, as one climbs along evolutionary tree and in human brain most of the neural activity is inhibition, a rather strange finding difficult to understand in the framework of the ordinary neuroscience.

In accordance with ontogeny recapitulates phylogeny principle, this evolution is seen as an increasing dominance of inhibition during the development of individual leading from spontaneous children to well-behaved and highly controlled adults. Only in some periods of life inhibition fails: during puberty, in physical death and in great turning points of life. Indeed, puberty and physical death are sometimes accompanied by poltergeist phenomena. Physical death also by telepathic phenomena. I experienced telepathic contacts and remote sensory experiences during my great experience. The anthropologist reporting his experience induced by ayahuasca in the book of Narby [J19] tells that the strange creatures that he met told him that usually they are seen only by people who are dying.

This speculative picture could be tested. One could find whether some drugs could enhance telepathic and psycho-kinetic abilities. The “blessed are the meek since they quantum entangle” prediction could be also tested. Indeed, one of the most dramatic experiments supporting psychokinesis was done using chicken which imprinted to a robot [J28]. The robot, whose behavior was programmed earlier by random number generator, tended to stay near the chicken, as if chicken had induced a quantum jumps changing the geometric past in macro-temporal time scales. Also the mysterious ability of birds and fishes to migrate back to their birth places might actually involve quantum entanglement.

Also magnetospheric selves have their own life cycle. As a matter fact, we should be living highly interesting times now. There is a compelling evidence suggesting that pole reversal has already started and occurs during next millenia [J3]. This would perhaps mean a period of sleep for the magnetospheric self followed by a wake-up to a new magnetospheric day. If the proposed general vision is correct, this could have enormous consequences for the character of the magnetospheric collective consciousness. We might be approaching the end of the period of individualization and the decay of the collective consciousness and have hopes about a new collective period.

The myth of salvation might be interpreted as this kind of wake-up of magnetospheric selves after un-conscious period. Note that also magnetospheric selves have geometries memories from the earlier wake-up periods so that dramatic loss of information about past would not be involved. The Omega Point of Teilhardt de Chardin is different articulation of the salvation myth. The rebirth of the magnetospheric selves would presumably mean a conscious sharing of mental images between the various layers of self-hierarchy including ITs, ourselves and magnetospheric selves. At least we have some hopes that the modern “global” market economy is not the final outcome of the human evolution.

### 8.3.7 Some Questions

Unpleasant questions help to clarify thoughts and to see the weak points of the thought constructs.

#### Why crop circles?

The basic goal of aliens is to get us to realize that they are there and that they are receiving information about us. The task is to wake up us from our anthropocentrism and only “miracles” could wake-up us.

Aliens could send radio waves but no one would take seriously a radio amateur telling about messages from aliens. As a matter fact, they might be trying also this: so called electronic voice phenomena (EVP) involve often radio waves ( [J21], see also [K67] ). In some cases the senders of the messages are believed to be physically deceased persons. Very few professional scientists take EVP seriously. UFOs could be also as an attempt to tell to us about the presence of other life-forms but academic community, which is the natural target group, has filtered UFOs from its public consciousness. By their subjective character UFO observations and encounters with aliens can be also claimed to be just hallucinations or hoax. UFOs are also problematic because apart from very few exceptions [J32] they are interpreted as being of extraterrestrial origin. Crop circles might be a more successful attempt since they are static formation and anyone can see them.

The only reasonable strategy for higher life forms to communicate about their existence is to maximize “miracles” and the basic means to communicate is by inducing supra current leakage from their space-time sheets, or space-time sheets that they can control, to our space-time sheets.

1. Using the format of Arecibo message for a crop circle is an ingenious choice. It immediately tells what the message is about; that it cannot be a “natural” phenomenon; and that the senders cannot be at a distance larger than a couple of light decades. All this together with the content of message leaves only the interpretation that they are really here.
2. The small glass and magnetic iron particles and magnetic iron around crop stems are an equally ingenious manner to tell both that the formations are neither “natural” phenomena nor hoax; that mantle-core and core-inner core boundary layers are the places, where the aliens might live; and that alien life forms control liquid glass and iron at atomic space-time sheets. Also the observed artefact like silica crystals suggest the presence of a conscious IT intelligence. Various silicates such as MgO/FeO-SiO<sub>2</sub> dominate in the mantle of the Earth. As will be found in the next chapter devoted to the pre-biotic evolution, crop circles could be also interpreted as giving information about the evolution of life at Earth. Earth consists mostly of ancient meteorites known as chondrites, and carbonaceous chondrites are known to contain organic molecules. Thus IT life might have developed from these molecules in the womb of Mother Gaia and messages might try to tell also about this. Continuing the fractal metaphor, the bio-molecules in meteorites from outer space would take the role of the sperm as in panspermia theory.
3. The micro-wave induced explosions in growth nodes are a further manner to tell the serious researcher that hoax cannot be in question and that micro-waves are crucial aspect for the communications.
4. Of course, there are also other means to communicate. For instance, seismic waves from Earth’s interior might be one manner to communicate and it would be interesting to search for “unnatural” sounds having no identifiable source at the surface of Earth.

### Why not earlier?

There are many reasons for why not earlier.

1. We are now ripe to learn that we are not alone and there is much more advanced civilization just below our feet. This kind of news might have destroyed us just like the encounter with more advanced culture has been fatal for many of the so called primitive cultures. We are now at the verge of having the first TOEs and theories of consciousness, and our self esteem is not destroyed even if we now that those below us have 80 DNAs of something to say and 23 amino-acids to say it (well, this *is* somewhat humiliating!).

One cannot underestimate the importance of web. Web makes it possible to communicate the facts about crop circles demonstrating that they are not hoax. Two decades ago the academic community would have simply silenced these phenomena away.

Everyone knows what fractals are nowadays and also that crop circles do not represent “natural” fractals but those constructed by a mathematician with high aesthetic sense. Thus the fractals are an ideal manner to communicate about the presence of a higher level intelligence.

The explosion of the knowledge about genetic code motivates the attempts to communicate information about the genetic code. Since the images about crop formations are well documented in the web and accessible to anyone, there are good hopes that someone sooner or later notices that the number of the capital letters in the Crabwood message is 20, the number of amino-acids, and gradually realizes that every detail of message is beautiful hint about what the aliens are and where they live. We are also approaching the time when a good theory about alien genetic codes allows us to conclude something about these life-forms and perhaps even produce small alien bacteria in our labs. If code allows to develop new understanding about our own genetic code and how it was evolved, there are even better hopes to get us convinced that the crop formations communicating the code are not hoax.

2. Second reason might be that the situation is getting so catastrophic that they must tell that they are there and willing to help us.

- (a) The magnetic field of Earth has started to flip and this catastrophic event could dramatically affect magnetospheric consciousness.
- (b) There are good reasons to argue that we are an exhausted civilization and decaying, self at a very high age. A period of healing sleep followed by a wake-up to a new magnetospheric day in maximally entangled state of collective one-ness is highly welcome. Magnetic flip is perhaps needed for this and it might be induced intentionally. Earth's magnetic field is indeed highly un-predictable self-organizing structure.

Note that solar magnetic field has memory [E6] and 11+11 year cycle: the interpretation as a sleep-awake cycle of a conscious entity deserves a serious consideration. If the duration of the magnetospheric sleep-wake cycle scales like the inverse of the magnetic field strength, and if the fields strength at the surface of Sun *resp.* Earth is taken to be  $\sim .2$  Tesla *resp.* .5 Gauss, this gives  $4.4 \times 10^4$  year duration for the magnetospheric sleep-wake cycle.  $10^4$  years seems to be the average duration between magnetic flips. This rough estimate is too high by a factor of 4. The Earth's magnetic field has reduced during the last thousand years by a factor of two so that by using the peak values for the magnetic fields of Earth and Sun a better estimate should result. Unlike solar magnetic field, Earth's magnetic field flips in an ir-regular manner (also the sleep-wake periods of infants are irregular, perhaps magnetic Earth lives its magnetic infancy!).

- (c) The magnetospheres of also other planets and helio-magnetosphere have been also changing rapidly during last decades. In [J3] Russian scientist A. M. Dmitriev proposes that a dramatic transformation catalyzed by the collision of the solar system with large plasma clouds in outer space is taking place and affects the whole heliosphere. In TGD based cosmology of consciousness these plasma clouds could correspond to an external plasmoid like intelligence. What is happening would be the heliospheric counterpart for what occurs when I am in a dark wood and suddenly realize that I am not alone: there is something there and it might be dangerous. My every cell is suddenly in a state of full alertness and ready to react, and my brain intensely develops ideas about what might be there and how to react for various options. Perhaps the very fact that human kind is intensely developing consciousness theories, and even what I am writing just now, is part of this intense alertness.

3. Third kind of reasons might relate to the physical prerequisites for sending these messages. There are stringent conditions to be satisfied. Magnetic flux tubes carrying strong local magnetic field of about .2 Tesla are needed: magnetized meteoric iron at magnetic flux tubes might be one means to make flux tubes of Earth's magnetic field to carry this field. Two thirds of the circles involve the meteoric iron. Meteoric iron is not always available. The overall size of the structure depends strongly on the magnitude of the electric field in the region between earth and ionosphere. If it is normal the size scale of circles would be too large and the phenomenon would remain un-detected. The local negative charge possible in limestone regions could be the crucial factor reducing the electric potential and in reducing the size scale of the formations. Also the state of ionosphere depending on factors like the presence sunspots might be important.

Interestingly, during the last decade two sub-belts have emerged inside the inner radiation belt [J3]. The first belt is electronic and at  $r \sim 2R$ ,  $R$  the radius of Earth. The second newcomer contains mainly  $O^+$  ions. Van Allen belts are carriers of magnetospheric sensory representations in TGD. Both the state of van Allen belts and the appearance of crop circles correlate with the solar activity.

### How to communicate with ITs?

These considerations motivate the question how to communicate with the ITs.

1. If the higher life forms behind Chibolton message are indeed ITs, they have received and understood the Arecibo message so that we could continue communicating using this micro-wave wave length using the same frequency modulation based binary code. If ITs are only simple quantum couriers for the civilization of the geometric future, then direct communications with ITs are not so simple. In this case we could however try to establish conscious-to-us communication directly with the civilization of the future: very probably unconscious-to-us communications would be probably occurring all the time. It might be a good idea to try to develop communications based on topological light rays using light at p-adic frequencies utilizing binary cognitive codes [K37]. We could also try to demonstrate the existence of the future civilization by using population inverted lasers at p-adic frequencies to receive negative energy signals from future.
2.  $k = 151$  sheets space-time sheets could couple with DNAs and also with micro-tubules which seem to be basically responsible for our long term memories. The zero point kinetic energy liberated when ion drops from this space-time sheet corresponds to micro-wave energy and scaling law of homeopathy implies that the velocity parameter involved with the process is about 6 m/s: the phase velocity of alpha waves. If DNA provides a direct connection to their world we could try to communicate via DNA: this communication might be occurring unconsciously all the time and alpha waves are the correlate for these communications. Gariaev has found that DNA responds to a visible coherent light by emitting radio waves, and one might imagine of using DNA to transform messages represented using visible light to radio waves and understood by the aliens.
3. Schumann resonances, being cavity resonances, might provide especially effective manner to communicate. In standard physics these waves would not propagate to the interior but in TGD framework this would be possible at non-atomic space-time sheets. Hypnagogic states during which the lowest Schumann resonance dominates in EEG could correspond to these communications.
4. Situation might be even simpler than this: the Crabwood message suggests that the higher life forms talk English and ASCII code fluently, and are at a higher level in the understanding of biology. Perhaps the aliens are receiving information about us all the time and the problem is how to get us to receive the information sent by them! Perhaps the hardest challenge for the aliens is to get us convinced that they really are there.

### Shouldn't volcanoes contain signatures of IT life?

If IT life is really there, volcanoes should be ideal places if one wants to find evidence for it since volcanic eruptions could have brought into daylight both organic material at the colder space-time sheets and liquid glass, perhaps even characterized by complex self-organization patterns. Why traces of life haven't then been found from the surroundings of old volcanoes?

This question does not kill the IT hypothesis. The oldest structures identified as bacterial and cyano-bacterial fossils are accompanied by very complex structures consisting of quartz. The fact that these structures are associated with volcanoes has led to suspect that they do not represent genuine life forms, and a heated debate is going on about this [I7]. The puzzle might be resolved if life has developed also underground, and even before the ordinary life so that the photosynthesizing life as we know it might have developed from primitive IT life forms. The complex quartz structures could be seen as results of an intelligent quantum control. The study of the material associated with the volcanic eruptions provides direct means to test the IT hypothesis.

IT life forms could perform remote metabolism by sending negative energy photons inducing the dropping of ions between atomic space-time sheets and magnetic flux tubes so that zero point kinetic energy becomes usable energy. Negative energy photons of visible light might even make possible primitive remote photosynthesis and ADP-ATP cycle. What I have called miracle wave lengths correspond to p-adic length scales between cell membrane thickness and cell size defined by four Gaussian Mersennes  $(1 + i)^{-1}$  with p-adic length scales  $L(k) = 2^{(k-151)/2} \times 10$  nm,  $k = 151, 157, 163, 167$ . The photon energies are (126, 15.68, 1.96, .49) eV and correspond to the wave lengths (10, 80, 640, 2560) nm. Remarkably, the last two photon energies correspond to the energies

of photon absorbed in photosynthesis and the energy liberated when single ATP molecule is used respectively.

### Are ITs really at higher evolutionary level than us?

The metaphor about Earth's interior as the womb of Mother Gaia suggests that the life at the surface of Earth's is in the same relation as adult to a child. Therefore it seems strange that the genome of ITs would be more complex than that of ours. Also the Freudian IT=Id identification suggest that IT life is more primitive than T life. One can also wonder how a highly advanced intra-terrestrial civilization would see the trouble to and even could hide from us.

This forces to consider the possibility that the senders of the Arecibo message are in the geometric future. This would explain the smaller size of the Sun, that also Mars and Jupiter are populated, and the more complex genome, in particular the presence of silicon in the DNA. This does not mean that one should give up the IT hypothesis. ITs could be simple plasmoid like life forms used by the civilization of the geometric future to carry out simple tasks like building crop circles and even activities related to genetic engineering. This requires that the civilization of geometric future has a highly developed time mirror technology.

### What is the message of the sacred geometry of crop circles?

Astronomer Gerald Hawkins has found that the areas for the circles associated with the crop formations are in diatonic ratios, that is simple rational numbers characterizing the ratios of frequencies for the basic musical scales. According to the theorem deduce by Hawkins, the ratios are simple rational numbers for the areas for circles which are tangential to the sides of any triangle having its vertices at the circumference of a circle [H12]. Surprisingly, no reference to this theorem appears in the works of Euclid or in any book that he has consulted. Crop circle geometries express also simple algebraic numbers such as square roots of small numbers, in particular Golden Mean  $\Phi = (\sqrt{5} - 1)/2$  but also the transcendental number  $\pi$  represented by the circumference of circle.

The use of sacred geometry could try to express some deep message. The most general message would be that rational numbers and more generally, sacred numbers, play a fundamental role in the world order not understood yet by us. The number theoretic formulation of quantum TGD unifying real and p-adic quantum physics to single coherent whole leads to a discovery of number theoretic information measures definable using p-adic norms for rational valued probabilities [?]. If entanglement probabilities are rational numbers, and more generally finitely extended rational numbers, one can assign to them a negative entanglement entropy, and thus positive information measure, whereas ordinary continuum entanglement entropy is positive in all number fields. This kind of entanglement represents bound state entanglement stable under state function reduction and preparation and is the physical correlate for the experience of understanding. One can say that rational numbers and finitely extended rational numbers represent islands of order in the real and p-adic continua.

The number theoretic formulation of TGD inspires some interesting conjectures. In particular, the ratios of  $\pi$ ,  $e$ ,  $\log(p)$ ,  $p$  any prime, and  $\log(\Phi)$ , where  $\Phi$  is Golden Mean, should be rational numbers.  $\pi$  indeed appears in the sacred geometry besides simple algebraic numbers. Thus the message might be that finite-dimensional extensions of p-adic numbers involving algebraic numbers and some selected transcendentals are fundamental for cognitive consciousness as indeed predicted by TGD.

A less general interpretation, which deserves to be noticed, relates to the p-adic length scale hypothesis, which states that p-adic length scales come as square roots of primes. This implies that ratios for areas of p-adically fractally scaled variants of a given structure are ratios of primes.

## 8.4 Number theoretical models for genetic codes

The naïve thinking would suggest that the DNA-amino-acid correspondence is unique and same in the alien biology as in our biology. This is not the case. The notion  $N$ -particle leads to a model how  $N$ -hydrogen atoms define names for molecules and how molecules with conjugate names form especially stable bound states and how the same mechanism explains lock and key mechanism

of bio-catalysis. The lock and key mechanism depends only weakly on chemistry and it is quite possible that several genetic codes are realized.

Hence the tRNA molecules mediating DNA-amino-acid correspondence could be different for various life-forms. The stability of various possible tRNA type molecules determining the code would be determined by the electromagnetic environment. Therefore one must take genetic code as a result of selection. The findings about the alien codes, if taken seriously, suggest also guesses about the origin of the genetic code.

The basic new result inspired by the attempt to identify the alien genetic code is the finding that both our and alien genetic codes factorize in a good approximation to a product codes associated with DNA doublets and singlets. This raises the question whether the factorization occurs also at the level of amino-acids. Could DNAs triplets have resulted as a symbiosis of singlets and doublets whereas amino-acids might have been developed via a symbiosis of 2 (3) molecules coded by 4 DNA singlets and 10 (7) molecules coded by 16 DNA doublets?

### 8.4.1 Three kinds of number theoretical models for the genetic code

TGD has led to three different number theoretic approaches concerning the understanding of the genetic code.

1. In [K37] the model of the genetic code based on the notion of Combinatorial Hierarchy is discussed. This approaches predicts at least one additional code that I have christened memetic code.
2. In [K22] a universal number theoretical code giving genetic code as a special case and based on the maximization of a number theoretic information measure was developed.
3. The model based on the assumption that genetic code has evolved from a product code is the one to be discussed in this chapter (see also the discussion in [K33, K34]).

#### Genetic codes as deformations of product codes

In this section number theoretical models based on the approximate factorization of the genetic code into product code formed by doublet and singlet codes are discussed. Product code as such predicts degeneracies approximately but fails at the level of detailed predictions for DNA-amino-acid correspondences. A volume preserving flow in discrete DNA space is needed to produce realistic DNA-amino-acid correspondences. This flow has the general tendency to cluster amino-acids to connected vertical stripes inside the 4-columns appearing as elements of the  $4 \times 4$  code table, whose elements are labelled by the first two bases of DNA triplet. One can invent an information maximization principle providing a quantitative formulation for this tendency.

#### Genetic codes based on the maximization of number theoretic information measure

In the chapter [K22] an alternative number theoretic model for the ordinary genetic code and its variants is discussed. This model is based on very general number theoretic notions, in particular, number theoretical generalization of Shannon entropy, and must be regarded as the most convincing one of the three number theoretic models constructed hitherto. This model allows to identify ordinary genetic code and its variants as codes maximizing a unique number theoretic information measure. The model is also consistent with the idea that genetic code has evolved from a product of singlet and doublet codes.

The model predicts the number for “amino-acids” once the number  $n$  of “DNAs” is known as  $N(n) + 2$ , where  $N(n)$  is the number of primes not larger than  $n$ . For 80 DNA triplets the prediction would be  $24 = 3 \times 8$  rather than 23 amino-acids. Hence the two models for the genetic code would not be consistent.

Before making any hasty conclusions one should recall that the interpretation of the Crabbwood circle as ASCII text involves considerable uncertainties. A modification of single special symbol or small letter to a symbol not appearing in the proposed interpretation of the Crabbwood message would give 24 “amino-acids”. For instance, the ASCII symbols for dot *resp.* comma are 00110100 *resp.* 01110100 and differ only by a single bit so that misinterpretation cannot be excluded.

This model of genetic code emerged much later than the model for alien genetic codes and is not discussed in this chapter.

### 8.4.2 Does amino-acid structure reflect the product structure of the code?

The exact A-G symmetry and the almost exact T-C symmetry of our genetic code supports approximate  $2 \times 10$  structure such that 16 DNA doublets and 4 DNA singlets code for 10 *resp.* 2 “pre-amino-acids” which combine to form the real amino-acids. The  $3 \times 7$  decomposition of the number 21 of amino-acids plus stopping sign suggests  $3 \times 7$  decomposition of the genetic code. This decomposition is however not favored by the symmetries of the genetic code.

The coding of amino-acids involves tRNA binding with amino-acids and this means that the structure of amino-acids need not reflect the product structure of the genetic code and it might be that only the structure of tRNA reflects the product structure. Indeed, the identification of pre-amino-acids as DNA singlets or doublets dictated by RNA-DNA translation mechanism is strongly favored by the physical model for the evolution of the genetic code. With this identification triplet pre-amino-acids (DNA triplets) are simply composites of doublet and singlet pre-amino-acids (DNA doublets and singlets).

Despite this interpretation, the study of the amino-acid geometric structure is in order. It does not reveal any obvious structural  $3 \times 7$ -ness or  $2 \times 10$ -ness. One can however wonder whether this kind of structures might be present at more abstract level and present only in the interactions of tRNA and amino-acids.

#### 1. $2 \times 10$ product structure at amino-acid level

$2 \times 10$  decomposition for real amino-acids might approximately correspond to hydrophobic-hydrophilic dichotomy which plays a key role in the amino-acid chemistry. This correspondence cannot be very precise since the number of the hydrophobic (-philic) amino-acids is 8 (12) rather than 10 (10). Of course, this is what one expects since the product symmetry is broken.

#### 2. $3 \times 7$ product structure at amino-acid level

Aminocids can be classified into three groups. The first class contains 8 hydrophobic non-polar amino-acids: ala, val, leu, ile, pro, met, phe, trp, Second class consists of 7 hydrophilic polar amino-acids gly, ser, thr, cys, asp, glu, tyr. The third class consists of polar hydrophilic acidic amino-acids asp, glu and hydrophilic basic amino-acids lys, arg, his: 5 altogether.

Could these three classes correspond to the  $3 \times 7$ -ness?

1. First of all, the non-varying group contains almost(!) as a rule both the acidic carboxy group  $COOH$  which tends to ionize to  $COO^-$  and basic aminegroup  $NH_3$  which tends to ionize to  $NH_3^+$ . When carboxy or amine group is associated with the side group, the  $2+3=5$  acidic or basic polar amino-acids result. Thus the three-ness in standard sense corresponds to the difference for the total numbers of acidic and basic groups of the side chains: amino-acid side chain is either neutral and non-polar, neutral and polar, or charged. This leads to  $8+7+5$  decomposition and a slight breaking of three-ness.
2. One could however consider a modified definition in which one counts the numbers  $N_+$  of basic and  $N_-$  of acidic groups of the *entire* amino-acid and uses the difference  $N_+ - N_-$  to tell the net charge of the amino-acid. If this criterion is used, the first group contains one alien, proline. Proline differs from all other amino-acids in that the neutral group  $H_3N^+ - COO^- - C - H$  group is replaced by a charged  $HN - COO^- - C - H$  group. But this means nothing but replacing the basic group  $NH_3^+$  with a non-basic NH. This implies also a net charge for proline. If net charge is taken as the characterizing property of the third group of amino-acids, proline belongs to it. Therefore first and second would group contain 7 amino-acids and the third group would contain 3 positively charged and 3 negatively charged amino-acids.
3. If one thinks that stopping sign formally corresponds to one additional amino-acid in the third group, one indeed has  $7+7+7$  decomposition. For some rare life-forms to be discussed later stopping sign codon ATC can code for both stopping sign and non-standard amino-acid

pyrrolysine depending on context [I5]. Pyrrolysine, being a derivative of lysine, is basic so that in this case one would have  $7+7+7$  decomposition even without counting stopping sign formally as an amino-acid.

The 7-ness index labelling the amino-acids with the three groups should be some abstract property and it is impossible to make any conclusions on basis of the chemical formulae alone.

*3. Is the product structure at the level of amino-acids really needed?*

It has become clear that the product structure for amino-acids is not necessary.

1. The number theoretic model of the genetic code discussed in [K22] neither predicts nor requires the product structure for amino-acids but is consistent with the approximate product structure for codons.
2. In [K33, K34] a model for the evolution of the genetic code from a product code mapping RNAs to a subset of RNAs is studied. In this model the product structure at the level of coded RNAs is natural but there is no reason for it at the level of amino-acids which, according to the model, originally only catalyzed RNA  $\rightarrow$  RNA mapping but later replaced the coded RNAs in a kind of palace revolution.

### 8.4.3 Number theoretical model for the terrestrial genetic code

The study of the terrestrial genetic code allows to deduce the process leading to the breaking of the product symmetry and T-C symmetry. This process turns out to work as such also in case of alien codes.

#### Approximate reduction to a product code

The dependence of the amino-acid coded by DNA on the third codon of DNA triplet is weak and Crabwood message suggests that both doublet and triplet codes are realized. This inspires the guess that triplet code might have evolved as a fusion of doublet code and singlet codes.

This should be reflected in its structure. There are two options.

1. The decomposition  $20 = 2 \times 10$  for real amino-acids suggest that singlet code maps four bases to 2 “pre-amino-acids” such that A and G resp. T and C are mapped to same pre-amino-acid, and 16 doublets to 10 “pre-amino-acids”. The exact A-G symmetry and almost exact T-C symmetry of our genetic code support this interpretation.
2. The decomposition  $21 = 3 \times 7$  for amino-acids plus stopping sign suggests that singlet code maps four bases to 3 “pre-amino-acids” and 16 doublets to 7 “pre-amino-acids”. In the first approximation the triplet code would decompose to a product of doublet code and singlet code in the sense that 4 singlets are mapped to  $Z_3$  and 16 doublets are mapped to  $Z_7$  so that 21 different product states result. The decomposition of the statements consistent with some atomic statements suggests itself strongly. In the first approximation the triplet code would decompose to a product of doublet code and singlet code in the sense that 4 singlets are mapped to  $Z_3$  and 16 doublets are mapped to  $Z_7$  so that 21 different product states result. The problem of this option is that it predicts complete breaking of T-C symmetry and the breaking of the product symmetry should produce T-C symmetry. This looks two complicated.

Product code hypothesis is very strong since the degeneracies of the product code are products of the degeneracies for the composite codes so that the number  $n_{AB}$  of DNA triplets coding a given amino-acid having the product form “AB”, to be referred as the degeneracy of the amino-acid, is given by the product

$$n_{AB} = n_A \times n_B$$

of the degeneracies of the “pre-amino-acids” A and B. Here A and B can refer to  $(A, B) = (3, 7)$  or  $(A, B) = (2, 10)$  respectively.

n	1	2	3	4	6
N(prod)	0	12	0	4	4
N(real)	2	9	2	5	3

**Table 8.10:** The numbers  $N(n)$  of amino-acids coded by  $n$  DNAs for unperturbed  $2 \times 10$  product code and for the real genetic code for  $2 \times 10$  option.

The number  $N_{AB}(n)$  of amino-acids with given degeneracy  $n$  is given by the formula

$$N_{12}(n) = \sum_{n_1 \times n_2 = n} N_1(n_1)N_2(n_2) ,$$

where  $N_1(n_1)$  resp.  $N_2(n_2)$  is the number of pre-amino-acids with the degeneracy  $n_1$  resp.  $n_2$ .

For  $2 \times 10$  case singlet sector allows only single candidate for the code since the genetic code has exact A-G symmetry and almost exact T-C symmetry with respect to the last base. Thus A and G code for the first pre-amino-acid and T and C the second one. A breaking of the T-C symmetry is needed to obtain realistic code.

In  $3 \times 7$  case singlet code would have following interpretation.  $Z_3$  is identified as negations of 4 selected statements with 00 excluded. Statement and its negation are projected to this  $Z_3$  representing negations with 00 excluded so that 11 must be projected to some other statement. The degeneracies of the code are unique: 2, 1, 1 since any change of the code changing this degeneracy spectrum implies that one degeneracy vanishes.

Same applies to  $Z_7$  and 16 DNA doublets. Now 1111 is mapped to some statement in the set of negations. In this case the simplest coding is obtained by mapping 7 statements to their conjugates and the two remaining statements to different conjugate statements in the set of 7 statements. The resulting degeneracy structure is 2222233 and entropy is maximal for this code.

### Our genetic code as result of symmetry breaking for $2 \times 10$ product code

As found, there are two cases to be considered:  $3 \times 7$  T-C asymmetric and  $2 \times 10$  T-C symmetric product code. The approximate T-C symmetry favors strongly  $2 \times 10$  option and  $3 \times 7$  will be considered only briefly in a separate subsection. On basis of degeneracies alone it is not possible to distinguish between these codes and  $3 \times 7$  code was in fact the first guess for the product code.

In case of  $2 \times 10$  code the decomposition of 16 DNA doublets giving almost the degeneracies of our genetic code is (3322 111 111).

$$(2 \oplus 2) \times (3 \oplus 3 \oplus 2 \oplus 2 \oplus 6 \times 1)$$

This gives

It is important to notice that the multiplets appear as doubled pairs corresponding to A-G and T-C symmetries. One generalized amino-acid (which cannot correspond to stopping sign) is lacking and must result by a symmetry breaking in which one amino-acid in the code table is transformed to a new one not existing there. Alternatively three amino-acids are transformed to stopping signs.

It is easy to find the deformation yielding correct degeneracies by removing DNAs from the DNA-boxes defined by various values of degeneracies to other boxes and adding them to other boxes. The rule is simple: taking  $m$  DNAs from a box containing  $n$  DNAs creates a box with  $n - m$  DNAs and annihilates one  $n$ -box:

$$N(n) \rightarrow N(n) - 1 , \quad \text{and} \quad N(n - m) \rightarrow N(n - m) + 1 .$$

If one adds  $k$  of these DNAs to  $r$ -box one has

$$N(r) \rightarrow N(r) - 1 , \quad N(r + k) \rightarrow N(r + k) + 1 .$$

The operation which is not allowed is taking the entire content of a DNA box defined by amino-acid and adding it to other boxes since this would mean that the amino-acid in question would not be coded by any DNA. Thus the number of boxes can only grow in this process.

Realistic degeneracies are obtained by a rather simple operation.

1. Take from one 6-plet two amino-acid and move the first of them to 2-plet to get  $N(6) = 3$ ,  $N(4) = 5$ ,  $N(3) = 1 < 2$ ,  $N(2) = 11 > 9$  and move the second one to hitherto non-existing singlet to get  $N(1) = 1$ .
2. Move one DNA from some doublet to second doublet to get triplet and singlet to get  $N(1) = 2$ ,  $N(2) = 9$  and  $N(3) = 2$ . This operation gives correct degeneracies only and it turns out that correct symmetry structure requires additional operations.

#### Failures of the product structure and the symmetry breaking as volume preserving flow in DNA space

A slightly broken product structure allows to understand the degeneracies of our genetic code relatively easily. It however leads also to wrong predictions at the level of DNA-amino-acid correspondence.

1. Exact product structure predicts that all 4-columns  $XYU$ ,  $U = A, G, T, C$  appearing as elements of the code table labeled by first and second bases of DNA triplet should have similar amino-acid structure. For  $3 \times 7$  code the 4-column should have  $AABC$  structure. This is not case. Almost all 4-columns have  $AABB$  structure and there are also many  $AAAA$  type 4-columns. For  $2 \times 10$  code the prediction is that all 4-columns should have  $AABB$  structure and this prediction breaks down only for  $AAAA$  type 4-columns.
2. For  $3 \times 7$  code a given amino-acid should be coded by DNA pairs of form  $(XYA, XYG)$ , or DNA of form  $XYC$  or  $XYT$ . For  $2 \times 10$  code a given amino-acid should be coded either by DNA pairs of form  $(XYA, XYG)$  or of form  $(XYC, XYT)$ . This is not the case. A given amino-acid tends to appear as connected vertical stripes inside the elements of the  $4 \times 4$  table (4-columns). For instance, all 4-columns of form  $AAAA$  ( $A = \text{leu, val, ser, pro, thr, ala, arg, gly}$ ) and 3-column ile break the prediction of the product code.
3. For  $3 \times 7$  each 2n-plet formed by degenerate  $(XYA, XYG)$ -pairs is accompanied by n-plets of type  $XYT$  and  $XYC$ . In case of  $2 \times 10$  2n-plet formed by  $(XYA, XYG)$ -pairs is accompanied always by an 2n-plet formed by  $(XYT, XYC)$  pairs. By studying the degeneracies of the codes one can get idea about how good these predictions are.

It seems that the breaking of the product symmetry tends to form connected vertical clusters of amino-acids inside a given element of the  $4 \times 4$  code table but that one cannot regard stripes longer than 4 elements as connected structures. The  $2 \times 10$  structure is favored by approximate T-C symmetry, and one can imagine that relatively simple flow in DNA space could yield the desired condensation of the amino-acids to form connected vertical stripes. The most general flow is just a permutation of DNAs and obviously preserves the degeneracies of various amino-acids. There are  $64!$  different permutations but A-G and T-C symmetries reduce their number to  $32!$ .

The idea about discrete volume preserving flow in DNA space can be made more precise. A-G and T-C gauge symmetries suggest the presence of a discrete symplectic structure. Perhaps one could regard  $16 \times 4$  DNAs as 16 points of 4-dimensional discrete symplectic space so that the canonical symmetries of this space (volume preserving flows) acting now as permutations would be responsible for the exact A-G gauge invariance and approximate T-C gauge invariance. This brings in mind the canonical symmetries of  $CP_2$  acting as  $U(1)$  gauge transformations and acting as almost gauge symmetries of the Kähler action.

A natural guess is that the DNAs coding same amino-acid tend to be located at the same column of the  $4 \times 4$  code table before the breaking of the product symmetry. If this is the case then only vertical flows need to be considered and A-G and T-C symmetries imply that their number is  $8!^4$  corresponding to the four columns of the table.

The **Table 8.13** summarizes our genetic code. It is convenient to denote the rows consisting of A-G resp. T-C doublets by  $X_1$  and  $X_2$ . For instance,  $A_1$  corresponds to the highest row phe-phe, ser-ser, tr-tyr, cys-cys and  $G_2$  to the row leu-leu, pro-pro, gln-gln, arg-arg.

	A	G	T	C	
A	phe	ser	tyr	cys	A
	phe	ser	tyr	cys	G
	leu	thr	stop	thr	T
	leu	thr	stop	thr	C

	val	ala	glu	gly	C
	leu	pro	gln	arg	T
	leu	pro	gln	arg	C
T	ile	ser	asn	ser	A
	ile	ser	asn	ser	G
	met	thr	lys	arg	T
	met	thr	lys	arg	C
C	val	ala	asp	gly	A
	val	ala	asp	gly	G
	leu	pro	his	arg	A
	leu	pro	his	arg	G

**Table 8.11:** Code table before the flow inducing the breaking of the product symmetry.

1. The simplest hypothesis is  $2 \times 10$  option is realized and that the flow permutes entire rows of the code table consisting of A-G and T-C doublets. From **Table 8.11** it is clear that there is a G-C symmetry with respect to the first nucleotide broken only in the third row. This kind of primordial self-conjugacy symmetry would not be totally surprising since first and third nucleotides are in a somewhat similar position.
2. There are 3 6-plets leu, ser, and arg, and it is easy to see that one cannot transform them to the required form in which all 6-plets are on A-G or T-C row alone using this kind of transformation. For instance, one could require that leu doublets correspond to T-C doublets before the symmetry breaking. This is achieved by permuting the  $G_1$  row with the  $C_2$  row. Since  $A_2$  contains also ser-doublet, also ser must correspond to T-C type 6-plet, and since arg is contained by  $G_2$  row, also arg must correspond to T-C type 6-plet. Thus there would be 4 T-C type 6-plets but the product code gives only 2 of them.
3. The only manner to proceed is to allow mixing of suitable 6-plet of A-G type and 4-plet of T-C type in the sense that A-G doublet from 6 is moved to T-C doublet inside 4-plet and T-C doublet in 4-plet is moved to A-G doublet inside 6-plet. The exchange of  $AG_2$  (ser doublet) and  $TG_1$  (thr-doublet) represents this kind of permutation.

The tables below summarize the three stages of the construction.

At the last stage the T-C symmetry breaking giving rise to bla-trp and ile-met doublets occurs.

1. thr 6-plet is transformed to 4-plet by replacing thr-thr in  $AC_2$  by bla-trp. trp is the missing amino-acid.
2.  $TA_2$  met-doublet is transformed to ile-met so that the realistic genetic code results.

One might argue that symmetry breaking permutations  $G_1 - C_2$  and  $AG_2 - TG_1$  should permute amino-acids with a similar chemical character. A similar constraint applies to T-C symmetry breaking. By studying the chemical structure of the amino-acids, one finds that this is satisfied to a high degree.

1. The permutations val-leu and ala-pro exchange amino-acids with non-polar (hydrophobic) sidegroups. The permutations glu-his and gly-arg exchange polar (hydrophilic) amino-acid with a polar amino-acid which is also basic. Ser and thr are both non-polar amino-acids.

	A	G	T	C

	val	ala	asp	gly	G
	val	ala	glu	gly	T
	val	ala	glu	gly	C

**Table 8.13:** The code table after the T-C symmetry breaking

2. ile and met are both non-polar so that ile→ met replacement satisfies the condition.
3. The objection is that the side group for trp is non-polar but polar for thr. Interestingly, the code table decomposes to two connected regions corresponding to non-polar/polar side groups at the left/right such that the non-polar trp located inside the polar region is the only black sheep whereas thr naturally belongs to the polar region. As will be found trp is also otherwise singular case.

**Figure 8.4:** The chemical structure of amino-acids. The first group (ala, ...) corresponds to non-polar amino-acid side groups, the remaining amino-acids to polar side groups. The two lowest groups correspond to acidic (asp, glu) and basic side groups.

A working hypothesis worth of studying is that the symmetry breaking mechanism is universal and applies also to the capital letter code and even to the small letter + special symbol code in an appropriately generalized form. This hypothesis is highly predictive, and the fact that one can produce these codes using the product ansatz, the same “volume preserving flow”, and T-C symmetry breaking, encourages to think that the picture has some truth in it.

### The information maximization principle determining the “volume preserving flow”

The interaction between the DNA singlets and doublets is the physical explanation for the breaking of the product symmetry. This interaction involves two parts: the flow and T-C symmetry breaking. The flow is analogous to the formation of connected vertical stripes of amino-acids in DNA space: kind of condensation process in which different phases represented by amino-acids tend to condense to form regions consisting of at most 4-units of type  $XYU$ ,  $U = A, G, T, C$ . Obviously this means continuity and thus also symmetry analogous to that emerging when (amino-acid) gases condense to a liquid state: the breaking of the product symmetry is the price paid for this additional symmetry. It turns out to be possible to formulate a variational principle consistent with the proposed flow in the direction of the columns of the code table and defining the dynamics of the condensation.

What this means that one can assign an information measure to the code table such that the volume preserving flow in question maximizes this information measure.

1. Information measure is assumed to be local in the sense that it decomposes into a sum of information measures associated with the elements  $C_{AB}$ ,  $A, B \in \{A, G, T, C\}$ , of the  $4 \times 4$  code table (elements are 4-element columns). In the physical analogy this means that the condensed droplets of various amino-acids can have at most the size of single 4-element column.
2. Consider the element  $C_{AB}$ . Let the multiplet associated with the amino-acid  $a_k$  contain  $n(k, AB)$  amino-acids and let  $i(k, AB)$  tell the number of the disjoint parts to which the amino-acidss  $a_k$  in the 4-plet  $AB$  split. The number of these disjoint multiplets can be 0, 1, 2.

Let the  $i$ : th region contain  $n(k, AB, i)$  amino-acids  $a_k$ . The meaning of the equations

$$\begin{aligned}\sum_{i=1}^{i(k, AB)} n(a_k, AB, i) &= n_k(AB) \ , \\ \sum_{AB} n_k(AB) &= n_k \ , \\ \sum_k n_k &= 64\end{aligned}$$

is obvious.

Assign to the  $i$ : th connected region containing  $n(k, i, AB)$  identical amino-acids  $a_k$  probability

$$p(k, i, AB) = \frac{n(k, i, AB)}{64} \ ,$$

to the element  $AB$  the total probability

$$p(k, AB) = \sum_{i=1}^{i(k, A, B)} p(k, i, AB) \ ,$$

and to the entire table the probability

$$p_k = \sum_{AB} p(k, AB) = \frac{n(k, AB)}{64} \ .$$

The sum of the probabilities associated with various amino-acids satisfies

$$\sum_k p_k = 1 \ .$$

The information measure associated with amino-acid  $a_k$  element  $AB$  is defined as

$$I(k, AB) = \sum_{i=1}^{i(k, A, B)} p(k, i, AB) \times \log[p(k, i, AB)] \ ,$$

Note that this number is non-positive always. The total information associated with the amino-acid  $a_k$  in code table is defined as

$$I(k) = \sum_{AB} I(k, AB) \ .$$

The total information of the code table is defined as the sum of the information measures associated with various amino-acids:

$$I = \sum_k I(k) \ .$$

This information measure is maximized (which means the minimization of the absolute value of the measure since one can speak of the minimization of entropy) by the vertical flow satisfying the previous constraints, and thus satisfying the constraints that the numbers  $a_k$  of various amino-acids are fixed and  $A \leftrightarrow G$  and  $T \leftrightarrow C$  symmetries are respected. There is a direct analogy with thermodynamical equilibrium with fixed particle numbers and symmetry. The equilibrium is characterized by the chemical potentials associated with the amino-acids. There is no temperature type parameter now.

The variational principle indeed favors the formation of vertically connected regions consisting of  $n = 2, 3$  or 4 amino-acids. By construction the variational principle does not tell anything about larger regions. In particular, it is more favorable for 4 amino-acids in a given column (say ser in the second column of the table) to be contained by single element than by 2 elements since the information measure would be  $-1/16 \log(1/16)$  for two disjoint doublets and  $-1/16 \log(1/8)$  for singlet 4-plet in same element and thus smaller in absolute value. In the similar manner the AAAB decomposition of singlet element instead of say AABA is favored.

### The deviations from the standard code as tests for the basic symmetries of the model

The deviations of the terrestrial genetic code from the standard code [I5] provide a testing ground for the postulated symmetries of the genetic code and might also help to deduce the alien codes.

The deviations from universality of the Start codon (coding for met) and stop codons are very rare. With two exceptions all known deviations from the standard code are located in the first and fourth columns of the code table. For the first exceptional case the codon is ATC in the third column and codes for both stopping sign and pyrrolysine, which is an exotic amino-acid. It is somewhat a matter of taste whether one should say that the universality of the third column is broken or not since, depending on context, ATC codes stopping sign or pyrrolysine. Second exceptional case corresponds to the use of two stop codons to code amino-acids and this necessarily breaks the universality of the third column in T-C 2-subcolumns. The construction of the small letter code indeed forces to assume this kind of breaking of universality. No violations of the predicted A-G symmetry and the universality of the second column of the code table are known.

The deviations from the standard code [I5] provide valuable hints when one tries to deduce information about the alien codes.

1. Consider first the mitochondrial genes.
  - i) Mitochondrial codon ACT from animals and micro-organisms (but not from plants) codes trp instead of stopping sign.
  - ii) Most animal mitochondria use TAT to code met instead of ile.
  - iii) Yeast mitochondria use GAX codons to code for thr instead of leu. This suggests that also in the case of the capital letter code the amino-acid coded 8 times is thr. In case of the small letter + special sign code the 13-fold degenerate amino-acid could be thr.
2. The violations of the universality are very rare for nuclear genes. A few unicellular eukaryotes have been found that use one or two of three stop codons to code amino-acids instead. The use of two stop codons to code amino-acids necessarily violates the universality of the third column but need not break the universality for the embedding of amino-acid space to DNA space.
3. There are also two non-standard amino-acids: selenocysteine and pyrrolysine.
  - (a) Selenocysteine is encoded by ACT (fourth column) coding stopping sign normally. Interestingly, ACT codes also stopping sign and the translation machinery is somehow able to discriminate when selenocysteine is coded instead of stop. This codon usage has been found in certain Archaea, eubacteria, and animals. This deviation means that the number of amino-acids is 21 or 20 depending on context. This conforms with the view that number 21 indeed has a deep number theoretical meaning and that one can regard stopping sign formally as amino-acid.
  - (b) In one gene found in a member of the Archaea, exotic amino-acid pyrrolysine is coded by ATC, which corresponds to the lower stopping sign in the code table. This case

n	1	2	3	4	6
N(prod)	0	12	0	4	4
N(real)	2	9	2	5	3

**Table 8.14:** The numbers  $N(n)$  of amino-acids coded by  $n$  DNAs for unperturbed  $2 \times 10$  product code and for the real genetic code for  $2 \times 10$  option.

represents the only deviation from universality of the third column of the code table but even in this case also stopping sign is coded. How the translation machinery knows whether to code pyrrolysine or to stop translation is not yet known. TGD would suggest that electromagnetic signalling mechanisms (“topological light rays”) might be involved.

The small variants of the letters K and V are lacking from small letter+special sign code. This might signal that the corresponding amino-acids are replaced by selenocystein and pyrrolysine represented by  $h$  and  $\backslash$  in the small letter code.

#### 8.4.4 Capital letter code as a product code with broken T-C symmetry

What about capital letter code: does it also have approximate product structure? Product structure predicts that many degeneracies, in particular the largest degeneracies should be divisible by two. In case of  $2 \times 10$  code all degeneracies are predicted to be divisible by two. This is not the case now as **Table 8.13** shows. One can however try to find a product code which is as near as possible to the real one.

The degeneracies 111111234 for the doublet  $2 \times 10$  representation differs from our genetic code in that 1111112233 is modified to 111111234. These degeneracies would be the degeneracies most naturally associated with the 16 DNA doublet code with 10 “pre-amino-acids” possibly associated with plasmoid like life forms serving as messengers of the aliens.

The simplest option would be that this correspond to taking one doublet from second 2 and adding it to second 3 so that one additional singlet results. Unfortunately, the fact that stopping sign has degeneracy 7(8) excludes this option.

The 111111234 decomposition predicts the following numbers for DNAs with various degeneracies. Also the corresponding numbers for capital letter code are included.

The following process gives the degeneracies of the OPpose code.

1. Take one DNA from second 8-plet and add it to 6-plet to get two 7-plets so that one has  $N(7) = 2$  and  $N(6) = 1 > 0$ .
2. Change one DNA in 6-plet to the DNA which does not exist in the table to get  $N(6) = 0$ ,  $N(5) = 1$ ,  $N(1) = 1$ . The non-existing DNA is generated in essentially the same manner also in case of our code.
3. One can transform 7 2-plets into 2 3-plets, 4-plet and 4 singlets as follows. Take from two doublets one DNA and move them to third doublet to get  $N(1) = 3 < 5$ ,  $N(2) = 11 > 7$ , and  $N(4) = 3$ . There are four superfluous doublets remaining and forming pairs. For each pair take DNA from one doublet and move it to second one to get  $N(1) = 5$ ,  $N(2) = 7$  and  $N(3) = 2$ .

Assuming that the decomposition of DNA doublets is obtained from that for our code in the proposed manner and that the same flow induces T-C symmetric part of the breaking of the product symmetry, one can fix the DNA-amino-acid correspondence highly uniquely for the capital letter code. The unbroken code contains two octets. Since for yeast mitochondria both GA and TA columns code for thr, the guess is that the second octet corresponds to thr. The second octet must be ser from the product symmetry. The requirement that the code table resembles as much

	val	ser	asp	gly	G
	val	asp	asp	gly	T
	val	ala	glu	gly	C

**Table 8.17:** Capital letter code table after the T-C symmetry breaking

as possible the code table of our genetic code leads to the following working hypothesis for the code table before symmetry breaking.

T-C symmetry breaking can be understood as follows.

1. Take one DNA from second 8-plet (ser or thr and add it to 6-plet representing stopping sign to get two 7-plets so that one has  $N(7) = 2$  and  $N(6) = 1 > 0$ . Thr is chosen in the sequel for definiteness and corresponds to TGC.
2. Change one DNA in thr 6-plet to the DNA which does not exist in the table to get  $N(6) = 0$ ,  $N(5) = 1$ ,  $N(1) = 1$ . The non-existing DNA is generated in essentially the same manner also in case of our code. stop at ACT is transformed to trp as so that trp is in the same position as in our genetic code.
3. What one must do is to transform 7 2-plets into 2 3-plets, 4-plet and 4 singlets. This is achieved in the following manner.
  - (a) Take from two T-C doublets one DNA and move them to a third doublet to get  $N(1) = 3 < 5$ ,  $N(2) = 11 > 7$ , and  $N(4) = 3$ . For instance, this is achieved by transforming glu and ala to asp. The value of information measure decreases by  $\log(64/27)$  in this process. There are also many other ways to do this.
  - (b) There are four superfluous doublets remaining and forming pairs. For each pair take DNA from one doublet and move it to second one to get  $N(1) = 5$ ,  $N(2) = 7$  and  $N(3) = 2$ . More concretely  $(AA)_2$  leu doublet is transformed to phe-leu, and  $(TA)_2$  met-doublet is transformed to ile-met so that correct degeneracies result and the information measure increases in these processes by  $2 \times \log(27/16)$  which is larger than  $\log(64/27)$  so that the net increase of the information measure is positive in the entire process.

The process is not obviously completely unique but the proposed choice is favored because the small letter+special sign code can be obtained as a small deformation of this code.

#### 8.4.5 T-C symmetric models for small letter plus special symbol code

One can apply T-C symmetric product model with symmetry breaking also to the code candidates involving small letters. There are three candidates for these codes.

n	1	2	3	4	5	6	8	9	10	12	13
N	0	16	0	4	0	2	0	0	2	0	0
N	10(9)	4(5)	0	3	2(3)	3(2)	0	1	0	0	1

**Table 8.18:** The numbers  $N(n)$  of amino-acids coded by  $n$  DNAs for code containing small letters and special symbols for  $2 \times 12$  option. Both OPpose and Oppose options are included.

1. The  $4 \times 17$  code with 18 amino-acids involving only small letters with  $h$  interpreted as stopping sign: this code makes sense for Oppose option only and since the expressive power is not maximal, it will not be discussed in the sequel.
2.  $4 \times (16 + 4)$  code with 23 generalized amino-acids ( $\backslash$ ,  $h$ , and special symbols  $!$ ,  $\&$ ,  $.$  are interpreted as belonging to the extended family of amino-acids).
3. The  $4 \times (16 + 4)$  code with 20 amino-acids ( $\backslash$  and  $h$  are interpreted now as amino-acids). This code results from the code with 23 generalized amino-acids by assuming that the DNAs coding for  $!$ ,  $\&$  and period code for the stopping sign.

The candidates 2) and 3) appear as Oppose and OPpose options.

### The nature of silicon modification

The product model for the genetic codes suggests an interpretation of the small letter codes. The Chilbolton message tells that also silicon is fundamental for the alien life at DNA level so that one can consider the possibility that one of the DNA and RNA doublets is modified by an addition of something containing silicon to give an additional doublet.

For  $(4 + 16) \times 4$  code four additional doublets must be present. If some base of DNA suffers a modification, it suffers the modification also if it appears in RNA triplet at the same position, and this in turn implies that also the conjugate of the DNA base suffers modification so that 32 additional triplets are generated. Thus the modified base of DNA cannot appear in RNA and vice versa. DNA bases (A, G, T, C) correspond to RNA bases (U, C, A, G). Since the T of DNA corresponds to the U of RNA, there is only one possibility. The modified base is T for DNA and U for RNA, and the  $T_S$  of DNA must correspond to  $U_S$  of RNA rather than  $A_S$ . The simplest possibility is that the doublets of form XT have doubled by the silicon modification of the second T to  $XT_S$ . Also  $T_S X$  type modification is in principle possible but the construction of the code favors the  $XT_S$  option (in this case code the table gets a fifth column whereas for  $T_S X$  gives rise to a fifth row).

### $2 \times 12$ product model for the small letter plus special symbol code with 80 generalized DNAs and 23 amino-acids

The optimal candidate for the code involving 64+16 generalized DNAs involves 20+3 generalized amino-acids. There are two options corresponding to the decompositions  $24 = 3 \times 8$  and  $24 = 2 \times 12$ . The assumption that small letter plus special sign code follows from the capital letter code as extension favors  $2 \times 12$  option.  $2 \times 12$  option for the small letter + special sign code allows highly unique model since one can assume that the code results as a simple extension of the capital letter code and is obtained by the same symmetry breaking procedure as the capital letter code and terrestrial genetic codes. The discussion below is restricted to OPpose option.

The first step is to deduce the composition in the set of  $4 + 16$  DNA doublets defining the product code. The only working option has the decomposition 11111112235, which corresponds to the decomposition

$$20 \times (2 \oplus 2) = (5 \oplus 3 \oplus 2 \oplus 2 \oplus 8 \times 1) \times (2 \oplus 2) .$$

This gives **Table 8.18** for the degeneracies.

The breaking of the product symmetry looks large but it turns out that the code can be obtained as a relatively small deformation and extension of the capital letter code.

The first things to observe about the code are following.

	A	G	T	C	$T_S$	
A	phe	ser	tyr	scys	.	A
	phe	ser	tyr	scys	.	G
	leu	thr	stop	stop	thr	T
	leu	thr	stop	stop	thr	C
G	val	ala	glu	gly	!	T
	val	ala	glu	gly	!	C
	thr	stop	gln	arg	trp	T
	thr	stop	gln	arg	trp	C
T	ile	ser	asn	ser	.	A
	ile	ser	asn	ser	.	G
	met	thr	plys	arg	&	T
	met	thr	plys	arg	&	C
C	val	ser	asp	scys	ser	A
	val	ser	asp	scys	ser	G
	thr	pro	his	arg	trp	A
	thr	pro	his	arg	trp	G

**Table 8.19:** Small letter special sign product code before flow and T-C symmetry breaking.

1. Comparing the decomposition 11111112235 with the corresponding decomposition 111111234 for the capital letter code, one can guess that the small letter code is obtained from the capital letter code by the following process in the set of 4 exotic RNA-doublets. Decompose the four exotic RNAs to  $(2 \oplus 1 \oplus 1) \times (2 \oplus 2)$  such that  $2 \times (2 \oplus 2)$  codes for exotic and ordinary amino-acid quartet. Since trp is lacking from capital letter code before symmetry breaking, one can assume that trp is the ordinary amino-acid. Since the exotic amino-acid “period” appears five times, the second 4-plet must code for “period”. The two doublets must code for exotic doublets & and ! which reduce to singlets after symmetry breaking. Two exotic doublets fuse with the two octets of the capital letter code to code for two decouplets and must therefore code for the ordinary amino-acids ser and thr. Thus the code table without symmetry breaking looks very much like capital letter code table.
2. The modification  $XT \rightarrow XT_S$  implies that code table gets fifth column. Only this option allows to generalize in non-trivial manner the flow and allows to see trp 4-plets as being consistent with product code.
3. Terrestrial codes contain two exotic amino-acids scys and plys. The fact that the small letter + special sign code contains the symbols  $h$  and  $\backslash$  with ASCII number larger than 64 not appearing in the capital letter code is taken as a suggestion that the corresponding amino-acids are exotic. A natural working hypothesis is cys is replaced with scys and lys with plys. Needless to add, this hypothesis must be taken with a grain of salt.

*1. Product code before flow*

The code table before the action of the flow and T-C symmetry breaking looks like follows. The code table obviously resembles capital letter code table to a very high degree and satisfies all the constraints resulting from the A-G and T-C symmetries and product structure of the code.

*2. The action of the flow*

*3. T-C symmetry breaking*

The basic assumptions are that the G-column of the code is universal for the alien code just as it is universal for the terrestrial codes, and that the code table resembles maximally to our code table and capital letter code table.

	A	G	T	C	$T_S$	
A	phe	ser	tyr	scys	.	A
	phe	ser	tyr	scys	.	G
	leu	ser	stop	stop	thr	T
	leu	ser	stop	stop	thr	C

	thr	pro	his	arg	trp	G
	thr	stop	gln	arg	trp	T
	thr	stop	gln	arg	trp	C
T	ile	thr	asn	ser	.	A
	ile	thr	asn	ser	.	G
	met	thr	plys	arg	&	T
	met	thr	plys	arg	&	C
C	val	ser	asp	scys	ser	A
	val	ser	asp	scys	ser	G
	val	ala	glu	gly	!	T
	val	ala	glu	gly	!	C

**Table 8.20:** Small-letter special sign genetic code after the flow and before T-C symmetry breaking.

1. One must transform the two 10s (thr and ser) to 13 and 9. The clue to the symmetry breaking mechanism comes from the finding that one must be able to generate as many as 10 singlets. Hard trial and error work teaches that one cannot get these singlets unless one allows  $10 + 4 \rightarrow 13 + 1$  mechanism for producing one of the singlets. The transformation of val-val-val-val to ser-ser-ser-val is the only candidate for this transformation and gives  $N(4) = 3$  (scys, period, trp) and  $N(1) = 1$ .

The thr is the second 10-plet and the transformation of TTC-thr to stop is the only possibility if the universality of the G column in alien sector is assumed. The transformation of  $(AC)_2$  stop-stop column to trp-trp implies maximal resemblance with our genetic code, and one obtains  $N(13) = N(9) = 1$  (thr, ser),  $N(6) = 2$  (arg, trp),  $N(5) = 1 < 5$  (stop) and  $N(4) = 2 < 3$  (scys, period).

2. The remaining transformations must produce  $N(1) = 10 > 1$ ,  $N(2) = 4$ ,  $N(4) = 3 > 2$ ,  $N(5) = 2 > 1$ ,  $N(6) = 3 > 2$  by acting on the T-C type doublets only and thus generating a breaking of T-C symmetry. The first step is to replace & in the  $(TT_S)_2$  by “period” to get  $N(5) = 2$ ,  $N(4) = 1$ ,  $N(1) = 2$ . What one must create by the splitting all the remaining T-C doublets so that 2 4-plets and 1 6-plet as extension of A-G type doublets results. The choice of the A-G type doublets is not unique but the requirement that the code table resembles maximally the code table of the capital letter code fixes the choice of A-G type doublets extended to 4-plets to be  $AA_1$  (phe),  $(TT)_1$  (ile) and the A-G type doublet extend to 6-plet to be  $CT_1$  (asp). **Table 8.21** summarizes one possible code table satisfying these constraints. For comparison also the table for capital letter code is given.

### Product model for the small letter code with 20 amino-acids and 80 generalized DNAs

The number theoretical model generalizes for the codes defined by 64 ordinary DNAs + 16 DNAs of form  $XT_S Y$  and assuming that besides 20 amino-acids there are 3 additional modified amino-acids. A small letter-special symbol code with 80 DNAs and 20 amino-acids is obtained from 23-amino-acid code by assuming that the exotic DNAs coding for special signs !, & and period code for stopping sign and the previous construction for  $2 \times 12$  code works as such. Oppose option with 64 DNAs (special signs being not interpreted as belonging to the code) and 18 amino-acids is in conflict with the requirement of a maximal expressive power. My personal conviction is that this option can be safely forgotten.

	A	G	T	C	$T_S$

**Table 8.21:** Small letter special sign genetic code resulting from T-C symmetry breaking. The replacements  $X \rightarrow Y$  tell how the code in the sector of ordinary DNAs is obtained from the capital letter code.

### Why the numbers 64 and 80?

The dark matter hierarchy based on the hierarchy of increasing values of Planck constant predicts that the entire universe is a macroscopic quantum system and elementary particles have a hierarchy of zoomed up variants with arbitrarily large Compton length (proportional to  $\hbar$ ) [K32]. Dark matter should be especially important for living matter and life should therefore involve fundamental physics in an essential manner rather than emerge at some very high level of complexity. Hence one can ask whether the numbers 64 and 80 for the codons of the two codes could reflect basic facts about fundamental physics in TGD Universe. The following numerological argument based on detailed counting of particle states encourages to take this idea half-seriously at least.

1. Gravitons and more general stringy states are not counted since they correspond to bound states of fermions and bosons connected by flux tubes. Color is counted neither since it corresponds to  $CP_2$  partial wave and is not spin like degree of freedom in TGD framework. Family replication phenomenon has a topological explanation and is counted neither. This leaves only spinorial degrees of freedom which according to TGD inspired theory of consciousness are responsible for Boolean representations using fermionic Fock states. The natural guess is that these fermionic degrees of freedom might relate to the genetic code or genetic code might represent them.
2. TGD predicts in purely spinorial degrees of freedom 8 lepton states (lepton and anti-lepton both having 4 states due to spin and electro-weak isospin). Also phase conjugates of these states are predicted so that  $8+8=16$  states are obtained. The number of spinor states is same in the quark sector. This gives  $16+16=32$  states altogether.
3. Bosons are identifiable as tiny wormhole contacts carrying fermion and anti-fermion numbers at the light-like wormhole throats. Essentially lepto-antilepton and quark-antiquark pairs or their superpositions are in question.  $(2 + 1) \times (3 + 1) = 12$  leptonic and 12 quark like bosons with spin and electro-weak isospin equal to 1 or 0 (only two massless spin states are possible). Together with phase conjugates this makes  $24+24= 48$  states. 24 of them correspond to ordinary electro-weak gauge bosons and Higgs and the remaining 24 are exotic bosons with charge matrices orthogonal to the charge matrices of electro-weak gauge bosons. For exotic counterparts of  $W$  bosons and Higgs the sign of the coupling to quarks is opposite.

For photon and  $Z^0$  also the relative magnitudes of the couplings to quarks much change. The total number of bosonic states is 48 and the number of all particle states in this sense is  $48+16+16=80$ . If quarks are dropped from consideration the number is 64.

4. The numerological question is whether the 64 ordinary genetic codons are in some deeper sense in one-one correspondence with 48 color singlet gauge bosons and 16 lepton states and the 80 codons of the extended code in one-one correspondence with all states constructed in this manner.

### 8.4.6 Embedding of the amino-acid space into DNA space and the universal part of the genetic code

The concrete geometric formulation for the symmetries is based on the embedding of 20+1 generalized amino-acids to the space of 64 DNAs. Obviously, the amino-acids are coded by the DNAs to which they are mapped by this embedding. There is indeed an embedding of 20 amino-acids plus stopping sign with  $2 \times 10$  structure to the set of 64 DNA triplets which have  $4 \times 16$  structure. 2 is imbedded into 4 which corresponds to the 4 last bases of DNA and 10 into 16 which corresponds to 16 pairs of first two bases of DNA. The lacking amino-acid is embedded as a kind of outsider for 64 DNA codes. In case of 80 DNA-24 generalized amino-acid code this embedding is replaced with the embedding of 2 amino-acids to 4 and 12 to  $16 + 2$  structure.

This kind of embedding would be regarded in the language of mathematician as a discrete bundle structure which is also singular in the sense that the fiber above a given base point does not always have the same number of points. The  $10 \times 2$  and  $16 \times 4$  compositions suggest the interpretation as the embedding of the space formed by 10 points of 2-D space-time to the space formed by 16 points of 4-D space-time. Analogous interpretation applies also in the case of the extended codes.

The interpretation conforms with the general idea that DNA represents a plan and involves intentionality and time dimension somehow. The amino-acids coded by several DNAs correspond to surfaces for several time values correspond to the same spatial point represented by amino-acid. The set of DNAs coding single amino-acid brings in mind the notion of "association sequence" defined as a disjoint union of space-like 3-surfaces with time-like separations and possible by the classical non-determinism of the Kähler action absolutely crucial for understanding consciousness in TGD framework [K48]. The number of DNAs coding the amino-acid would measure the degree of intentionality involved with it: each DNA associated with the amino-acid would symbolize one step in a plan. Some of alien amino-acids would be highly intentional: the degeneracies can be as high as 13 to be compared to the maximal degeneracy of 6 for our code!

Consider now in more detail this structure.

1. Exact A-G gauge symmetry implies that the pairs (XYA, XYG) form fibers and one can choose freely XYA or XYG to represent the amino-acid. In case of T-C symmetry symmetry breaking can select either XYT or XYC uniquely as a representative of the amino-acid.
2. For amino-acid coded by two DNAs only the identification of the amino-acid is unique apart from the possible gauge symmetry. For  $n > 2$ -plets the identification involves non-uniqueness.
3. The requirement that the embedding of amino-acids to DNA space is universal allows to fix identification uniquely in case of  $n > 2$ -plets. It turns out that one can assume universal embedding to make sense for both terrestrial and alien codes (if the replacements  $cys \rightarrow scys$  and  $lys \rightarrow plys$  possibly occurring for the small letter + special sign code are appropriately interpreted). This assumption fixes the embedding highly uniquely and the only uncertainties relate to the T-C symmetry breaking. The possibility to choose the universal part of the code table to be the same for all codes, suggests that the proposed model catches something essential. It is also difficult to imagine that a randomly generated ASCII message could allow interpretation in terms of genetic codes having so high symmetry properties and common construction principles. **Table 8.22** summarizes the universal part of the genetic code resulting from the embedding of the amino-acid space to DNA space. Also small letter code is included.

	A	G	T	C	$T_S$	
A	phe	ser	tyr	cys (scys)	.	A
						G
						T
	leu		stop	trp		C
G		pro	his	arg		A
						G
						T
			gln			C
T	ile	thr	asn			A
						G
						T
	met	thr	lys (plys)		&	C
C			asp			A
						G
						T
	val	ala	glu	gly	!	C

**Table 8.22:** A possible embedding of the amino-acid space to the DNA space. The gauge choice XYA allowed by A-G gauge invariance of the last codon is made. The identification is same for both our code, capital letter code, and small letter plus special sign code. There is some uncertainty related to the T-C symmetry breaking.

### 8.4.7 Summary

To sum up, both the terrestrial and hypothetical alien genetic codes can be constructed from the A-G and T-C symmetric product codes by assuming a breaking of both product- and T-C symmetries. Product structure and symmetries suggests strongly that genetic codes have evolved as a fusion of much simpler doublet and singlet codes. Hydrophilic-hydrophobic dichotomy is a good candidate for the dichotomy implied by the  $2 \times 10$  product structure. The assumption that the breaking of the product symmetry induced by the “volume preserving flow” in DNA space tending to cluster amino-acids in the vertical direction of the code table is universal, and the hypothesis that the embedding of the amino-acid space to the DNA space is universal, together fix the identification of the codes highly uniquely.

The small letter-special symbol code with 80 DNAs and 23 amino-acids is favored because it maximizes both the information content and the expressive power of the code. The degenerate code with 80 DNAs and 20 amino-acids is obtained from the 23-amino-acid code by assuming that the exotic DNAs coding for special signs !, & and period code for stopping sign. To my own opinion the OPpose option for the small letter code with 80 DNAs and 23 amino-acids is the most plausible alternative.

### Acknowledgements

I want to express my gratitude for several persons. In particular, for Tapani Koivula for encouraging me to take seriously UFOs and ETs and for interesting suggestions (in particular, for stimulating the idea that tectonic energy could serve as a “food” of plasmoid like life forms), Martin Keitel for helping me to realize that crop circles are real and telling about the Chilbolton and Crabwood crop circles as well as for concrete help, and for Toni Siira for providing material related to UFOs and for interesting email exchanges. I want also to thank for Jukka Kinnunen for two champaign bottles (the first one for the capital letter code and the second one for the small letter code): I hope that I will sooner or later invent the means of establishing communications with aliens (the third bottle of champaign). I would also want to thank the ITs responsible for these charming Chilbolton and Crabwood crop formations. If I only knew their names! As an underground intellectual myself, I hope that amplitude modulated micro-waves or whatever from my computer could mediate my deep gratitude and warm greetings to this underground

intelligentsia.

# Chapter i

## Appendix

### A-1 Introduction

Originally this appendix was meant to be a purely technical summary of basic facts but in its recent form it tries to briefly summarize those basic visions about TGD which I dare to regard as stabilized. I have added illustrations making it easier to build mental images about what is involved and represented briefly the key arguments. This chapter is hoped to help the reader to get fast grasp about the concepts of TGD.

The basic properties of embedding space and related spaces are discussed and the relationship of  $CP_2$  to the standard model is summarized. The basic vision is simple: the geometry of the embedding space  $H = M^4 \times CP_2$  geometrizes standard model symmetries and quantum numbers. The assumption that space-time surfaces are basic objects, brings in dynamics as dynamics of 3-D surfaces based on the induced geometry. Second quantization of free spinor fields of  $H$  induces quantization at the level of  $H$ , which means a dramatic simplification.

The notions of induction of metric and spinor connection, and of spinor structure are discussed. Many-sheeted space-time and related notions such as topological field quantization and the relationship many-sheeted space-time to that of GRT space-time are discussed as well as the recent view about induced spinor fields and the emergence of fermionic strings. Also the relationship to string models is discussed briefly.

Various topics related to p-adic numbers are summarized with a brief definition of p-adic manifold and the idea about generalization of the number concept by gluing real and p-adic number fields to a larger book like structure analogous to adèle [L11, L12]. In the recent view of quantum TGD [L52], both notions reduce to physics as number theory vision, which relies on  $M^8 - H$  duality [L29, L30] and is complementary to the physics as geometry vision.

Zero energy ontology (ZEO) [L28] [K100] has become a central part of quantum TGD and leads to a TGD inspired theory of consciousness as a generalization of quantum measurement theory having quantum biology as an application. Also these aspects of TGD are briefly discussed.

### A-2 Embedding space $M^4 \times CP_2$

Space-times are regarded as 4-surfaces in  $H = M^4 \times CP_2$  the Cartesian product of empty Minkowski space - the space-time of special relativity - and compact 4-D space  $CP_2$  with size scale of order  $10^4$  Planck lengths. One can say that embedding space is obtained by replacing each point  $m$  of empty Minkowski space with 4-D tiny  $CP_2$ . The space-time of general relativity is replaced by a 4-D surface in  $H$  which has very complex topology. The notion of many-sheeted space-time gives an idea about what is involved.

**Fig. 1.** Embedding space  $H = M^4 \times CP_2$  as Cartesian product of Minkowski space  $M^4$  and complex projective space  $CP_2$ . <http://tgdtheory.fi/appfigures/Hoo.jpg>

Denote by  $M_+^4$  and  $M_-^4$  the future and past directed lightcones of  $M^4$ . Denote their intersection, which is not unique, by CD. In zero energy ontology (ZEO) [L28, L38] [K100] causal diamond

(CD) is defined as cartesian product  $CD \times CP_2$ . Often I use CD to refer just to  $CD \times CP_2$  since  $CP_2$  factor is relevant from the point of view of ZEO.

**Fig. 2.** Future and past light-cones  $M_+^4$  and  $M_-^4$ . Causal diamonds (CD) are defined as their intersections. <http://tgdtheory.fi/appfigures/futurepast.jpg>

**Fig. 3.** Causal diamond (CD) is highly analogous to Penrose diagram but simpler. <http://tgdtheory.fi/appfigures/penrose.jpg>

A rather recent discovery was that  $CP_2$  is the only compact 4-manifold with Euclidian signature of metric allowing twistor space with Kähler structure.  $M^4$  is in turn is the only 4-D space with Minkowskian signature of metric allowing twistor space with Kähler structure [A12] so that  $H = M^4 \times CP_2$  is twistorially unique.

One can loosely say that quantum states in a given sector of “world of classical worlds” (WCW) are superpositions of space-time surfaces inside CDs and that positive and negative energy parts of zero energy states are localized and past and future boundaries of CDs. CDs form a hierarchy. One can have CDs within CDs and CDs can also overlap. The size of CD is characterized by the proper time distance between its two tips. One can perform both translations and also Lorentz boosts of CD leaving either boundary invariant. Therefore one can assign to CDs a moduli space and speak about wave function in this moduli space.

In number theoretic approach it is natural to restrict the allowed Lorentz boosts to some discrete subgroup of Lorentz group and also the distances between the tips of CDs to multiples of  $CP_2$  radius defined by the length of its geodesic. Therefore the moduli space of CDs discretizes. The quantization of cosmic recession velocities for which there are indications, could relate to this quantization.

### A-2.1 Basic facts about $CP_2$

$CP_2$  as a four-manifold is very special. The following arguments demonstrate that it codes for the symmetries of standard models via its isometries and holonomies.

#### $CP_2$ as a manifold

$CP_2$ , the complex projective space of two complex dimensions, is obtained by identifying the points of complex 3-space  $C^3$  under the projective equivalence

$$(z^1, z^2, z^3) \equiv \lambda(z^1, z^2, z^3) . \quad (\text{A-2.1})$$

Here  $\lambda$  is any non-zero complex number. Note that  $CP_2$  can be also regarded as the coset space  $SU(3)/U(2)$ . The pair  $z^i/z^j$  for fixed  $j$  and  $z^i \neq 0$  defines a complex coordinate chart for  $CP_2$ . As  $j$  runs from 1 to 3 one obtains an atlas of three coordinate charts covering  $CP_2$ , the charts being holomorphically related to each other (e.g.  $CP_2$  is a complex manifold). The points  $z^3 \neq 0$  form a subset of  $CP_2$  homeomorphic to  $R^4$  and the points with  $z^3 = 0$  a set homeomorphic to  $S^2$ . Therefore  $CP_2$  is obtained by “adding the 2-sphere at infinity to  $R^4$ ”.

Besides the standard complex coordinates  $\xi^i = z^i/z^3$ ,  $i = 1, 2$  the coordinates of Eguchi and Freund [A7] will be used and their relation to the complex coordinates is given by

$$\begin{aligned} \xi^1 &= z + it , \\ \xi^2 &= x + iy . \end{aligned} \quad (\text{A-2.2})$$

These are related to the “spherical coordinates” via the equations

$$\begin{aligned} \xi^1 &= r \exp(i \frac{\Psi + \Phi}{2}) \cos(\frac{\Theta}{2}) , \\ \xi^2 &= r \exp(i \frac{\Psi - \Phi}{2}) \sin(\frac{\Theta}{2}) . \end{aligned} \quad (\text{A-2.3})$$

The ranges of the variables  $r, \Theta, \Phi, \Psi$  are  $[0, \infty], [0, \pi], [0, 4\pi], [0, 2\pi]$  respectively.

Considered as a real four-manifold  $CP_2$  is compact and simply connected, with Euler number 3, Pontryagin number 3 and second  $b = 1$ .

Fig. 4.  $CP_2$  as manifold. <http://tgdtheory.fi/appfigures/cp2.jpg>

### Metric and Kähler structure of $CP_2$

In order to obtain a natural metric for  $CP_2$ , observe that  $CP_2$  can be thought of as a set of the orbits of the isometries  $z^i \rightarrow \exp(i\alpha)z^i$  on the sphere  $S^5$ :  $\sum z^i \bar{z}^i = R^2$ . The metric of  $CP_2$  is obtained by projecting the metric of  $S^5$  orthogonally to the orbits of the isometries. Therefore the distance between the points of  $CP_2$  is that between the representative orbits on  $S^5$ .

The line element has the following form in the complex coordinates

$$ds^2 = g_{a\bar{b}} d\xi^a d\bar{\xi}^b, \tag{A-2.4}$$

where the Hermitian, in fact Kähler metric  $g_{a\bar{b}}$  is defined by

$$g_{a\bar{b}} = R^2 \partial_a \partial_{\bar{b}} K, \tag{A-2.5}$$

where the function  $K$ , Kähler function, is defined as

$$\begin{aligned} K &= \log(F), \\ F &= 1 + r^2. \end{aligned} \tag{A-2.6}$$

The Kähler function for  $S^2$  has the same form. It gives the  $S^2$  metric  $dzd\bar{z}/(1+r^2)^2$  related to its standard form in spherical coordinates by the coordinate transformation  $(r, \phi) = (\tan(\theta/2), \phi)$ .

The representation of the  $CP_2$  metric is deducible from  $S^5$  metric is obtained by putting the angle coordinate of a geodesic sphere constant in it and is given

$$\frac{ds^2}{R^2} = \frac{(dr^2 + r^2 \sigma_3^2)}{F^2} + \frac{r^2(\sigma_1^2 + \sigma_2^2)}{F}, \tag{A-2.7}$$

where the quantities  $\sigma_i$  are defined as

$$\begin{aligned} r^2 \sigma_1 &= \text{Im}(\xi^1 d\xi^2 - \xi^2 d\xi^1), \\ r^2 \sigma_2 &= -\text{Re}(\xi^1 d\xi^2 - \xi^2 d\xi^1), \\ r^2 \sigma_3 &= -\text{Im}(\xi^1 d\bar{\xi}^1 + \xi^2 d\bar{\xi}^2). \end{aligned} \tag{A-2.8}$$

$R$  denotes the radius of the geodesic circle of  $CP_2$ . The vierbein forms, which satisfy the defining relation

$$s_{kl} = R^2 \sum_A e_k^A e_l^A, \tag{A-2.9}$$

are given by

$$\begin{aligned} e^0 &= \frac{dr}{F}, & e^1 &= \frac{r\sigma_1}{\sqrt{F}}, \\ e^2 &= \frac{r\sigma_2}{\sqrt{F}}, & e^3 &= \frac{r\sigma_3}{F}. \end{aligned} \tag{A-2.10}$$

The explicit representations of vierbein vectors are given by

$$\begin{aligned}
e^0 &= \frac{dr}{F} , & e^1 &= \frac{r(\sin\Theta\cos\Psi d\Phi + \sin\Psi d\Theta)}{2\sqrt{F}} , \\
e^2 &= \frac{r(\sin\Theta\sin\Psi d\Phi - \cos\Psi d\Theta)}{2\sqrt{F}} , & e^3 &= \frac{r(d\Psi + \cos\Theta d\Phi)}{2F} .
\end{aligned}
\tag{A-2.11}$$

The explicit representation of the line element is given by the expression

$$ds^2/R^2 = \frac{dr^2}{F^2} + \frac{r^2}{4F^2}(d\Psi + \cos\Theta d\Phi)^2 + \frac{r^2}{4F}(d\Theta^2 + \sin^2\Theta d\Phi^2) .
\tag{A-2.12}$$

From this expression one finds that at coordinate infinity  $r = \infty$  line element reduces to  $\frac{r^2}{4F}(d\Theta^2 + \sin^2\Theta d\Phi^2)$  of  $S^2$  meaning that 3-sphere degenerates metrically to 2-sphere and one can say that  $CP_2$  is obtained by adding to  $R^4$  a 2-sphere at infinity.

The vierbein connection satisfying the defining relation

$$de^A = -V_B^A \wedge e^B ,
\tag{A-2.13}$$

is given by

$$\begin{aligned}
V_{01} &= -\frac{e^1}{r_2} , & V_{23} &= \frac{e^1}{r_2} , \\
V_{02} &= -\frac{e^2}{r} , & V_{31} &= \frac{e^2}{r} , \\
V_{03} &= (r - \frac{1}{r})e^3 , & V_{12} &= (2r + \frac{1}{r})e^3 .
\end{aligned}
\tag{A-2.14}$$

The representation of the covariantly constant curvature tensor is given by

$$\begin{aligned}
R_{01} &= e^0 \wedge e^1 - e^2 \wedge e^3 , & R_{23} &= e^0 \wedge e^1 - e^2 \wedge e^3 , \\
R_{02} &= e^0 \wedge e^2 - e^3 \wedge e^1 , & R_{31} &= -e^0 \wedge e^2 + e^3 \wedge e^1 , \\
R_{03} &= 4e^0 \wedge e^3 + 2e^1 \wedge e^2 , & R_{12} &= 2e^0 \wedge e^3 + 4e^1 \wedge e^2 .
\end{aligned}
\tag{A-2.15}$$

Metric defines a real, covariantly constant, and therefore closed 2-form  $J$

$$J = -is_{a\bar{b}}d\xi^a d\bar{\xi}^b ,
\tag{A-2.16}$$

the so called Kähler form. Kähler form  $J$  defines in  $CP_2$  a symplectic structure because it satisfies the condition

$$J_r^k J^{rl} = -s^{kl} .
\tag{A-2.17}$$

The condition states that  $J$  and  $g$  give representations of real unit and imaginary units related by the formula  $i^2 = -1$ .

Kähler form is expressible locally in terms of Kähler gauge potential

$$J = dB ,
\tag{A-2.18}$$

where  $B$  is the so called Kähler potential, which is not defined globally since  $J$  describes homological magnetic monopole.

$dJ = ddB = 0$  gives the topological half of Maxwell equations (vanishing of magnetic charges and Faraday's induction law) and self-duality  $*J = J$  reduces the remaining equations to  $dJ = 0$ . Hence the Kähler form can be regarded as a curvature form of a  $U(1)$  gauge potential  $B$  carrying a magnetic charge of unit  $1/2g$  ( $g$  denotes the gauge coupling).

The magnetic flux of  $J$  through a 2-surface in  $CP_2$  is proportional to its homology equivalence class, which is integer valued. The explicit representations of  $J$  and  $B$  are given by

$$\begin{aligned}
 B &= 2re^3 , \\
 J &= 2(e^0 \wedge e^3 + e^1 \wedge e^2) = \frac{r}{F^2} dr \wedge (d\Psi + \cos\Theta d\Phi) + \frac{r^2}{2F} \sin\Theta d\Theta \wedge d\Phi .
 \end{aligned}
 \tag{A-2.19}$$

The vierbein curvature form and Kähler form are covariantly constant and have in the complex coordinates only components of type (1, 1).

Useful coordinates for  $CP_2$  are the so called canonical (or symplectic or Darboux) coordinates in which the Kähler potential and Kähler form have very simple expressions

$$\begin{aligned}
 B &= \sum_{k=1,2} P_k dQ_k , \\
 J &= \sum_{k=1,2} dP_k \wedge dQ_k .
 \end{aligned}
 \tag{A-2.20}$$

The relationship of the canonical coordinates to the “spherical” coordinates is given by the equations

$$\begin{aligned}
 P_1 &= -\frac{1}{1+r^2} , \\
 P_2 &= -\frac{r^2 \cos\Theta}{2(1+r^2)} , \\
 Q_1 &= \Psi , \\
 Q_2 &= \Phi .
 \end{aligned}
 \tag{A-2.21}$$

**Spinors In  $CP_2$**

$CP_2$  doesn't allow spinor structure in the conventional sense [A5]. However, the coupling of the spinors to a half odd multiple of the Kähler potential leads to a respectable spinor structure. Because the delicacies associated with the spinor structure of  $CP_2$  play a fundamental role in TGD, the arguments of Hawking are repeated here.

To see how the space can fail to have an ordinary spinor structure consider the parallel transport of the vierbein in a simply connected space  $M$ . The parallel propagation around a closed curve with a base point  $x$  leads to a rotated vierbein at  $x$ :  $e^A = R_B^A e^B$  and one can associate to each closed path an element of  $SO(4)$ .

Consider now a one-parameter family of closed curves  $\gamma(v) : v \in (0, 1)$  with the same base point  $x$  and  $\gamma(0)$  and  $\gamma(1)$  trivial paths. Clearly these paths define a sphere  $S^2$  in  $M$  and the element  $R_B^A(v)$  defines a closed path in  $SO(4)$ . When the sphere  $S^2$  is contractible to a point e.g., homologically trivial, the path in  $SO(4)$  is also contractible to a point and therefore represents a trivial element of the homotopy group  $\Pi_1(SO(4)) = Z_2$ .

For a homologically nontrivial 2-surface  $S^2$  the associated path in  $SO(4)$  can be homotopically nontrivial and therefore corresponds to a nonclosed path in the covering group  $Spin(4)$  (leading from the matrix 1 to -1 in the matrix representation). Assume this is the case.

Assume now that the space allows spinor structure. Then one can parallel propagate also spinors and by the above construction associate a closed path of  $Spin(4)$  to the surface  $S^2$ . Now, however this path corresponds to a lift of the corresponding  $SO(4)$  path and cannot be closed. Thus one ends up with a contradiction.

From the preceding argument it is clear that one could compensate the non-allowed  $-1$ -factor associated with the parallel transport of the spinor around the sphere  $S^2$  by coupling it to a gauge potential in such a way that in the parallel transport the gauge potential introduces a compensating  $-1$ -factor. For a  $U(1)$  gauge potential this factor is given by the exponential

$\exp(i2\Phi)$ , where  $\Phi$  is the magnetic flux through the surface. This factor has the value  $-1$  provided the  $U(1)$  potential carries half odd multiple of Dirac charge  $1/2g$ . In case of  $CP_2$  the required gauge potential is half odd multiple of the Kähler potential  $B$  defined previously. In the case of  $M^4 \times CP_2$  one can in addition couple the spinor components with different chiralities independently to an odd multiple of  $B/2$ .

### Geodesic sub-manifolds of $CP_2$

Geodesic sub-manifolds are defined as sub-manifolds having common geodesic lines with the embedding space. As a consequence the second fundamental form of the geodesic manifold vanishes, which means that the tangent vectors  $h_\alpha^k$  (understood as vectors of  $H$ ) are covariantly constant quantities with respect to the covariant derivative taking into account that the tangent vectors are vectors both with respect to  $H$  and  $X^4$ .

In [A16] a general characterization of the geodesic sub-manifolds for an arbitrary symmetric space  $G/H$  is given. Geodesic sub-manifolds are in 1-1-correspondence with the so called Lie triple systems of the Lie-algebra  $g$  of the group  $G$ . The Lie triple system  $t$  is defined as a subspace of  $g$  characterized by the closedness property with respect to double commutation

$$[X, [Y, Z]] \in t \text{ for } X, Y, Z \in t . \quad (\text{A-2.22})$$

$SU(3)$  allows, besides geodesic lines, two nonequivalent (not isometry related) geodesic spheres. This is understood by observing that  $SU(3)$  allows two nonequivalent  $SU(2)$  algebras corresponding to subgroups  $SO(3)$  (orthogonal  $3 \times 3$  matrices) and the usual isospin group  $SU(2)$ . By taking any subset of two generators from these algebras, one obtains a Lie triple system and by exponentiating this system, one obtains a 2-dimensional geodesic sub-manifold of  $CP_2$ .

Standard representatives for the geodesic spheres of  $CP_2$  are given by the equations

$$S_I^2 : \xi^1 = \bar{\xi}^2 \text{ or equivalently } (\Theta = \pi/2, \Psi = 0) ,$$

$$S_{II}^2 : \xi^1 = \xi^2 \text{ or equivalently } (\Theta = \pi/2, \Phi = 0) .$$

The non-equivalence of these sub-manifolds is clear from the fact that isometries act as holomorphic transformations in  $CP_2$ . The vanishing of the second fundamental form is also easy to verify. The first geodesic manifold is homologically trivial: in fact, the induced Kähler form vanishes identically for  $S_I^2$ .  $S_{II}^2$  is homologically nontrivial and the flux of the Kähler form gives its homology equivalence class.

## A-2.2 $CP_2$ geometry and Standard Model symmetries

### Identification of the electro-weak couplings

The delicacies of the spinor structure of  $CP_2$  make it a unique candidate for space  $S$ . First, the coupling of the spinors to the  $U(1)$  gauge potential defined by the Kähler structure provides the missing  $U(1)$  factor in the gauge group. Secondly, it is possible to couple different  $H$ -chiralities independently to a half odd multiple of the Kähler potential. Thus the hopes of obtaining a correct spectrum for the electromagnetic charge are considerable. In the following it will be demonstrated that the couplings of the induced spinor connection are indeed those of the GWS model [B9] and in particular that the right handed neutrinos decouple completely from the electro-weak interactions.

To begin with, recall that the space  $H$  allows to define three different chiralities for spinors. Spinors with fixed  $H$ -chirality  $e = \pm 1$ ,  $CP_2$ -chirality  $l, r$  and  $M^4$ -chirality  $L, R$  are defined by the condition

$$\begin{aligned} \Gamma\Psi &= e\Psi , \\ e &= \pm 1 , \end{aligned} \quad (\text{A-2.23})$$

where  $\Gamma$  denotes the matrix  $\Gamma_9 = \gamma_5 \otimes \gamma_5$ ,  $1 \otimes \gamma_5$  and  $\gamma_5 \otimes 1$  respectively. Clearly, for a fixed  $H$ -chirality  $CP_2$ - and  $M^4$ -chiralities are correlated.

The spinors with  $H$ -chirality  $e = \pm 1$  can be identified as quark and lepton like spinors respectively. The separate conservation of baryon and lepton numbers can be understood as a consequence of generalized chiral invariance if this identification is accepted. For the spinors with a definite  $H$ -chirality one can identify the vielbein group of  $CP_2$  as the electro-weak group:  $SO(4)$  having as its covering group  $SU(2)_L \times SU(2)_R$ .

The covariant derivatives are defined by the spinorial connection

$$A = V + \frac{B}{2}(n_+ 1_+ + n_- 1_-) . \quad (\text{A-2.24})$$

Here  $V$  and  $B$  denote the projections of the vielbein and Kähler gauge potentials respectively and  $1_{+(-)}$  projects to the spinor  $H$ -chirality  $+(-)$ . The integers  $n_{\pm}$  are odd from the requirement of a respectable spinor structure.

The explicit representation of the vielbein connection  $V$  and of  $B$  are given by the equations

$$\begin{aligned} V_{01} &= -\frac{e^1}{r_2} , & V_{23} &= \frac{e^1}{r_2} , \\ V_{02} &= -\frac{e^2}{r} , & V_{31} &= \frac{e^2}{r} , \\ V_{03} &= (r - \frac{1}{r})e^3 , & V_{12} &= (2r + \frac{1}{r})e^3 , \end{aligned} \quad (\text{A-2.25})$$

and

$$B = 2re^3 , \quad (\text{A-2.26})$$

respectively. The explicit representation of the vielbein is not needed here.

Let us first show that the charged part of the spinor connection couples purely left handedly. Identifying  $\Sigma_3^0$  and  $\Sigma_2^1$  as the diagonal (neutral) Lie-algebra generators of  $SO(4)$ , one finds that the charged part of the spinor connection is given by

$$A_{ch} = 2V_{23}I_L^1 + 2V_{13}I_L^2 , \quad (\text{A-2.27})$$

where one have defined

$$\begin{aligned} I_L^1 &= \frac{(\Sigma_{01} - \Sigma_{23})}{2} , \\ I_L^2 &= \frac{(\Sigma_{02} - \Sigma_{13})}{2} . \end{aligned} \quad (\text{A-2.28})$$

$A_{ch}$  is clearly left handed so that one can perform the identification of the gauge potential as

$$W^{\pm} = \frac{2(e^1 \pm ie^2)}{r} , \quad (\text{A-2.29})$$

where  $W^{\pm}$  denotes the charged intermediate vector boson.

The covariantly constant curvature tensor is given by

$$\begin{aligned} R_{01} &= -R_{23} = e^0 \wedge e^1 - e^2 \wedge e^3 , \\ R_{02} &= -R_{31} = e^0 \wedge e^2 - e^3 \wedge e^1 , \\ R_{03} &= 4e^0 \wedge e^3 + 2e^1 \wedge e^2 , \\ R_{12} &= 2e^0 \wedge e^3 + 4e^1 \wedge e^2 . \end{aligned} \quad (\text{A-2.30})$$

The charged part of the curvature tensor is left handed.

This is to be compared with the Weyl tensor, which defines a representation of quaternionic imaginary units.

$$\begin{aligned}
W_{03} = W_{12} &\equiv 2I_3 = 2(e^0 \wedge e^3 + e^1 \wedge e^2) , \\
W_{01} = W_{23} &\equiv I_1 = -e^0 \wedge e^1 - e^2 \wedge e^3 , \\
W_{02} = W_{31} &\equiv I_2 = -e^0 \wedge e^2 - e^3 \wedge e^1 .
\end{aligned} \tag{A-2.31}$$

The charged part of the Weyl tensor is right-handed and that the relative sign of the two terms in the curvature tensor and Weyl tensor are opposite.

Consider next the identification of the neutral gauge bosons  $\gamma$  and  $Z^0$  as appropriate linear combinations of the two functionally independent quantities

$$\begin{aligned}
X &= r e^3 , \\
Y &= \frac{e^3}{r} ,
\end{aligned} \tag{A-2.32}$$

appearing in the neutral part of the spinor connection. We show first that the mere requirement that photon couples vectorially implies the basic coupling structure of the GWS model leaving only the value of Weinberg angle undetermined.

To begin with let us define

$$\begin{aligned}
\bar{\gamma} &= aX + bY , \\
\bar{Z}^0 &= cX + dY ,
\end{aligned} \tag{A-2.33}$$

where the normalization condition

$$ad - bc = 1 ,$$

is satisfied. The physical fields  $\gamma$  and  $Z^0$  are related to  $\bar{\gamma}$  and  $\bar{Z}^0$  by simple normalization factors.

Expressing the neutral part of the spinor connection in term of these fields one obtains

$$\begin{aligned}
A_{nc} &= [(c + d)2\Sigma_{03} + (2d - c)2\Sigma_{12} + d(n_{+1+} + n_{-1-})]\bar{\gamma} \\
&+ [(a - b)2\Sigma_{03} + (a - 2b)2\Sigma_{12} - b(n_{+1+} + n_{-1-})]\bar{Z}^0 .
\end{aligned} \tag{A-2.34}$$

Identifying  $\Sigma_{12}$  and  $\Sigma_{03} = 1 \times \gamma_5 \Sigma_{12}$  as vectorial and axial Lie-algebra generators, respectively, the requirement that  $\gamma$  couples vectorially leads to the condition

$$c = -d . \tag{A-2.35}$$

Using this result plus previous equations, one obtains for the neutral part of the connection the expression

$$A_{nc} = \gamma Q_{em} + Z^0 (I_L^3 - \sin^2 \theta_W Q_{em}) . \tag{A-2.36}$$

Here the electromagnetic charge  $Q_{em}$  and the weak isospin are defined by

$$\begin{aligned}
Q_{em} &= \Sigma^{12} + \frac{(n_{+1+} + n_{-1-})}{6} , \\
I_L^3 &= \frac{(\Sigma^{12} - \Sigma^{03})}{2} .
\end{aligned} \tag{A-2.37}$$

The fields  $\gamma$  and  $Z^0$  are defined via the relations

$$\begin{aligned}
\gamma &= 6d\bar{\gamma} = \frac{6}{(a+b)}(aX + bY) , \\
Z^0 &= 4(a+b)\bar{Z}^0 = 4(X - Y) .
\end{aligned} \tag{A-2.38}$$

The value of the Weinberg angle is given by

$$\sin^2 \theta_W = \frac{3b}{2(a+b)} , \quad (\text{A-2.39})$$

and is not fixed completely. Observe that right handed neutrinos decouple completely from the electro-weak interactions.

The determination of the value of the Weinberg angle is a dynamical problem. The original approach was based on the assumption that it makes sense to talk about electroweak action defined at fundamental level and introduce a symmetry breaking by adding an additional term proportional to Kähler action. The recent view is that Kähler action plus volume term defines the fundamental action.

The Weinberg angle is completely fixed if one requires that the electroweak action contains no cross term of type  $\gamma Z^0$ . This leads to a definite value for the Weinberg angle.

One can however add a symmetry breaking term proportional to Kähler action and this changes the value of the Weinberg angle. As a matter fact, color gauge action identifying color gauge field as proportional to  $H^A J_{\alpha\beta}$  is proportional to Kähler action. A possible interpretation would be as a sum of electroweak and color gauge interactions.

To evaluate the value of the Weinberg angle one can express the neutral part  $F_{nc}$  of the induced gauge field as

$$F_{nc} = 2R_{03}\Sigma^{03} + 2R_{12}\Sigma^{12} + J(n_+1_+ + n_-1_-) , \quad (\text{A-2.40})$$

where one has

$$\begin{aligned} R_{03} &= 2(2e^0 \wedge e^3 + e^1 \wedge e^2) , \\ R_{12} &= 2(e^0 \wedge e^3 + 2e^1 \wedge e^2) , \\ J &= 2(e^0 \wedge e^3 + e^1 \wedge e^2) , \end{aligned} \quad (\text{A-2.41})$$

in terms of the fields  $\gamma$  and  $Z^0$  (photon and  $Z$ - boson)

$$F_{nc} = \gamma Q_{em} + Z^0(I_L^3 - \sin^2 \theta_W Q_{em}) . \quad (\text{A-2.42})$$

Evaluating the expressions above, one obtains for  $\gamma$  and  $Z^0$  the expressions

$$\begin{aligned} \gamma &= 3J - \sin^2 \theta_W R_{12} , \\ Z^0 &= 2R_{03} . \end{aligned} \quad (\text{A-2.43})$$

For the Kähler field one obtains

$$J = \frac{1}{3}(\gamma + \sin^2 \theta_W Z^0) . \quad (\text{A-2.44})$$

Expressing the neutral part of the symmetry broken YM action

$$\begin{aligned} L_{ew} &= L_{sym} + f J^{\alpha\beta} J_{\alpha\beta} , \\ L_{sym} &= \frac{1}{4g^2} \text{Tr}(F^{\alpha\beta} F_{\alpha\beta}) , \end{aligned} \quad (\text{A-2.45})$$

where the trace is taken in spinor representation, in terms of  $\gamma$  and  $Z^0$  one obtains for the coefficient  $X$  of the  $\gamma Z^0$  cross term (this coefficient must vanish) the expression

$$\begin{aligned}
X &= -\frac{K}{2g^2} + \frac{fp}{18} , \\
K &= \text{Tr} [Q_{em}(I_L^3 - \sin^2\theta_W Q_{em})] ,
\end{aligned}
\tag{A-2.46}$$

This parameter can be calculated by substituting the values of quark and lepton charges and weak isospins.

In the general case the value of the coefficient  $K$  is given by

$$K = \sum_i \left[ -\frac{(18 + 2n_i^2)\sin^2\theta_W}{9} \right] ,
\tag{A-2.47}$$

where the sum is over the spinor chiralities, which appear as elementary fermions and  $n_i$  is the integer describing the coupling of the spinor field to the Kähler potential. The cross term vanishes provided the value of the Weinberg angle is given by

$$\sin^2\theta_W = \frac{9 \sum_i 1}{(fg^2 + 2 \sum_i (18 + n_i^2))} .
\tag{A-2.48}$$

In the scenario where both leptons and quarks are elementary fermions the value of the Weinberg angle is given by

$$\sin^2\theta_W = \frac{9}{(\frac{fg^2}{2} + 28)} .
\tag{A-2.49}$$

The bare value of the Weinberg angle is  $9/28$  in this scenario, which is not far from the typical value  $9/24$  of GUTs at high energies [B1]. The experimental value at the scale length scale of the electron can be deduced from the ratio of W and Z boson masses as  $\sin^2\theta_W = 1 - (m_W/m_Z)^2 \simeq .22290$ . This ratio and also the weak boson masses depend on the length scale.

If one interprets the additional term proportional to  $J$  as color action, one could perhaps interpret the value of Weinberg angle as expressing a connection between strong and weak coupling constant evolution. The limit  $f \rightarrow 0$  should correspond to an infinite value of color coupling strength and at this limit one would have  $\sin^2\theta_W = \frac{9}{28}$  for  $f/g^2 \rightarrow 0$ . This does not make sense since the Weinberg angle is in the standard model much smaller in QCD scale  $\Lambda$  corresponding roughly to pion mass scale. The Weinberg angle is in principle predicted by the p-adic coupling constant evolution fixed by the number theoretical vision of TGD.

One could however have a sum of electroweak action, correction terms changing the value of Weinberg angle, and color action and coupling constant evolution could be understood in terms of the coupling parameters involved.

### Electroweak symmetry breaking

One of the hardest challenges in the development of the TGD based view of weak symmetry breaking was the fact that classical field equations allow space-time surfaces with finite but arbitrarily large size. For a fixed space-time surface, the induced gauge fields, including classical weak fields, are long ranged. On the other hand, the large mass for weak bosons would require a short correlation length. How can one understand this together with the fact that a photon has a long correlation length?

In zero energy ontology quantum states are superpositions of space-time surfaces as analogs of almost unique Bohr orbits of particles identified as 3-D surfaces. For some reason the superposition should be such that the quantum averages of weak gauge boson fields vanish below the weak scale whereas the quantum average of electromagnetic fields is non-vanishing.

This is indeed the case.

1. The supersymplectic symmetries form isometries of the world of classical worlds (WCW) and they act in  $CP_2$  degrees of freedom as symplectic transformations leaving the  $CP_2$  symplectic form  $J$  invariant and therefore also its contribution to the electromagnetic field since this part is the same for all space-time surfaces in the superposition of space-time surfaces as a representation of supersymplectic isometry group (as a special case a representation of color group).
2. In TGD, color and electroweak symmetries acting as holonomies are not independent and for the  $SU(2)_L$  part of induced spinor connection the symplectic transformations induces  $SU(2)_L \times U(1)_R$  gauge transformation. This suggests that the quantum expectations of the induced weak fields over the space-time surfaces vanish above the quantum coherence scale. The averages of  $W$  and of the left handed part of  $Z^0$  should therefore vanish.
3.  $\langle Z^0 \rangle$  should vanish. For  $U(1)_R$  part of  $Z^0$ , the action of gauge transformation is trivial in gauge theory. Now however the space-time surface changes under symplectic transformations and this could make the average of the right-handed part of  $Z^0$  vanishing. The vanishing of the average of the axial part of the  $Z^0$  is suggested by the partially conserved axial current hypothesis.

One can formulate this picture quantitatively.

1. The electromagnetic field [L69] contains, besides the induced Kähler form, also the induced curvature form  $R_{12}$ , which couples vectorially. Conserved vector current hypothesis suggests that the average of  $R_{12}$  is non-vanishing. One can express the neutral part of the induced gauge field in terms of induced spinor curvature and Kähler form  $J$  as

$$\begin{aligned}
R_{03} &= 2(2e^0 \wedge e^3 + e^1 \wedge e^2) = J + 2e^0 \wedge e^3 \quad , \\
J &= 2(e^0 \wedge e^3 + e^1 \wedge e^2) \quad , \\
R_{12} &= 2(e^0 \wedge e^3 + 2e^1 \wedge e^2) = 3J - 2e^0 \wedge e^3 \quad , 
\end{aligned} \tag{A-2.50}$$

2. The induced fields  $\gamma$  and  $Z^0$  (photon and  $Z$ - boson) can be expressed as

$$\begin{aligned}
\gamma &= 3J - \sin^2\theta_W R_{12} \quad , \\
Z^0 &= 2R_{03} = 2(J + 2e^0 \wedge e^3)
\end{aligned} \tag{A-2.51}$$

$$\text{per.} \tag{A-2.52}$$

The condition  $\langle Z^0 \rangle = 0$  gives  $2\langle e^0 \wedge e^3 \rangle = -2J$  and this in turn gives  $\langle R_{12} \rangle = 4J$ . The average over  $\gamma$  would be

$$\langle \gamma \rangle = (3 - 4\sin^2\theta_W)J \quad .$$

For  $\sin^2\theta_W = 3/4$   $\langle \gamma \rangle$  would vanish.

The quantum averages of classical weak fields quite generally vanish. What about correlation functions?

1. One expects that the correlators of classical weak fields as color invariants, and perhaps even symplectic invariants, are non-vanishing below the Compton length since in this kind of situation the points in the correlation function belong to the same 3-surface representing particle, such as hadron.

2. The intuitive picture is that in longer length scales one has disjoint 3-surfaces with a size scale of Compton length. If the states associated with two disjoint 3-surfaces are separately color invariant there are no correlations in color degrees of freedom and correlators reduce to the products of expectations of classical weak fields and vanish. This could also hold when the 3-surfaces are connected by flux tube bonds.

Below the Compton length weak bosons would thus behave as correlated massless fields. The Compton lengths of weak bosons are proportional to the value of effective Planck constant  $h_{eff}$  and in living systems the Compton lengths are proposed to be even of the order of cell size. This would explain the mysterious chiral selection in living systems requiring large parity violation.

3. What about the averages and correlators of color gauge fields? Classical color gauge fields are proportional to the products of Hamiltonians of color isometries induced Kähler form and the expectations of color Hamiltonians give vanishing average above Compton length and therefore vanishing average. Correlators are non-vanishing below the hadron scale. Gluons do not propagate in long scales for the same reason as weak bosons. This is implied by color confinement, which has also classical description in the sense that 3-surfaces have necessarily a finite size.

A large value of  $h_{eff}$  allows colored states even in biological scales below the Compton length since in this kind of situation the points in the correlation function belong to the same 3-surface representing particle, such as dark hadron.

### Discrete symmetries

The treatment of discrete symmetries C, P, and T is based on the following requirements:

1. Symmetries must be realized as purely geometric transformations.
2. Transformation properties of the field variables should be essentially the same as in the conventional quantum field theories [B2] .

The action of the reflection  $P$  on spinors of is given by

$$\Psi \rightarrow P\Psi = \gamma^0 \otimes \gamma^0 \Psi . \quad (\text{A-2.53})$$

in the representation of the gamma matrices for which  $\gamma^0$  is diagonal. It should be noticed that  $W$  and  $Z^0$  bosons break parity symmetry as they should since their charge matrices do not commute with the matrix of P.

The guess that a complex conjugation in  $CP_2$  is associated with T transformation of the physicist turns out to be correct. One can verify by a direct calculation that pure Dirac action is invariant under T realized according to

$$\begin{aligned} m^k &\rightarrow T(M^k) , \\ \xi^k &\rightarrow \bar{\xi}^k , \\ \Psi &\rightarrow \gamma^1 \gamma^3 \otimes 1 \Psi . \end{aligned} \quad (\text{A-2.54})$$

The operation bearing closest resemblance to the ordinary charge conjugation corresponds geometrically to complex conjugation in  $CP_2$ :

$$\begin{aligned} \xi^k &\rightarrow \bar{\xi}^k , \\ \Psi &\rightarrow \Psi^\dagger \gamma^2 \gamma^0 \otimes 1 . \end{aligned} \quad (\text{A-2.55})$$

As one might have expected symmetries CP and T are exact symmetries of the pure Dirac action.

## A-3 Induction procedure and many-sheeted space-time

Since the classical gauge fields are closely related in TGD framework, it is not possible to have space-time sheets carrying only single kind of gauge field. For instance, em fields are accompanied by  $Z^0$  fields for extremals of Kähler action.

Classical em fields are always accompanied by  $Z^0$  field and some components of color gauge field. For extremals having homologically non-trivial sphere as a  $CP_2$  projection em and  $Z^0$  fields are the only non-vanishing electroweak gauge fields. For homologically trivial sphere only  $W$  fields are non-vanishing. Color rotations does not affect the situation.

For vacuum extremals all electro-weak gauge fields are in general non-vanishing although the net gauge field has  $U(1)$  holonomy by 2-dimensionality of the  $CP_2$  projection. Color gauge field has  $U(1)$  holonomy for all space-time surfaces and quantum classical correspondence suggest a weak form of color confinement meaning that physical states correspond to color neutral members of color multiplets.

### A-3.1 Induction procedure for gauge fields and spinor connection

Induction procedure for gauge potentials and spinor structure is a standard procedure of bundle theory. If one has embedding of some manifold to the base space of a bundle, the bundle structure can be induced so that it has as a base space the imbedded manifold, whose points have as fiber the fiber if embedding space at their image points. In the recent case the embedding of space-time surface to embedding space defines the induction procedure. The induced gauge potentials and gauge fields are projections of the spinor connection of the embedding space to the space-time surface (see <http://tgdtheory.fi/appfigures/induct.jpg>).

Induction procedure makes sense also for the spinor fields of embedding space and one obtains geometrization of both electroweak gauge potentials and of spinors. The new element is induction of gamma matrices which gives their projections at space-time surface.

As a matter fact, the induced gamma matrices cannot appear in the counterpart of massless Dirac equation. To achieve super-symmetry, Dirac action must be replaced with Kähler-Dirac action for which gamma matrices are contractions of the canonical momentum currents of Kähler action with embedding space gamma matrices. Induced gamma matrices in Dirac action would correspond to 4-volume as action.

**Fig. 9.** Induction of spinor connection and metric as projection to the space-time surface. <http://tgdtheory.fi/appfigures/induct.jpg>.

### A-3.2 Induced gauge fields for space-times for which $CP_2$ projection is a geodesic sphere

If one requires that space-time surface is an extremal of Kähler action and has a 2-dimensional  $CP_2$  projection, only vacuum extremals and space-time surfaces for which  $CP_2$  projection is a geodesic sphere, are allowed. Homologically non-trivial geodesic sphere correspond to vanishing  $W$  fields and homologically non-trivial sphere to non-vanishing  $W$  fields but vanishing  $\gamma$  and  $Z^0$ . This can be verified by explicit examples.

$r = \infty$  surface gives rise to a homologically non-trivial geodesic sphere for which  $e_0$  and  $e_3$  vanish imply the vanishing of  $W$  field. For space-time sheets for which  $CP_2$  projection is  $r = \infty$  homologically non-trivial geodesic sphere of  $CP_2$  one has

$$\gamma = \left(\frac{3}{4} - \frac{\sin^2(\theta_W)}{2}\right)Z^0 \simeq \frac{5Z^0}{8} .$$

The induced  $W$  fields vanish in this case and they vanish also for all geodesic sphere obtained by  $SU(3)$  rotation.

$Im(\xi^1) = Im(\xi^2) = 0$  corresponds to homologically trivial geodesic sphere. A more general representative is obtained by using for the phase angles of standard complex  $CP_2$  coordinates constant values. In this case  $e^1$  and  $e^3$  vanish so that the induced em,  $Z^0$ , and Kähler fields vanish but induced  $W$  fields are non-vanishing. This holds also for surfaces obtained by color rotation. Hence one can say that for non-vacuum extremals with 2-D  $CP_2$  projection color rotations and weak symmetries commute.

### A-3.3 Many-sheeted space-time

TGD space-time is many-sheeted: in other words, there are in general several space-sheets which have projection to the same  $M^4$  region. Second manner to say this is that  $CP_2$  coordinates are many-valued functions of  $M^4$  coordinates. The original physical interpretation of many-sheeted space-time time was not correct: it was assumed that single sheet corresponds to GRT space-time and this obviously leads to difficulties since the induced gauge fields are expressible in terms of only four embedding space coordinates.

**Fig. 10.** Illustration of many-sheeted space-time of TGD. <http://tgdtheory.fi/appfigures/manysheeted.jpg>

#### Superposition of effects instead of superposition of fields

The first objection against TGD is that superposition is not possible for induced gauge fields and induced metric. The resolution of the problem is that it is effects which need to superpose, not the fields.

Test particle topologically condenses simultaneously to all space-time sheets having a projection to same region of  $M^4$  (that is touches them). The superposition of effects of fields at various space-time sheets replaces the superposition of fields. This is crucial for the understanding also how GRT space-time relates to TGD space-time, which is also in the appendix of this book).

#### Wormhole contacts

Wormhole contacts are key element of many-sheeted space-time. One does not expect them to be stable unless there is non-trivial Kähler magnetic flux flowing through them so that the throats look like Kähler magnetic monopoles.

**Fig. 11.** Wormhole contact. <http://tgdtheory.fi/appfigures/wormholecontact.jpg>

Since the flow lines of Kähler magnetic field must be closed this requires the presence of another wormhole contact so that one obtains closed monopole flux tube decomposing to two Minkowskian pieces at the two space-time sheets involved and two wormhole contacts with Euclidian signature of the induced metric. These objects are identified as space-time correlates of elementary particles and are clearly analogous to string like objects.

#### The relationship between the many-sheeted space-time of TGD and of GRT space-time

The space-time of general relativity is single-sheeted and there is no need to regard it as surface in  $H$  although the assumption about representability as vacuum extremal gives very powerful constraints in cosmology and astrophysics and might make sense in simple situations.

The space-time of GRT can be regarded as a long length scale approximation obtained by lumping together the sheets of the many-sheeted space-time to a region of  $M^4$  and providing it with an effective metric obtained as sum of  $M^4$  metric and deviations of the induced metrics of various space-time sheets from  $M^4$  metric. Also induced gauge potentials sum up in the similar manner so that also the gauge fields of gauge theories would not be fundamental fields.

**Fig. 12.** The superposition of fields is replaced with the superposition of their effects in many-sheeted space-time. <http://tgdtheory.fi/appfigures/fieldsuperpose.jpg>

Space-time surfaces of TGD are considerably simpler objects than the space-times of general relativity and relate to GRT space-time like elementary particles to systems of condensed matter physics. Same can be said about fields since all fields are expressible in terms of embedding space coordinates and their gradients, and general coordinate invariance means that the number of bosonic field degrees is reduced locally to 4. TGD space-time can be said to be a microscopic description whereas GRT space-time a macroscopic description. In TGD complexity of space-time topology replaces the complexity due to large number of fields in quantum field theory.

#### Topological field quantization and the notion of magnetic body

Topological field quantization also TGD from Maxwell's theory. TGD predicts topological light rays ("massless extremals (MEs)") as space-time sheets carrying waves or arbitrary shape propagating

with maximal signal velocity in single direction only and analogous to laser beams and carrying light-like gauge currents in the generic case. There are also magnetic flux quanta and electric flux quanta. The deformations of cosmic strings with 2-D string orbit as  $M^4$  projection gives rise to magnetic flux tubes carrying monopole flux made possible by  $CP_2$  topology allowing homological Kähler magnetic monopoles.

**Fig. 13.** Topological quantization for magnetic fields replaces magnetic fields with bundles of them defining flux tubes as topological field quanta. <http://tgdtheory.fi/appfigures/field.jpg>

The imbeddability condition for say magnetic field means that the region containing constant magnetic field splits into flux quanta, say tubes and sheets carrying constant magnetic field. Unless one assumes a separate boundary term in Kähler action, boundaries in the usual sense are forbidden except as ends of space-time surfaces at the boundaries of causal diamonds. One obtains typically pairs of sheets glued together along their boundaries giving rise to flux tubes with closed cross section possibly carrying monopole flux.

These kind of flux tubes might make possible magnetic fields in cosmic scales already during primordial period of cosmology since no currents are needed to generate these magnetic fields: cosmic string would be indeed this kind of objects and would be dominated during the primordial period. Even superconductors and maybe even ferromagnets could involve this kind of monopole flux tubes.

### A-3.4 Embedding space spinors and induced spinors

One can geometrize also fermionic degrees of freedom by inducing the spinor structure of  $M^4 \times CP_2$ .

$CP_2$  does not allow spinor structure in the ordinary sense but one can couple the opposite  $H$ -chiralities of  $H$ -spinors to an  $n = 1$  ( $n = 3$ ) integer multiple of Kähler gauge potential to obtain a respectable modified spinor structure. The em charges of resulting spinors are fractional (integer valued) and the interpretation as quarks (leptons) makes sense since the couplings to the induced spinor connection having interpretation in terms electro-weak gauge potential are identical to those assumed in standard model.

The notion of quark color differs from that of standard model.

1. Spinors do not couple to color gauge potential although the identification of color gauge potential as projection of  $SU(3)$  Killing vector fields is possible. This coupling must emerge only at the effective gauge theory limit of TGD.
2. Spinor harmonics of embedding space correspond to triality  $t = 1$  ( $t = 0$ ) partial waves. The detailed correspondence between color and electroweak quantum numbers is however not correct as such and the interpretation of spinor harmonics of embedding space is as representations for ground states of super-conformal representations. The wormhole pairs associated with physical quarks and leptons must carry also neutrino pair to neutralize weak quantum numbers above the length scale of flux tube (weak scale or Compton length). The total color quantum numbers of these states must be those of standard model. For instance, the color quantum numbers of fundamental left-hand neutrino and lepton can compensate each other for the physical lepton. For fundamental quark-lepton pair they could sum up to those of physical quark.

The well-definedness of em charge is crucial condition.

1. Although the embedding space spinor connection carries  $W$  gauge potentials one can say that the embedding space spinor modes have well-defined em charge. One expects that this is true for induced spinor fields inside wormhole contacts with 4-D  $CP_2$  projection and Euclidian signature of the induced metric.
2. The situation is not the same for the modes of induced spinor fields inside Minkowskian region and one must require that the  $CP_2$  projection of the regions carrying induced spinor field is such that the induced  $W$  fields and above weak scale also the induced  $Z^0$  fields vanish in order to avoid large parity breaking effects. This condition forces the  $CP_2$  projection to be 2-dimensional. For a generic Minkowskian space-time region this is achieved only if the

spinor modes are localized at 2-D surfaces of space-time surface - string world sheets and possibly also partonic 2-surfaces.

3. Also the Kähler-Dirac gamma matrices appearing in the modified Dirac equation must vanish in the directions normal to the 2-D surface in order that Kähler-Dirac equation can be satisfied. This does not seem plausible for space-time regions with 4-D  $CP_2$  projection.
4. One can thus say that strings emerge from TGD in Minkowskian space-time regions. In particular, elementary particles are accompanied by a pair of fermionic strings at the opposite space-time sheets and connecting wormhole contacts. Quite generally, fundamental fermions would propagate at the boundaries of string world sheets as massless particles and wormhole contacts would define the stringy vertices of generalized Feynman diagrams. One obtains geometrized diagrammatics, which brings looks like a combination of stringy and Feynman diagrammatics.
5. This is what happens in the the generic situation. Cosmic strings could serve as examples about surfaces with 2-D  $CP_2$  projection and carrying only em fields and allowing delocalization of spinor modes to the entire space-time surfaces.

### A-3.5 About induced gauge fields

In the following the induced gauge fields are studied for general space-time surface without assuming the preferred extremal property (Bohr orbit property). Therefore the following arguments are somewhat obsolete in their generality.

#### Space-times with vanishing em, $Z^0$ , or Kähler fields

The following considerations apply to a more general situation in which the homologically trivial geodesic sphere and extremal property are not assumed. It must be emphasized that this case is possible in TGD framework only for a vanishing Kähler field.

Using spherical coordinates  $(r, \Theta, \Psi, \Phi)$  for  $CP_2$ , the expression of Kähler form reads as

$$\begin{aligned} J &= \frac{r}{F^2} dr \wedge (d\Psi + \cos(\Theta)d\Phi) + \frac{r^2}{2F} \sin(\Theta)d\Theta \wedge d\Phi , \\ F &= 1 + r^2 . \end{aligned} \tag{A-3.1}$$

The general expression of electromagnetic field reads as

$$\begin{aligned} F_{em} &= (3 + 2p) \frac{r}{F^2} dr \wedge (d\Psi + \cos(\Theta)d\Phi) + (3 + p) \frac{r^2}{2F} \sin(\Theta)d\Theta \wedge d\Phi , \\ p &= \sin^2(\Theta_W) , \end{aligned} \tag{A-3.2}$$

where  $\Theta_W$  denotes Weinberg angle.

1. The vanishing of the electromagnetic fields is guaranteed, when the conditions

$$\begin{aligned} \Psi &= k\Phi , \\ (3 + 2p) \frac{1}{r^2 F} (d(r^2)/d\Theta)(k + \cos(\Theta)) + (3 + p) \sin(\Theta) &= 0 , \end{aligned} \tag{A-3.3}$$

hold true. The conditions imply that  $CP_2$  projection of the electromagnetically neutral space-time is 2-dimensional. Solving the differential equation one obtains

$$\begin{aligned}
r &= \sqrt{\frac{X}{1-X}} , \\
X &= D \left[ \left| \frac{k+u}{C} \right| \right]^\epsilon , \\
u &\equiv \cos(\Theta) , \quad C = k + \cos(\Theta_0) , \quad D = \frac{r_0^2}{1+r_0^2} , \quad \epsilon = \frac{3+p}{3+2p} ,
\end{aligned} \tag{A-3.4}$$

where  $C$  and  $D$  are integration constants.  $0 \leq X \leq 1$  is required by the reality of  $r$ .  $r = 0$  would correspond to  $X = 0$  giving  $u = -k$  achieved only for  $|k| \leq 1$  and  $r = \infty$  to  $X = 1$  giving  $|u+k| = [(1+r_0^2)/r_0^2]^{(3+2p)/(3+p)}$  achieved only for

$$\text{sign}(u+k) \times \left[ \frac{1+r_0^2}{r_0^2} \right]^{\frac{3+2p}{3+p}} \leq k+1 ,$$

where  $\text{sign}(x)$  denotes the sign of  $x$ .

The expressions for Kähler form and  $Z^0$  field are given by

$$\begin{aligned}
J &= -\frac{p}{3+2p} X du \wedge d\Phi , \\
Z^0 &= -\frac{6}{p} J .
\end{aligned} \tag{A-3.5}$$

The components of the electromagnetic field generated by varying vacuum parameters are proportional to the components of the Kähler field: in particular, the magnetic field is parallel to the Kähler magnetic field. The generation of a long range  $Z^0$  vacuum field is a purely TGD based feature not encountered in the standard gauge theories.

2. The vanishing of  $Z^0$  fields is achieved by the replacement of the parameter  $\epsilon$  with  $\epsilon = 1/2$  as becomes clear by considering the condition stating that  $Z^0$  field vanishes identically. Also the relationship  $F_{em} = 3J = -\frac{3}{4} \frac{r^2}{F} du \wedge d\Phi$  is useful.
3. The vanishing Kähler field corresponds to  $\epsilon = 1, p = 0$  in the formula for em neutral space-times. In this case classical em and  $Z^0$  fields are proportional to each other:

$$\begin{aligned}
Z^0 &= 2e^0 \wedge e^3 = \frac{r}{F^2} (k+u) \frac{\partial r}{\partial u} du \wedge d\Phi = (k+u) du \wedge d\Phi , \\
r &= \sqrt{\frac{X}{1-X}} , \quad X = D|k+u| , \\
\gamma &= -\frac{p}{2} Z^0 .
\end{aligned} \tag{A-3.6}$$

For a vanishing value of Weinberg angle ( $p = 0$ ) em field vanishes and only  $Z^0$  field remains as a long range gauge field. Vacuum extremals for which long range  $Z^0$  field vanishes but em field is non-vanishing are not possible.

### The effective form of $CP_2$ metric for surfaces with 2-dimensional $CP_2$ projection

The effective form of the  $CP_2$  metric for a space-time having vanishing  $em, Z^0$ , or Kähler field is of practical value in the case of vacuum extremals and is given by

$$\begin{aligned} ds_{eff}^2 &= (s_{rr}(\frac{dr}{d\Theta})^2 + s_{\Theta\Theta})d\Theta^2 + (s_{\Phi\Phi} + 2ks_{\Phi\Psi})d\Phi^2 = \frac{R^2}{4}[s_{\Theta\Theta}^{eff}d\Theta^2 + s_{\Phi\Phi}^{eff}d\Phi^2] , \\ s_{\Theta\Theta}^{eff} &= X \times \left[ \frac{\epsilon^2(1-u^2)}{(k+u)^2} \times \frac{1}{1-X} + 1 - X \right] , \\ s_{\Phi\Phi}^{eff} &= X \times [(1-X)(k+u)^2 + 1 - u^2] , \end{aligned} \quad (A-3.7)$$

and is useful in the construction of vacuum embedding of, say Schwartzchild metric.

### Topological quantum numbers

Space-times for which either  $em, Z^0$ , or Kähler field vanishes decompose into regions characterized by six vacuum parameters: two of these quantum numbers ( $\omega_1$  and  $\omega_2$ ) are frequency type parameters, two ( $k_1$  and  $k_2$ ) are wave vector like quantum numbers, two of the quantum numbers ( $n_1$  and  $n_2$ ) are integers. The parameters  $\omega_i$  and  $n_i$  will be referred as electric and magnetic quantum numbers. The existence of these quantum numbers is not a feature of these solutions alone but represents a much more general phenomenon differentiating in a clear cut manner between TGD and Maxwell's electrodynamics.

The simplest manner to avoid surface Kähler charges and discontinuities or infinities in the derivatives of  $CP_2$  coordinates on the common boundary of two neighboring regions with different vacuum quantum numbers is topological field quantization, 3-space decomposes into disjoint topological field quanta, 3-surfaces having outer boundaries with possibly macroscopic size.

Under rather general conditions the coordinates  $\Psi$  and  $\Phi$  can be written in the form

$$\begin{aligned} \Psi &= \omega_2 m^0 + k_2 m^3 + n_2 \phi + \text{Fourier expansion} , \\ \Phi &= \omega_1 m^0 + k_1 m^3 + n_1 \phi + \text{Fourier expansion} . \end{aligned} \quad (A-3.8)$$

$m^0, m^3$  and  $\phi$  denote the coordinate variables of the cylindrical  $M^4$  coordinates) so that one has  $k = \omega_2/\omega_1 = n_2/n_1 = k_2/k_1$ . The regions of the space-time surface with given values of the vacuum parameters  $\omega_i, k_i$  and  $n_i$  and  $m$  and  $C$  are bounded by the surfaces at which space-time surface becomes ill-defined, say by  $r > 0$  or  $r < \infty$  surfaces.

The space-time surface decomposes into regions characterized by different values of the vacuum parameters  $r_0$  and  $\Theta_0$ . At  $r = \infty$  surfaces  $n_2, \omega_2$  and  $m$  can change since all values of  $\Psi$  correspond to the same point of  $CP_2$ : at  $r = 0$  surfaces also  $n_1$  and  $\omega_1$  can change since all values of  $\Phi$  correspond to same point of  $CP_2$ , too. If  $r = 0$  or  $r = \infty$  is not in the allowed range space-time surface develops a boundary.

This implies what might be called topological quantization since in general it is not possible to find a smooth global embedding for, say a constant magnetic field. Although global embedding exists it decomposes into regions with different values of the vacuum parameters and the coordinate  $u$  in general possesses discontinuous derivative at  $r = 0$  and  $r = \infty$  surfaces. A possible manner to avoid edges of space-time is to allow field quantization so that 3-space (and field) decomposes into disjoint quanta, which can be regarded as structurally stable units a 3-space (and of the gauge field). This doesn't exclude partial join along boundaries for neighboring field quanta provided some additional conditions guaranteeing the absence of edges are satisfied.

For instance, the vanishing of the electromagnetic fields implies that the condition

$$\Omega \equiv \frac{\omega_2}{n_2} - \frac{\omega_1}{n_1} = 0 , \quad (A-3.9)$$

is satisfied. In particular, the ratio  $\omega_2/\omega_1$  is rational number for the electromagnetically neutral regions of space-time surface. The change of the parameter  $n_1$  and  $n_2$  ( $\omega_1$  and  $\omega_2$ ) in general generates magnetic field and therefore these integers will be referred to as magnetic (electric) quantum numbers.

## A-4 The relationship of TGD to QFT and string models

The recent view of the relationship of TGD to QFT and string models has developed slowly during years and it seems that in a certain sense TGD means a return to roots: instead of QFT like description involving path integral one would have wave mechanics for 3-surfaces.

### A-4.1 TGD as a generalization of wave mechanism obtained by replacing point-like particles with 3-surfaces

The first vision of TGD was as a generalization of quantum field theory (string models) obtained by replacing pointlike particles (strings) as fundamental objects with 3-surfaces.

The later work has revealed that TGD could be seen as a generalization of the wave mechanism based on the replacement of a point-like particle with 3-D surface. This is due to holography implied by general coordinate invariance. The definition of the metric of the "world of classical worlds" (WCW) must assign a unique or at least almost unique space-time surface to a given 3-surface. This 4-surface is analogous to Bohr orbit so that also Bohr orbitology becomes an exact part of quantum physics. The failure of strict determinism forces to replace 3-surfaces with 4-surfaces and this leads to zero energy ontology (ZEO) in which quantum states are superpositions of space-time surfaces [K40, K20, K72] [L39, L52].

**Fig. 5.** TGD replaces point-like particles with 3-surfaces. <http://tgdtheory.fi/appfigures/particletgd.jpg>

### A-4.2 Extension of superconformal invariance

The fact that light-like 3-surfaces are effectively metrically 2-dimensional and thus possess generalization of 2-dimensional conformal symmetries with light-like radial coordinate defining the analog of second complex coordinate suggests that this generalization could work and extend the super-conformal symmetries to their 4-D analogs.

The boundary  $\delta M_+^4 = S^2 \times R_{+-}$  of 4-D light-cone  $M_+^4$  is also metrically 2-dimensional and allows extended conformal invariance. Also the group of isometries of light-cone boundary and of light-like 3-surfaces is infinite-dimensional since the conformal scalings of  $S^2$  can be compensated by  $S^2$ -local scaling of the light-like radial coordinate of  $R_+$ . These simple facts mean that 4-dimensional Minkowski space and 4-dimensional space-time surfaces are in a completely unique position as far as symmetries are considered.

In fact, this leads to a generalization of the Kac-Moody type symmetries of string models.  $\delta M_+^4 \times CP_2$  allows huge supersymplectic symmetries for which the radial light-like coordinate of  $\delta M_+^4$  plays the role of complex string coordinate in string models. These symmetries are assumed to act as isometries of WCW.

### A-4.3 String-like objects and strings

String like objects obtained as deformations of cosmic strings  $X^2 \times Y^2$ , where  $X^2$  is minimal surface in  $M^4$  and  $Y^2$  a holomorphic surface of  $CP_2$  are fundamental extremals of Kähler action having string world sheet as  $M^4$  projections. Cosmic strings dominate the primordial cosmology of the TGD Universe and the inflationary period corresponds to the transition to radiation dominated cosmology for which space-time sheets with 4-D  $M^4$  projection dominate.

Also genuine string-like objects emerge from TGD. The conditions that the em charge of modes of induces spinor fields is well-defined requires in the generic case the localization of the modes at 2-D surfaces -string world sheets and possibly also partonic 2-surfaces. This in Minkowskian space-time regions.

**Fig. 6.** Well-definedness of em charge forces the localization of induced spinor modes to 2-D surfaces in generic situations in Minkowskian regions of space-time surface. <http://tgdtheory.fi/appfigures/fermistring.jpg>

### A-4.4 TGD view of elementary particles

The TGD based view about elementary particles has two key aspects.

1. The space-time correlates of elementary particles are identified as pairs of wormhole contacts with Euclidean signature of metric and having 4-D  $CP_2$  projection. Their throats behave effectively as Kähler magnetic monopoles so that wormhole throats must be connected by Kähler magnetic flux tubes with monopole flux so that closed flux tubes are obtained.
2. At the level of  $H$  Fermion number is carried by the modes of the induced spinor field. In space-time regions with Minkowski signature the modes are localized at string world sheets connecting the wormhole contacts.

**Fig. 7.** TGD view about elementary particles. a) Particle orbit corresponds to a 4-D generalization of a world line or b) with its light-like 3-D boundary (holography). c) Particle world lines have Euclidean signature of the induced metric. d) They can be identified as wormhole contacts. e) The throats of wormhole contacts carry effective Kähler magnetic charges so that wormhole contacts must appear as pairs in order to obtain closed flux tubes. f) Wormhole contacts are accompanied by fermionic strings connecting the throats at the same sheet: the strings do not extend inside the wormhole contacts. <http://tgdtheory.fi/appfigures/elparticletgd.jpg>

Particle interactions involve both stringy and QFT aspects.

1. The boundaries of string world sheets correspond to fundamental fermions. This gives rise to massless propagator lines in generalized Feynman diagrammatics. One can speak of “long” string connecting wormhole contacts and having a hadronic string as a physical counterpart. Long strings should be distinguished from wormhole contacts which due to their superconformal invariance behave like “short” strings with length scale given by  $CP_2$  size, which is  $10^4$  times longer than Planck scale characterizing strings in string models.
2. Wormhole contact defines basic stringy interaction vertex for fermion-fermion scattering. The propagator is essentially the inverse of the superconformal scaling generator  $L_0$ . Wormhole contacts containing fermion and antifermion at its opposite throats behave like virtual bosons so that one has BFF type vertices typically.
3. In topological sense one has 3-vertices serving as generalizations of 3-vertices of Feynman diagrams. In these vertices 4-D “lines” of generalized Feynman diagrams meet along their 3-D ends. One obtains also the analogs of stringy diagrams but stringy vertices do not have the usual interpretation in terms of particle decays but in terms of propagation of particles along two different routes.

**Fig. 8.** a) TGD analogs of Feynman and string diagrammatics at the level of space-time topology. b) The 4-D analogs of both string diagrams and QFT diagrams appear but the interpretation of the analogs stringy diagrams is different. <http://tgdtheory.fi/appfigures/tgdgraphs.jpg>

## A-5 About the selection of the action defining the Kähler function of the “world of classical worlds” (WCW)

The proposal is that space-time surfaces correspond to preferred extremals of some action principle, being analogous to Bohr orbits, so that they are almost deterministic. The action for the preferred extremal would define the Kähler function of WCW [K40, K72].

How unique is the choice of the action defining WCW Kähler metric? The problem is that twistor lift strongly suggests the identification of the preferred extremals as 4-D surfaces having 4-D generalization of complex structure and that a large number of general coordinate invariant actions constructible in terms of the induced geometry have the same preferred extremals.

### A-5.1 Could twistor lift fix the choice of the action uniquely?

The twistor lift of TGD [L13] [L39, L43, L44] generalizes the notion of induction to the level of twistor fields and leads to a proposal that the action is obtained by dimensional reduction of the action having as its preferred extremals the counterpart of twistor space of the space-time surface identified as 6-D surface in the product  $T(M^4) \times T(CP_2)$  twistor spaces of  $T(M^4)$  and  $T(CP_2)$

of  $M^4$  and  $CP_2$ . Only  $M^4$  and  $CP_2$  allow a twistor space with Kähler structure [A12] so that TGD would be unique. Dimensional reduction is forced by the condition that the 6-surface has  $S^2$ -bundle structure characterizing twistor spaces and the base space would be the space-time surface.

1. Dimensional reduction of 6-D Kähler action implies that at the space-time level the fundamental action can be identified as the sum of Kähler action and volume term (cosmological constant). Other choices of the action do not look natural in this picture although they would have the same preferred extremals.
2. Preferred extremals are proposed to correspond to minimal surfaces with singularities such that they are also extremals of 4-D Kähler action outside the singularities. The physical analogue are soap films spanned by frames and one can localize the violation of the strict determinism and of strict holography to the frames.
3. The preferred extremal property is realized as the holomorphicity characterizing string world sheets, which generalizes to the 4-D situation. This in turn implies that the preferred extremals are the same for any general coordinate invariant action defined on the induced gauge fields and induced metric apart from possible extremals with vanishing  $CP_2$  Kähler action.

For instance, 4-D Kähler action and Weyl action as the sum of the tensor squares of the components of the Weyl tensor of  $CP_2$  representing quaternionic imaginary units constructed from the Weyl tensor of  $CP_2$  as an analog of gauge field would have the same preferred extremals and only the definition of Kähler function and therefore Kähler metric of WCW would change. One can even consider the possibility that the volume term in the 4-D action could be assigned to the tensor square of the induced metric representing a quaternionic or octonionic real unit.

Action principle does not seem to be unique. On the other hand, the WCW Kähler form and metric should be unique since its existence requires maximal isometries.

Unique action is not the only way to achieve this. One cannot exclude the possibility that the Kähler gauge potential of WCW in the complex coordinates of WCW differs only by a complex gradient of a holomorphic function for different actions so that they would give the same Kähler form for WCW. This gradient is induced by a symplectic transformation of WCW inducing a  $U(1)$  gauge transformation. The Kähler metric is the same if the symplectic transformation is an isometry.

Symplectic transformations of WCW could give rise to inequivalent representations of the theory in terms of action at space-time level. Maybe the length scale dependent coupling parameters of an effective action could be interpreted in terms of a choice of WCW Kähler function, which maximally simplifies the computations at a given scale.

1. The 6-D analogues of electroweak action and color action reducing to Kähler action in 4-D case exist. The 6-D analog of Weyl action based on the tensor representation of quaternionic imaginary units does not however exist. One could however consider the possibility that only the base space of twistor space  $T(M^4)$  and  $T(CP_2)$  have quaternionic structure.
2. Kähler action has a huge vacuum degeneracy, which clearly distinguishes it from other actions. The presence of the volume term removes this degeneracy. However, for minimal surfaces having  $CP_2$  projections, which are Lagrangian manifolds and therefore have a vanishing induced Kähler form, would be preferred extremals according to the proposed definition. For these 4-surfaces, the existence of the generalized complex structure is dubious.

For the electroweak action, the terms corresponding to charged weak bosons eliminate these extremals and one could argue that electroweak action or its sum with the analogue of color action, also proportional Kähler action, defines the more plausible choice. Interestingly, also the neutral part of electroweak action is proportional to Kähler action.

Twistor lift strongly suggests that also  $M^4$  has the analog of Kähler structure.  $M^8$  must be complexified by adding a commuting imaginary unit  $i$ . In the  $E^8$  subspace, the Kähler structure of  $E^4$  is defined in the standard sense and it is proposed that this generalizes to  $M^4$  allowing also

generalization of the quaternionic structure.  $M^4$  Kähler structure violates Lorentz invariance but could be realized at the level of moduli space of these structures.

The minimal possibility is that the  $M^4$  Kähler form vanishes: one can have a different representation of the Kähler gauge potential for it obtained as generalization of symplectic transformations acting non-trivially in  $M^4$ . The recent picture about the second quantization of spinors of  $M^4 \times CP_2$  assumes however non-trivial Kähler structure in  $M^4$ .

## A-5.2 Two paradoxes

TGD view leads to two apparent paradoxes.

1. If the preferred extremals satisfy 4-D generalization of holomorphicity, a very large set of actions gives rise to the same preferred extremals unless there are some additional conditions restricting the number of preferred extremals for a given action.
2. WCW metric has an infinite number of zero modes, which appear as parameters of the metric but do not contribute to the line element. The induced Kähler form depends on these degrees of freedom. The existence of the Kähler metric requires maximal isometries, which suggests that the Kähler metric is uniquely fixed apart from a conformal scaling factor  $\Omega$  depending on zero modes. This cannot be true: galaxy and elementary particle cannot correspond to the same Kähler metric.

Number theoretical vision and the hierarchy of inclusions of HFFs associated with supersymplectic algebra actings as isometries of WCW provide equivalent realizations of the measurement resolution. This solves these paradoxes and predicts that WCW decomposes into sectors for which Kähler metrics of WCW differ in a natural way.

### The hierarchy subalgebras of supersymplectic algebra implies the decomposition of WCW into sectors with different actions

Supersymplectic algebra of  $\delta M_+^4 \times CP_2$  is assumed to act as isometries of WCW [L52]. There are also other important algebras but these will not be discussed now.

1. The symplectic algebra  $A$  of  $\delta M_+^4 \times CP_2$  has the structure of a conformal algebra in the sense that the radial conformal weights with non-negative real part, which is half integer, label the elements of the algebra have an interpretation as conformal weights.

The super symplectic algebra  $A$  has an infinite hierarchy of sub-algebras [L52] such that the conformal weights of sub-algebras  $A_{n(SS)}$  are integer multiples of the conformal weights of the entire algebra. The superconformal gauge conditions are weakened. Only the subalgebra  $A_{n(SS)}$  and the commutator  $[A_{n(SS)}, A]$  annihilate the physical states. Also the corresponding classical Noether charges vanish for allowed space-time surfaces.

This weakening makes sense also for ordinary superconformal algebras and associated Kac-Moody algebras. This hierarchy can be interpreted as a hierarchy symmetry breakings, meaning that sub-algebra  $A_{n(SS)}$  acts as genuine dynamical symmetries rather than mere gauge symmetries. It is natural to assume that the super-symplectic algebra  $A$  does not affect the coupling parameters of the action.

2. The generators of  $A$  correspond to the dynamical quantum degrees of freedom and leave the induced Kähler form invariant. They affect the induced space-time metric but this effect is gravitational and very small for Einsteinian space-time surfaces with 4-D  $M^4$  projection.

The number of dynamical degrees of freedom increases with  $n(SS)$ . Therefore WCW decomposes into sectors labelled by  $n(SS)$  with different numbers of dynamical degrees of freedom so that their Kähler metrics cannot be equivalent and cannot be related by a symplectic isometry. They can correspond to different actions.

**Number theoretic vision implies the decomposition of WCW into sectors with different actions**

The number theoretic vision leads to the same conclusion as the hierarchy of HFFs. The number theoretic vision of TGD based on  $M^8 - H$  duality [L52] predicts a hierarchy with levels labelled by the degrees  $n(P)$  of rational polynomials  $P$  and corresponding extensions of rationals characterized by Galois groups and by ramified primes defining p-adic length scales.

These sequences allow us to imagine several discrete coupling constant evolutions realized at the level  $H$  in terms of action whose coupling parameters depend on the number theoretic parameters.

1. *Coupling constant evolution with respect to  $n(P)$*

The first coupling constant evolution would be with respect to  $n(P)$ .

1. The coupling constants characterizing action could depend on the degree  $n(P)$  of the polynomial defining the space-time region by  $M^8 - H$  duality. The complexity of the space-time surface would increase with  $n(P)$  and new degrees of freedom would emerge as the number of the rational coefficients of  $P$ .
2. This coupling constant evolution could naturally correspond to that assignable to the inclusion hierarchy of hyperfinite factors of type  $II_1$  (HFFs). I have indeed proposed [L52] that the degree  $n(P)$  equals to the number  $n(braid)$  of braids assignable to HFF for which super symplectic algebra subalgebra  $A_{n(SS)}$  with radial conformal weights coming as  $n(SS)$ -multiples of those of entire algebra  $A$ . One would have  $n(P) = n(braid) = n(SS)$ . The number of dynamical degrees of freedom increases with  $n$  which just as it increases with  $n(P)$  and  $n(SS)$ .
3. The actions related to different values of  $n(P) = n(braid) = n(SS)$  cannot define the same Kähler metric since the number of allowed space-time surfaces depends on  $n(SS)$ .

WCW could decompose to sub-WCWs corresponding to different actions, a kind of theory space. These theories would not be equivalent. A possible interpretation would be as a hierarchy of effective field theories.

4. Hierarchies of composite polynomials define sequences of polynomials with increasing values of  $n(P)$  such that the order of a polynomial at a given level is divided by those at the lower levels. The proposal is that the inclusion sequences of extensions are realized at quantum level as inclusion hierarchies of hyperfinite factors of type  $II_1$ .

A given inclusion hierarchy corresponds to a sequence  $n(SS)_i$  such that  $n(SS)_i$  divides  $n(SS)_{i+1}$ . Therefore the degree of the composite polynomials increases very rapidly. The values of  $n(SS)_i$  can be chosen to be primes and these primes correspond to the degrees of so called prime polynomials [L46] so that the decompositions correspond to prime factorizations of integers. The "densest" sequence of this kind would come in powers of 2 as  $n(SS)_i = 2^i$ . The corresponding p-adic length scales (assignable to maximal ramified primes for given  $n(SS)_i$ ) are expected to increase roughly exponentially, say as  $2^{r2^i}$ .  $r = 1/2$  would give a subset of scales  $2^{r/2}$  allowed by the p-adic length scale hypothesis. These transitions would be very rare.

A theory corresponding to a given composite polynomial would contain as sub-theories the theories corresponding to lower polynomial composites. The evolution with respect to  $n(SS)$  would correspond to a sequence of phase transitions in which the action genuinely changes. For instance, color confinement could be seen as an example of this phase transition.

5. A subset of p-adic primes allowed by the p-adic length scale hypothesis  $p \simeq 2^k$  defining the proposed p-adic length scale hierarchy could relate to  $n_S$  changing phase transition. TGD suggests a hierarchy of hadron physics corresponding to a scale hierarchy defined by Mersenne primes and their Gaussian counterparts [K51, K52]). Each of them would be characterized by a confinement phase transition in which  $n_S$  and therefore also the action changes.

## 2. Coupling constant evolutions with respect to ramified primes for a given value of $n(P)$

For a given value of  $n(P)$ , one could have coupling constant sub-evolutions with respect to the set of ramified primes of  $P$  and dimensions  $n = h_{eff}/h_0$  of algebraic extensions. The action would only change by  $U(1)$  gauge transformation induced by a symplectic isometry of WCW. Coupling parameters could change but the actions would be equivalent.

The choice of the action in an optimal manner in a given scale could be seen as a choice of the most appropriate effective field theory in which radiative corrections would be taken into account. One can interpret the possibility to use a single choice of coupling parameters in terms of quantum criticality.

The range of the p-adic length scales labelled by ramified primes and effective Planck constants  $h_{eff}/h_0$  is finite for a given value of  $n(SS)$ .

The first coupling constant evolution of this kind corresponds to ramified primes defining p-adic length scales for given  $n(SS)$ .

1. Ramified primes are factors of the discriminant  $D(P)$  of  $P$ , which is expressible as a product of non-vanishing root differentials and reduces to a polynomial of the  $n$  coefficients of  $P$ . Ramified primes define p-adic length scales assignable to the particles in the amplitudes scattering amplitudes defined by zero energy states.

$P$  would represent the space-time surface defining an interaction region in  $N$ -particle scattering. The  $N$  ramified primes dividing  $D(P)$  would characterize the p-adic length scales assignable to these particles. If  $D(P)$  reduces to a single ramified prime, one has elementary particle [L46], and the forward scattering amplitude corresponds to the propagator.

This would give rise to a multi-scale p-adic length scale evolution of the amplitudes analogous to the ordinary continuous coupling constant evolution of n-point scattering amplitudes with respect to momentum scales of the particles. This kind of evolutions extend also to evolutions with respect to  $n(SS)$ .

2. According to [L46], physical constraints require that  $n(P)$  and the maximum size of the ramified prime of  $P$  correlate.

A given rational polynomial of degree  $n(P)$  can be always transformed to a polynomial with integer coefficients. If the integer coefficients are smaller than  $n(P)$ , there is an upper bound for the ramified primes. This assumption also implies that finite fields become fundamental number fields in number theoretical vision [L46].

3. p-Adic length scale hypothesis [L53] in its basic form states that there exist preferred primes  $p \simeq 2^k$  near some powers of 2. A more general hypothesis states that also primes near some powers of 3 possibly also other small primes are preferred physically. The challenge is to understand the origin of these preferred scales.

For polynomials  $P$  with a given degree  $n(P)$  for which discriminant  $D(P)$  is prime, there exists a maximal ramified prime. Numerical calculations suggest that the upper bound depends exponentially on  $n(P)$ .

Could these maximal ramified primes satisfy the p-adic length scale hypothesis or its generalization? The maximal prime defines a fixed point of coupling constant evolution in accordance with the earlier proposal. For instance, could one think that one has  $p \simeq 2^k$ ,  $k = n(SS)$ ? Each p-adic prime would correspond to a p-adic coupling constant sub-evolution representable in terms of symplectic isometries.

Also the dimension  $n$  of the algebraic extension associated with  $P$ , which is identified in terms of effective Planck constant  $h_{eff}/h_0 = n$  labelling different phases of the ordinary matter behaving like dark matter, could give rise to coupling constant evolution for given  $n(SS)$ . The range of allowed values of  $n$  is finite. Note however that several polynomials of a given degree can correspond to the same dimension of extension.

## Number theoretic discretization of WCW and maxima of WCW Kähler function

Number theoretic approach involves a unique discretization of space-time surface and also of WCW. The question is how the points of the discretized WCW correspond to the preferred extremals.

1. The exponents of Kähler function for the maxima of Kähler function, which correspond to the universal preferred extremals, appear in the scattering amplitudes. The number theoretical approach involves a unique discretization of space-time surfaces defining the WCW coordinates of the space-time surface regarded as a point of WCW.

In [L52] it is assumed that these WCW points appearing in the number theoretical discretization correspond to the maxima of the Kähler function. The maxima would depend on the action and would differ for ghd maxima associated with different actions unless they are not related by symplectic WCW isometry.

2. The symplectic transformations of WCW acting as isometries are assumed to be induced by the symplectic transformations of  $\delta M_{\pm}^4 \times CP_2$  [K40, K20]. As isometries they would naturally permute the maxima with each other.

## A-6 Number theoretic vision of TGD

Physics as number theory vision is complementary to the physics as geometry vision and has developed gradually since 1993. Langlands program is the counterpart of this vision in mathematics [L50].

The notion of p-adic number fields emerged with the motivation coming from the observation that elementary particle mass scales and mass ratios could be understood in terms of the so-called p-adic length scale hypothesis [K54, K46, K19]. The fusion of the various p-adic physics leads to what I call adelic physics [L11, L12]. Later the hypothesis about hierarchy of Planck constants labelling phases of ordinary matter behaving like dark matter emerged [K23, K24, K25, K26].

Eventually this led to that the values of effective Planck constant could be identified as the dimension of an algebraic extension of rationals assignable to polynomials with rational coefficients. This led to the number theoretic vision in which so-called  $M^8 - H$  duality [L29, L30] plays a key role.  $M^8$  (actually a complexification of real  $M^8$ ) is analogous to momentum space so that the duality generalizes momentum position duality for point-like particles.  $M^8$  has an interpretation as complexified octonions.

The dynamics of 4-surfaces in  $M^8$  is coded by polynomials with rational coefficients, whose roots define mass shells  $H^3$  of  $M^4 \subset M^8$ . It has turned out that the polynomials satisfy stringent additional conditions and one can speak of number theoretic holography [L46, L50]. Also the ordinary  $3 \rightarrow 4$  holography is needed to assign 4-surfaces with these 3-D mass shells. The number theoretic dynamics is based on the condition that the normal space of the 4-surface in  $M^8$  is associative (quaternionic) and contains a commutative complex sub-space. This makes it possible to assign to this surface space-time surface in  $H = M^4 \times CP_2$ .

At the level of  $H$  the space-time surfaces are by holography preferred extremals and are assumed to be determined by the twistor lift of TGD [L13] giving rise to an action which is sum of the Kähler action and volume term. The preferred extremals would be minimal surfaces analogous to soap films spanned by frames. Outside frames they would be simultaneous extremals of the Kähler action, which requires a generalization of the holomorphy characterizing string world sheets.

In the following only p-adic numbers and hierarchy of Planck constants will be discussed.

### A-6.1 p-Adic numbers and TGD

#### p-Adic number fields

p-Adic numbers ( $p$  is prime: 2, 3, 5, ...) can be regarded as a completion of the rational numbers using a norm, which is different from the ordinary norm of real numbers [A4]. p-Adic numbers are representable as power expansion of the prime number  $p$  of form

$$x = \sum_{k \geq k_0} x(k)p^k, \quad x(k) = 0, \dots, p-1 \quad . \quad (\text{A-6.1})$$

The norm of a p-adic number is given by

$$|x| = p^{-k_0(x)} . \quad (\text{A-6.2})$$

Here  $k_0(x)$  is the lowest power in the expansion of the p-adic number. The norm differs drastically from the norm of the ordinary real numbers since it depends on the lowest pinary digit of the p-adic number only. Arbitrarily high powers in the expansion are possible since the norm of the p-adic number is finite also for numbers, which are infinite with respect to the ordinary norm. A convenient representation for p-adic numbers is in the form

$$x = p^{k_0} \varepsilon(x) , \quad (\text{A-6.3})$$

where  $\varepsilon(x) = k + \dots$  with  $0 < k < p$ , is p-adic number with unit norm and analogous to the phase factor  $\exp(i\phi)$  of a complex number.

The distance function  $d(x, y) = |x - y|_p$  defined by the p-adic norm possesses a very general property called ultra-metricity:

$$d(x, z) \leq \max\{d(x, y), d(y, z)\} . \quad (\text{A-6.4})$$

The properties of the distance function make it possible to decompose  $R_p$  into a union of disjoint sets using the criterion that  $x$  and  $y$  belong to same class if the distance between  $x$  and  $y$  satisfies the condition

$$d(x, y) \leq D . \quad (\text{A-6.5})$$

This division of the metric space into classes has following properties:

1. Distances between the members of two different classes  $X$  and  $Y$  do not depend on the choice of points  $x$  and  $y$  inside classes. One can therefore speak about distance function between classes.
2. Distances of points  $x$  and  $y$  inside single class are smaller than distances between different classes.
3. Classes form a hierarchical tree.

Notice that the concept of the ultra-metricity emerged in physics from the models for spin glasses and is believed to have also applications in biology [B8]. The emergence of p-adic topology as the topology of the effective space-time would make ultra-metricity property basic feature of physics.

### Canonical correspondence between p-adic and real numbers

The basic challenge encountered by p-adic physicist is how to map the predictions of the p-adic physics to real numbers. p-Adic probabilities provide a basic example in this respect. Identification via common rationals and canonical identification and its variants have turned out to play a key role in this respect.

#### 1. Basic form of the canonical identification

There exists a natural continuous map  $I : R_p \rightarrow R_+$  from p-adic numbers to non-negative real numbers given by the ‘‘pinary’’ expansion of the real number for  $x \in R$  and  $y \in R_p$  this correspondence reads

$$y = \sum_{k > N} y_k p^k \rightarrow x = \sum_{k < N} y_k p^{-k} ,$$

$$y_k \in \{0, 1, \dots, p - 1\} . \quad (\text{A-6.6})$$

This map is continuous as one easily finds out. There is however a little difficulty associated with the definition of the inverse map since the pinary expansion like also decimal expansion is not unique ( $1 = 0.999\dots$ ) for the real numbers  $x$ , which allow pinary expansion with finite number of pinary digits

$$\begin{aligned}
 x &= \sum_{k=N_0}^N x_k p^{-k} , \\
 x &= \sum_{k=N_0}^{N-1} x_k p^{-k} + (x_N - 1)p^{-N} + (p - 1)p^{-N-1} \sum_{k=0,\dots} p^{-k} .
 \end{aligned}
 \tag{A-6.7}$$

The p-adic images associated with these expansions are different

$$\begin{aligned}
 y_1 &= \sum_{k=N_0}^N x_k p^k , \\
 y_2 &= \sum_{k=N_0}^{N-1} x_k p^k + (x_N - 1)p^N + (p - 1)p^{N+1} \sum_{k=0,\dots} p^k \\
 &= y_1 + (x_N - 1)p^N - p^{N+1} ,
 \end{aligned}
 \tag{A-6.8}$$

so that the inverse map is either two-valued for p-adic numbers having expansion with finite pinary digits or single valued and discontinuous and non-surjective if one makes pinary expansion unique by choosing the one with finite pinary digits. The finite pinary digit expansion is a natural choice since in the numerical work one always must use a pinary cutoff on the real axis.

2. The topology induced by canonical identification

The topology induced by the canonical identification in the set of positive real numbers differs from the ordinary topology. The difference is easily understood by interpreting the p-adic norm as a norm in the set of the real numbers. The norm is constant in each interval  $[p^k, p^{k+1})$  (see **Fig. A-6.1**) and is equal to the usual real norm at the points  $x = p^k$ : the usual linear norm is replaced with a piecewise constant norm. This means that p-adic topology is coarser than the usual real topology and the higher the value of  $p$  is, the coarser the resulting topology is above a given length scale. This hierarchical ordering of the p-adic topologies will be a central feature as far as the proposed applications of the p-adic numbers are considered.

Ordinary continuity implies p-adic continuity since the norm induced from the p-adic topology is rougher than the ordinary norm. p-Adic continuity implies ordinary continuity from right as is clear already from the properties of the p-adic norm (the graph of the norm is indeed continuous from right). This feature is one clear signature of the p-adic topology.

**Fig. 14.** The real norm induced by canonical identification from 2-adic norm. <http://tgdtheory.fi/appfigures/norm.png>

The linear structure of the p-adic numbers induces a corresponding structure in the set of the non-negative real numbers and p-adic linearity in general differs from the ordinary concept of linearity. For example, p-adic sum is equal to real sum only provided the summands have no common pinary digits. Furthermore, the condition  $x +_p y < \max\{x, y\}$  holds in general for the p-adic sum of the real numbers. p-Adic multiplication is equivalent with the ordinary multiplication only provided that either of the members of the product is power of  $p$ . Moreover one has  $x \times_p y < x \times y$  in general. The p-Adic negative  $-1_p$  associated with p-adic unit 1 is given by  $(-1)_p = \sum_k (p - 1)p^k$  and defines p-adic negative for each real number  $x$ . An interesting possibility is that p-adic linearity might replace the ordinary linearity in some strongly nonlinear systems so these systems would look simple in the p-adic topology.

These results suggest that canonical identification is involved with some deeper mathematical structure. The following inequalities hold true:

$$\begin{aligned} (x + y)_R &\leq x_R + y_R , \\ |x|_p |y|_R \leq (xy)_R &\leq x_R y_R , \end{aligned} \tag{A-6.9}$$

where  $|x|_p$  denotes p-adic norm. These inequalities can be generalized to the case of  $(R_p)^n$  (a linear vector space over the p-adic numbers).

$$\begin{aligned} (x + y)_R &\leq x_R + y_R , \\ |\lambda|_p |y|_R \leq (\lambda y)_R &\leq \lambda_R y_R , \end{aligned} \tag{A-6.10}$$

where the norm of the vector  $x \in T_p^n$  is defined in some manner. The case of Euclidian space suggests the definition

$$(x_R)^2 = \left( \sum_n x_n^2 \right)_R . \tag{A-6.11}$$

These inequalities resemble those satisfied by the vector norm. The only difference is the failure of linearity in the sense that the norm of a scaled vector is not obtained by scaling the norm of the original vector. Ordinary situation prevails only if the scaling corresponds to a power of  $p$ .

These observations suggests that the concept of a normed space or Banach space might have a generalization and physically the generalization might apply to the description of some non-linear systems. The nonlinearity would be concentrated in the nonlinear behavior of the norm under scaling.

### 3. Modified form of the canonical identification

The original form of the canonical identification is continuous but does not respect symmetries even approximately. This led to a search of variants which would do better in this respect. The modification of the canonical identification applying to rationals only and given by

$$I_Q(q = p^k \times \frac{r}{s}) = p^k \times \frac{I(r)}{I(s)} \tag{A-6.12}$$

is uniquely defined for rationals, maps rationals to rationals, has also a symmetry under exchange of target and domain. This map reduces to a direct identification of rationals for  $0 \leq r < p$  and  $0 \leq s < p$ . It has turned out that it is this map which most naturally appears in the applications. The map is obviously continuous locally since p-adically small modifications of  $r$  and  $s$  mean small modifications of the real counterparts.

Canonical identification is in a key role in the successful predictions of the elementary particle masses. The predictions for the light elementary particle masses are within extreme accuracy same for  $I$  and  $I_Q$  but  $I_Q$  is theoretically preferred since the real probabilities obtained from p-adic ones by  $I_Q$  sum up to one in p-adic thermodynamics.

### 4. Generalization of number concept and notion of embedding space

TGD forces an extension of number concept: roughly a fusion of reals and various p-adic number fields along common rationals is in question. This induces a similar fusion of real and p-adic embedding spaces. Since finite p-adic numbers correspond always to non-negative reals  $n$ -dimensional space  $R^n$  must be covered by  $2^n$  copies of the p-adic variant  $R_p^n$  of  $R^n$  each of which projects to a copy of  $R_+^n$  (four quadrants in the case of plane). The common points of p-adic and real embedding spaces are rational points and most p-adic points are at real infinity.

Real numbers and various algebraic extensions of p-adic number fields are thus glued together along common rationals and also numbers in algebraic extension of rationals whose number belong to the algebraic extension of p-adic numbers. This gives rise to a book like structure with rationals and various algebraic extensions of rationals taking the role of the back of the book. Note that Neper number is exceptional in the sense that it is algebraic number in p-adic number field  $Q_p$  satisfying  $e^p \bmod p = 1$ .

**Fig. 15.** Various number fields combine to form a book like structure. <http://tgdtheory.fi/appfigures/book.jpg>

For a given p-adic space-time sheet most points are literally infinite as real points and the projection to the real embedding space consists of a discrete set of rational points: the interpretation in terms of the unavoidable discreteness of the physical representations of cognition is natural. Purely local p-adic physics implies real p-adic fractality and thus long range correlations for the real space-time surfaces having enough common points with this projection.

p-Adic fractality means that  $M^4$  projections for the rational points of space-time surface  $X^4$  are related by a direct identification whereas  $CP_2$  coordinates of  $X^4$  at these points are related by  $I$ ,  $I_Q$  or some of its variants implying long range correlates for  $CP_2$  coordinates. Since only a discrete set of points are related in this manner, both real and p-adic field equations can be satisfied and there are no problems with symmetries. p-Adic effective topology is expected to be a good approximation only within some length scale range which means infrared and UV cutoffs. Also multi-p-fractality is possible.

### The notion of p-adic manifold

The notion of p-adic manifold is needed in order to fuse real physics and various p-adic physics to a larger structure which suggests that real and p-adic number fields should be glued together along common rationals bringing in mind adeles. The notion is problematic because p-adic topology is totally disconnected implying that p-adic balls are either disjoint or nested so that ordinary definition of manifold using p-adic chart maps fails. A cure is suggested to be based on chart maps from p-adics to reals rather than to p-adics (see the appendix of the book)

The chart maps are interpreted as cognitive maps, “thought bubbles”.

**Fig. 16.** The basic idea between p-adic manifold. <http://tgdtheory.fi/appfigures/padmanifold.jpg>

There are some problems.

1. Canonical identification does not respect symmetries since it does not commute with second pinary cutoff so that only a discrete set of rational points is mapped to their real counterparts by chart map arithmetic operations which requires pinary cutoff below which chart map takes rationals to rationals so that commutativity with arithmetics and symmetries is achieved in finite resolution: above the cutoff canonical identification is used
2. Canonical identification is continuous but does not map smooth p-adic surfaces to smooth real surfaces requiring second pinary cutoff so that only a discrete set of rational points is mapped to their real counterparts by chart map requiring completion of the image to smooth preferred extremal of Kähler action so that chart map is not unique in accordance with finite measurement resolution
3. Canonical identification violates general coordinate invariance of chart map: (cognition-induced symmetry breaking) minimized if p-adic manifold structure is induced from that for p-adic embedding space with chart maps to real embedding space and assuming preferred coordinates made possible by isometries of embedding space: one however obtains several inequivalent p-adic manifold structures depending on the choice of coordinates: these cognitive representations are not equivalent.

### A-6.2 Hierarchy of Planck constants and dark matter hierarchy

Hierarchy of Planck constants was motivated by the “impossible” quantal effects of ELF em fields on vertebrate cyclotron energies  $E = hf = \hbar \times eB/m$  are above thermal energy is possible only if  $\hbar$  has value much larger than its standard value. Also Nottale’s finding that planetary orbits might be understood as Bohr orbits for a gigantic gravitational Planck constant.

Hierarchy of Planck constant would mean that the values of Planck constant come as integer multiples of ordinary Planck constant:  $h_{eff} = n \times h$ . The particles at magnetic flux tubes characterized by  $h_{eff}$  would correspond to dark matter which would be invisible in the sense that only particle with same value of  $h_{eff}$  appear in the same vertex of Feynman diagram.

Hierarchy of Planck constants would be due to the non-determinism of the Kähler action predicting huge vacuum degeneracy allowing all space-time surfaces which are sub-manifolds of any  $M^4 \times Y^2$ , where  $Y^2$  is Lagrangian sub-manifold of  $CP_2$ . For a given  $Y^2$  one obtains new manifolds  $Y^2$  by applying symplectic transformations of  $CP_2$ .

Non-determinism would mean that the 3-surface at the ends of causal diamond (CD) can be connected by several space-time surfaces carrying same conserved Kähler charges and having same values of Kähler action. Conformal symmetries defined by Kac-Moody algebra associated with the embedding space isometries could act as gauge transformations and respect the light-likeness property of partonic orbits at which the signature of the induced metric changes from Minkowskian to Euclidian (Minkowskian space-time region transforms to wormhole contact say). The number of conformal equivalence classes of these surfaces could be finite number  $n$  and define discrete physical degree of freedom and one would have  $h_{eff} = n \times h$ . This degeneracy would mean “second quantization” for the sheets of n-furcation: not only one but several sheets can be realized.

This relates also to quantum criticality postulated to be the basic characteristics of the dynamics of quantum TGD. Quantum criticalities would correspond to an infinite fractal hierarchy of broken conformal symmetries defined by sub-algebras of conformal algebra with conformal weights coming as integer multiples of  $n$ . This leads also to connections with quantum criticality and hierarchy of broken conformal symmetries, p-adicity, and negentropic entanglement which by consistency with standard quantum measurement theory would be described in terms of density matrix proportional  $n \times n$  identity matrix and being due to unitary entanglement coefficients (typical for quantum computing systems).

Formally the situation could be described by regarding space-time surfaces as surfaces in singular n-fold singular coverings of embedding space. A stronger assumption would be that they are expressible as products of  $n_1$ -fold covering of  $M^4$  and  $n_2$ -fold covering of  $CP_2$  meaning analogy with multi-sheeted Riemann surfaces and that  $M^4$  coordinates are  $n_1$ -valued functions and  $CP_2$  coordinates  $n_2$ -valued functions of space-time coordinates for  $n = n_1 \times n_2$ . These singular coverings of embedding space form a book like structure with singularities of the coverings localizable at the boundaries of causal diamonds defining the back of the book like structure.

**Fig. 17.** Hierarchy of Planck constants. <http://tgdtheory.fi/appfigures/planckhierarchy.jpg>

### A-6.3 $M^8 - H$ duality as it is towards the end of 2021

The view of  $M^8 - H$  duality (see Appendix ??) has changed considerably towards the end 2021 [L39] after the realization that this duality is the TGD counterpart of momentum position duality of wave mechanics, which is lost in QFTs. Therefore  $M^8$  and also space-time surface is analogous to momentum space. This forced us to give up the original simple identification of the points  $M^4 \subset M^4 \times E^4 = M^8$  and of  $M^4 \times CP_2$  so that it respects Uncertainty Principle (UP).

The first improved guess for the duality map was the replacement with the inversion  $p^k \rightarrow m^k = \hbar_{eff} p^k / p^2$  conforming in spirit with UP but turned out to be too naive.

The improved form [L39] of the  $M^8 - H$  duality map takes mass shells  $p^2 = m^2$  of  $M^4 \subset M^8$  to cds with size  $L(m) = \hbar_{eff} / m$  with a common center. The slicing by mass shells is mapped to a Russian doll like slicing by cds. Therefore would be no CDs in  $M^8$  contrary to what I believed first.

Quantum classical correspondence (QCC) inspires the proposal that the point  $p^k \in M^8$  is mapped to a geodesic line corresponding to momentum  $p^k$  starting from the common center of cds. Its intersection with the opposite boundary of cd with size  $L(m)$  defines the image point. This is not yet quite enough to satisfy UP but the additional details [L39] are not needed in the sequel.

The 6-D brane-like special solutions in  $M^8$  are of special interest in the TGD inspired theory of consciousness. They have an  $M^4$  projection which is  $E = E_n$  3-ball. Here  $E_n$  is a root of the real polynomial  $P$  defining  $X^4 \subset M_c^8$  ( $M^8$  is complexified to  $M_c^8$ ) as a “root” of its octonionic continuation [L29, L30].  $E_n$  has an interpretation as energy, which can be complex. The original interpretation was as moment of time. For this interpretation,  $M^8 - H$  duality would be a linear identification and these hyper planes would be mapped to hyperplanes in  $M^4 \subset H$ .

This motivated the term "very special moment in the life of self" for the image of the  $E = E_n$  section of  $X^4 \subset M^8$  [L24]. This notion does not make sense at the level  $M^8$  anymore.

The modified  $M^8 - H$  duality forces us to modify the original interpretation [L39]. The point  $(E_n, p = 0)$  is mapped  $(t_n = \hbar_{eff}/E_n, 0)$ . The momenta  $(E_n, p)$  in  $E = E_n$  plane are mapped to the boundary of cd and correspond to a continuous time interval at the boundary of CD: "very special moment" becomes a "very special time interval".

The quantum state however corresponds to a set of points corresponding to quark momenta, which belong to a cognitive representation and are therefore algebraic integers in the extension determined by the polynomial. These active points in  $E_n$  are mapped to a discrete set at the boundary of cd(m). A "very special moment" is replaced with a sequence of "very special moments".

So called Galois confinement [L35] forces the total momenta for bound states of quarks and antiquarks to be rational integers invariant under Galois group of extension of rationals determined by the polynomial  $P$  [L39]. These states correspond to states at boundaries of sub-CDs so that one obtains a hierarchy. Galois confinement provides a universal number theoretic mechanism for the formation of bound states.

## A-7 Zero energy ontology (ZEO)

ZEO is implied by the holography forced in the TGD framework by general coordinate invariance.

### A-7.1 Basic motivations and ideas of ZEO

The following gives a brief summary of ZEO [L28] [K100].

1. In ZEO quantum states are not 3-dimensional but superpositions of 4-dimensional deterministic time evolutions connecting ordinary initial 3-dimensional states. By holography they are equivalent to pairs of ordinary 3-D states identified as initial and final states of time evolution. One can say that in the TGD framework general coordinate invariance implies holography and the slight failure of its determinism in turn forces ZEO.

Quantum jumps replace this state with a new one: a superposition of deterministic time evolutions is replaced with a new superposition. Classical determinism of individual time evolution is not violated and this solves the basic paradox of quantum measurement theory. There are two kinds of quantum jumps: ordinary ("big") state function reductions (BSFRs) changing the arrow of time and "small" state function reductions (SSFRs) (weak measurements) preserving it and giving rise to the analog of Zeno effect [L28].

2. To avoid getting totally confused it is good to emphasize some aspects of ZEO.
  - (a) ZEO does not mean that physical states in the usual 3-D sense as snapshots of time evolution would have zero energy state pairs defining zero energy states as initial and final states have same conserved quantities such as energy. Conservation implies that one can adopt the conventions that the values of conserved quantities are opposite for these states so that their sum vanishes: one can think that incoming and outgoing particles come from geometric past and future is the picture used in quantum field theories.
  - (b) ZEO means two times: subjective time as sequence of quantum jumps and geometric time as space-time coordinate. These times are identifiable but are strongly correlated.
3. In BSFRs the arrow of time is changed and the time evolution in the final state occurs backwards with respect to the time of the external observer. BSFRs can occur in all scales since TGD predicts a hierarchy of effective Planck constants with arbitrarily large values. There is empirical support for BSFRs.
  - (a) The findings of Mineev et al [L21] in atomic scale can be explained by the same mechanism [L21]. In BSFR a final zero energy state as a superposition of classical deterministic time evolutions emerges and for an observer with a standard arrow of time looks

like a superposition of deterministic smooth time evolutions leading to the final state. Interestingly, once this evolution has started, it cannot be stopped unless one changes the stimulus signal inducing the evolution in which case the process does not lead to anywhere: the interpretation would be that BSFR back to the initial state occurs!

- (b) Libets' experiments about active aspects of consciousness [J4] can be understood. Subject person raises his finger and neural activity starts before the conscious decision to do so. In the physicalistic framework it is thought to lead to raising of the finger. The problem with the explanation is that the activity beginning .5 seconds earlier seems to be dissipation with a reversed arrow of time: from chaotic and disordered to ordered at around .15 seconds. ZEO explanation is that macroscopic quantum jump occurred and generated a signal proceeding backwards in time and generated neural activity and dissipated to randomness.
- (c) Earthquakes involve a strange anomaly: they are preceded by ELF radiation. One would expect that they generate ELF radiation. The identification as BSFR would explain the anomaly [L23]. In biology the reversal of the arrow of time would occur routinely and be a central element of biological self-organization, in particular self-organized quantum criticality (see [L26, L80]).

## A-7.2 Some implications of ZEO

ZEO has profound implications for understanding self-organization and self-organized quantum criticality in terms of dissipation with non-standard arrow of time looking like generation of structures [L26, L80]. ZEO could also allow understanding of what planned actions - like realizing the experiment under consideration - could be.

1. Second law in the standard sense does not favor - perhaps even not allow - realization of planned actions. ZEO forces a generalization of thermodynamics: dissipation with a non-standard arrow of time for a subsystem would look like self-organization and planned action and its realization.

Could most if not all planned action be like this - induced by BSFR in the geometric future and only apparently planned? There would be however the experience of planning and realizing induced by the signals from geometric future by a higher level in the hierarchy of conscious entities predicted by TGD! In long time scales we would be realizing our fates or wishes of higher level conscious entities rather than agents with completely free will.

2. The notion of magnetic body (MB) serving as a boss of ordinary matter would be central. MB carries dark matter as  $h_{eff} = nh_0$  phases of ordinary matter with  $n$  serving as a measure for algebraic complexity of extension of rationals as its dimension and defining a kind of universal IQ. There is a hierarchy of these phases and MBs labelled by extension of rationals and the value of  $n$ .

MBs would form a hierarchy of bosses - a realization for master slave hierarchy. Ordinary matter would be at the bottom and its coherent behavior would be induced from quantum coherence at higher levels. BSFR for higher level MB would give rise to what looks like planned actions and experienced as planned action at the lower levels of hierarchy. One could speak of planned actions inducing a cascade of planned actions in shorter time scales and eventually proceeding to atomic level.

## A-8 Some notions relevant to TGD inspired consciousness and quantum biology

Below some notions relevant to TGD inspired theory of consciousness and quantum biology.

### A-8.1 The notion of magnetic body

Topological field quantization inspires the notion of field body about which magnetic body is especially important example and plays key role in TGD inspired quantum biology and consciousness theory. This is a crucial departure from the Maxwellian view. Magnetic body brings in third level to the description of living system as a system interacting strongly with environment. Magnetic body would serve as an intentional agent using biological body as a motor instrument and sensory receptor. EEG would communicate the information from biological body to magnetic body and Libet's findings from time delays of consciousness support this view.

The following pictures illustrate the notion of magnetic body and its dynamics relevant for quantum biology in TGD Universe.

**Fig. 18.** Magnetic body associated with dipole field. <http://tgdtheory.fi/appfigures/fluxquant.jpg>

**Fig. 19.** Illustration of the reconnection by magnetic flux loops. <http://tgdtheory.fi/appfigures/reconnect1.jpg>

**Fig. 20.** Illustration of the reconnection by flux tubes connecting pairs of molecules. <http://tgdtheory.fi/appfigures/reconnect2.jpg>

**Fig. 21.** Flux tube dynamics. a) Reconnection making possible magnetic body to "recognize" the presence of another magnetic body, b) braiding, knotting and linking of flux tubes making possible topological quantum computation, c) contraction of flux tube in phase transition reducing the value of  $h_{eff}$  allowing two molecules to find each other in dense molecular soup. <http://tgdtheory.fi/appfigures/fluxtubedynamics.jpg>

### A-8.2 Number theoretic entropy and negentropic entanglement

TGD inspired theory of consciousness relies heavily p-Adic norm allows an to define the notion of Shannon entropy for rational probabilities (and even those in algebraic extension of rationals) by replacing the argument of logarithm of probability with its p-adic norm. The resulting entropy can be negative and the interpretation is that number theoretic entanglement entropy defined by this formula for the p-adic prime minimizing its value serves as a measure for conscious information. This negentropy characterizes two-particle system and has nothing to do with the formal negative negentropy assignable to thermodynamic entropy characterizing single particle. Negentropy Maximization Principle (NMP) implies that number theoretic negentropy increases during evolution by quantum jumps. The condition that NMP is consistent with the standard quantum measurement theory requires that negentropic entanglement has a density matrix proportional to unit matrix so that in 2-particle case the entanglement matrix is unitary.

**Fig. 22.** Schrödinger cat is neither dead or alive. For negentropic entanglement this state would be stable. <http://tgdtheory.fi/appfigures/cat.jpg>

### A-8.3 Life as something residing in the intersection of reality and p-adicities

In TGD inspired theory of consciousness p-adic space-time sheets correspond to space-time correlates for thoughts and intentions. The intersections of real and p-adic preferred extremals consist of points whose coordinates are rational or belong to some extension of rational numbers in preferred embedding space coordinates. They would correspond to the intersection of reality and various p-adicities representing the "mind stuff" of Descartes. There is temptation to assign life to the intersection of realities and p-adicities. The discretization of the chart map assigning to real space-time surface its p-adic counterpart would reflect finite cognitive resolution.

At the level of "world of classical worlds" ( WCW ) the intersection of reality and various p-adicities would correspond to space-time surfaces (or possibly partonic 2-surfaces) representable in terms of rational functions with polynomial coefficients with are rational or belong to algebraic extension of rationals.

The quantum jump replacing real space-time sheet with p-adic one (vice versa) would correspond to a buildup of cognitive representation (realization of intentional action).

**Fig. 23.** The quantum jump replacing real space-time surface with corresponding p-adic manifold can be interpreted as formation of thought, cognitive representation. Its reversal would correspond to a transformation of intention to action. <http://tgdtheory.fi/appfigures/padictoreal.jpg>

#### A-8.4 Sharing of mental images

The 3-surfaces serving as correlates for sub-selves can topologically condense to disjoint large space-time sheets representing selves. These 3-surfaces can also have flux tube connections and this makes possible entanglement of sub-selves, which unentangled in the resolution defined by the size of sub-selves. The interpretation for this negentropic entanglement would be in terms of sharing of mental images. This would mean that contents of consciousness are not completely private as assumed in neuroscience.

**Fig. 24.** Sharing of mental images by entanglement of subselves made possible by flux tube connections between topologically condensed space-time sheets associated with mental images. <http://tgdtheory.fi/appfigures/sharing.jpg>

#### A-8.5 Time mirror mechanism

Zero energy ontology (ZEO) is crucial part of both TGD and TGD inspired consciousness and leads to the understanding of the relationship between geometric time and experience time and how the arrow of psychological time emerges. One of the basic predictions is the possibility of negative energy signals propagating backwards in geometric time and having the property that entropy basically associated with subjective time grows in reversed direction of geometric time. Negative energy signals inspire time mirror mechanism (see **Fig.** <http://tgdtheory.fi/appfigures/timemirror.jpg> or **Fig. 24** in the appendix of this book) providing mechanisms of both memory recall, realization of intentional action initiating action already in geometric past, and remote metabolism. What happens that negative energy signal travels to past and is reflected as positive energy signal and returns to the sender. This process works also in the reverse time direction.

**Fig. 25.** Zero energy ontology allows time mirror mechanism as a mechanism of memory recall. Essentially “seeing” in time direction is in question. <http://tgdtheory.fi/appfigures/timemirror.jpg>

**Acknowledgements:** I am grateful for Dainis Zeps for enlightening discussions concerning  $CP_2$  geometry.
